

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

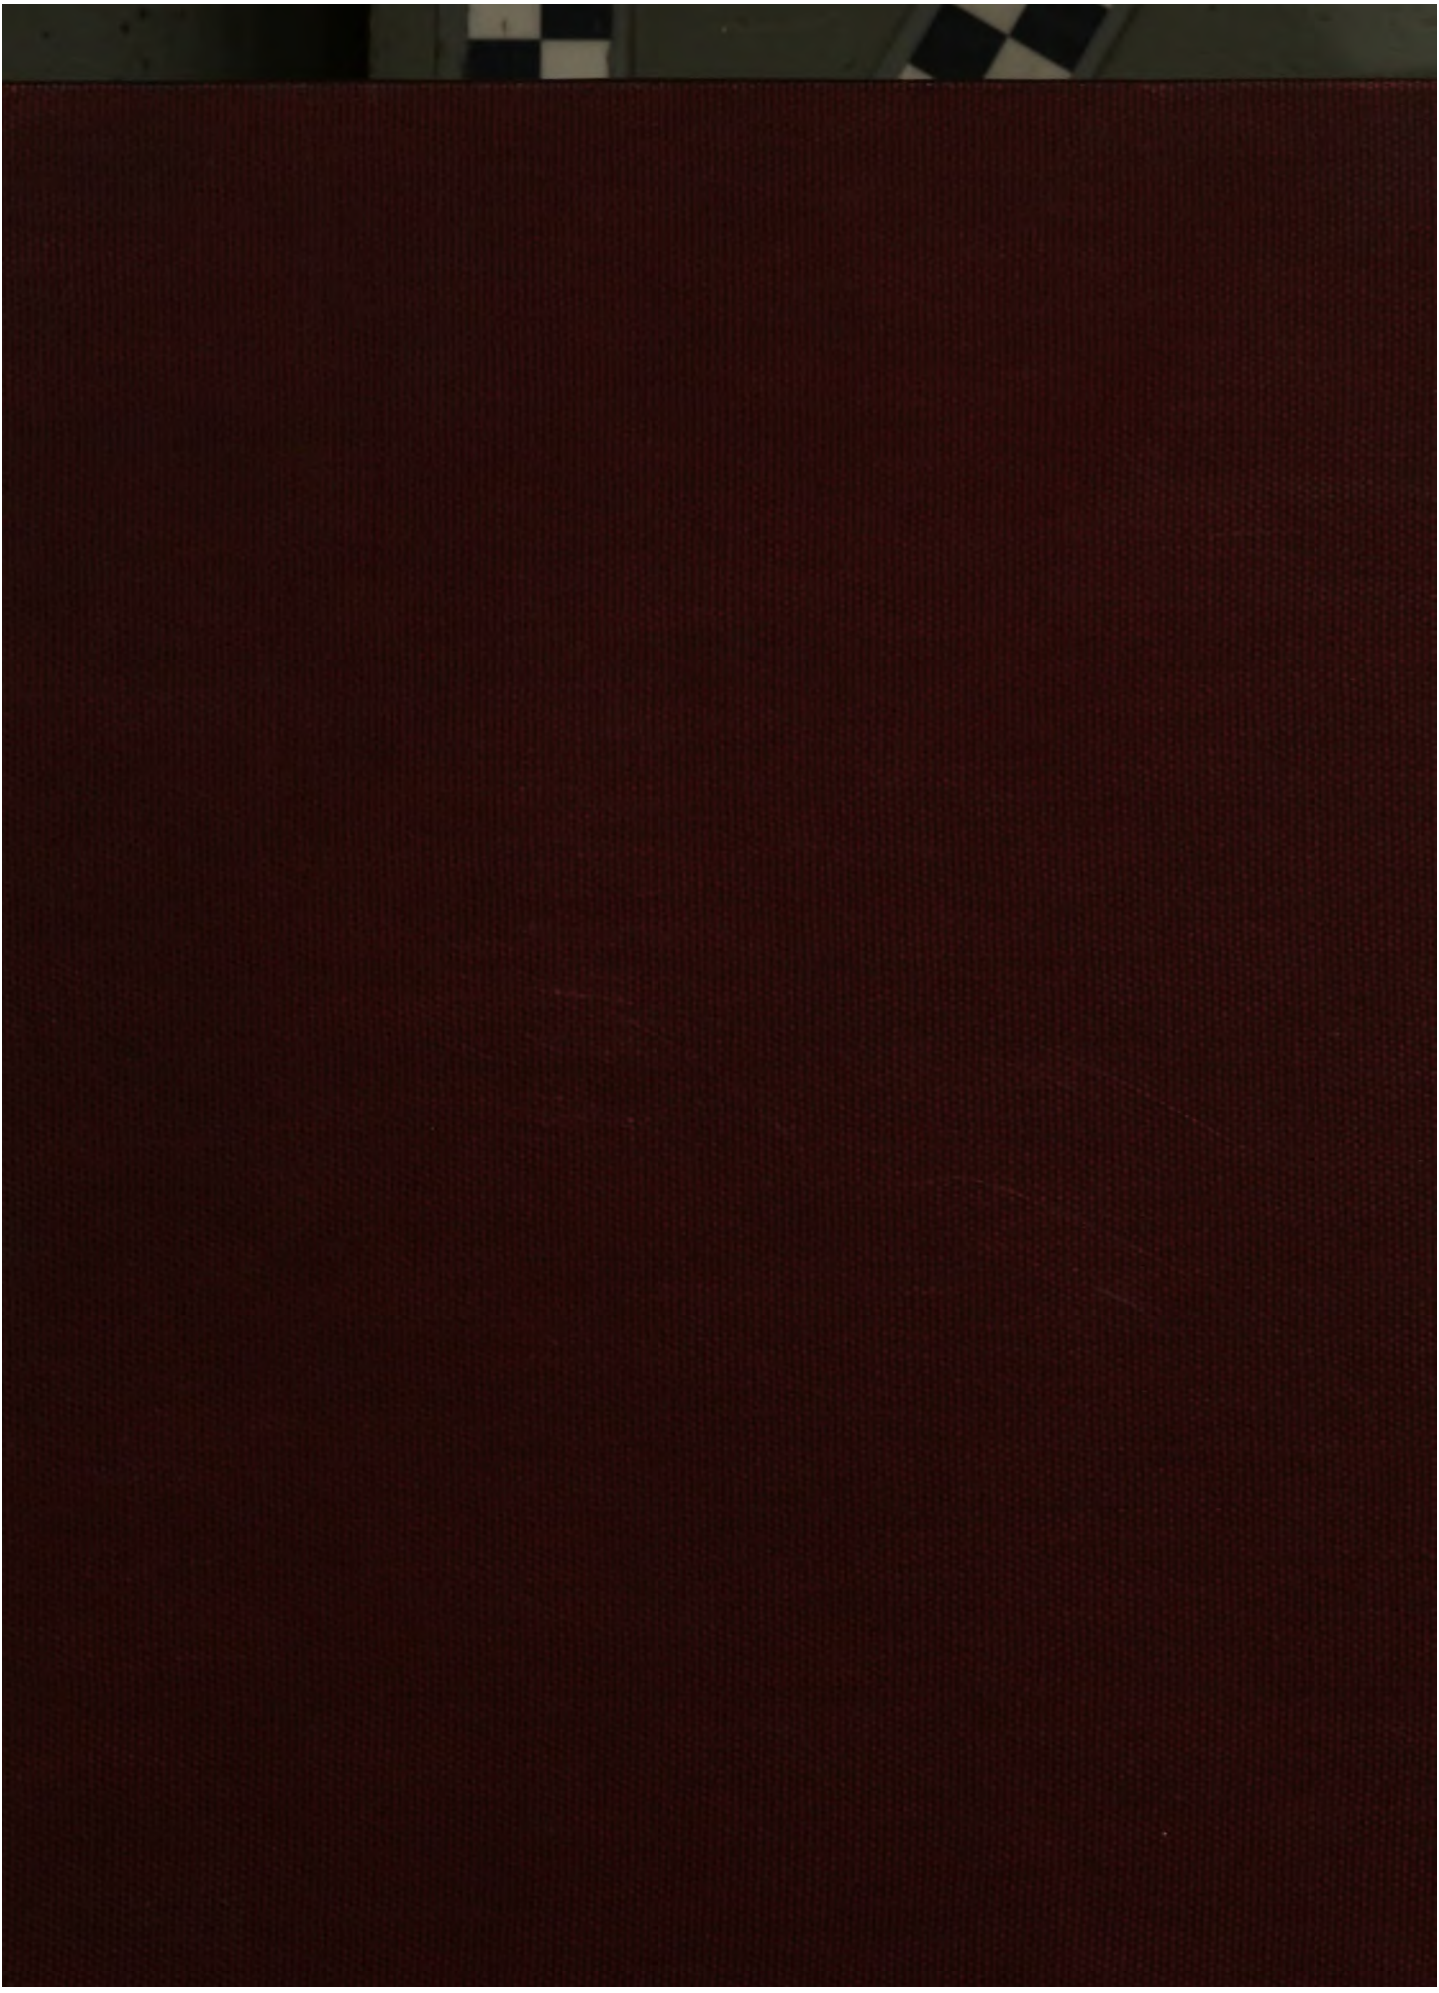
Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.



+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

TO DEALERS:

In every line the man who knows his business is the man who gets the business.
Do you know lubricating oils?
Are you guessing, or are you sure?

If you wish to improve your knowledge of scientific automobile lubrication you will learn points of distinct value by looking into Gargoyle Mobiloils.

Gargoyle Mobiloils end guess-work in motor car lubrication. They are produced by the world's leading authorities on scientific lubrication—The Vacuum Oil Company.

As no one lubricating oil will suit all cars, Gargoyle Mobiloils are produced in several grades.

Our recommendations were made after a careful study of every American make of car and most of the leading foreign makes.

Beyond any question, Gargoyle Mobiloils set a new standard in automobile lubricating oils. Their endurance is remarkable.

If you wish to handle the most efficient automobile lubricating oils procurable, in grades suited to every car you supply, you will find in Gargoyle Mobiloils what you are looking for.

In the meantime, if you should want further information on the subject, write us. We will send you a descriptive booklet and prices.

The Largest Automobile Supply House in America.

Our Name Is Your Guarantee

WHATEVER you buy from the house of Chas. E. Miller you may expect the fullest degree of satisfaction in every detail. Quality, quantity, material, workmanship, durability will be just right or we will make it right. Our name is your guarantee.

To buy from a house the size and standing of this one is the safest way to insure complete satisfaction in all your dealings. We handle goods of standard quality only and of course stand back of everything we sell.

No matter what you want in the line of automobile accessories or supplies, remember our slogan, "We Either CARRY IN STOCK, WILL GET IT—OR IT ISN'T MADE." One of the prize winners in Motor's recent advertising contest selected this as the slogan out of the many shown. His reason was as follows: "This saying is the clearest possible statement of the Miller business policy which I have found to be a fact through several years of satisfactory relations with them."

Our Annual Catalog is the largest, most complete, up-to-date and authoritative dictionary of the auto supply market of any book published. It has come to be recognized as one of the standard reference works of the industry.

The total distribution of one hundred thousand copies of this catalog practically covers the world, at least wherever automobiles are used. Nearly all foreign as well as domestic automobile manufacturers and dealers, the offices of American Consuls, Public Libraries, Universities, Y. M. C. A. Schools, Publishers, Automobile Clubs, Engineer's Offices, Purchasing Departments—in all these places you will find a copy of the Miller catalog on file.

Fifteen branches spread over the United States, located in the principal motoring centers, bring Miller service within the reach of practically every motorist in the United States. Prompt delivery, perfect quality, honest prices---these are the things that distinguish Miller service and explain the marvelous growth of this pioneer establishment since its inception in 1896.

Bosch Plugs

AS GOOD AS BOSCH MAGNETOS

THE ability of Bosch Plugs to serve you satisfactorily, irrespective of motor conditions, is assured. Their exclusive features have been adopted only after deep study and wide experience in ignition requirements proved them correct. They produce results where others fail—they keep in condition long after others are thrown away.

Automobile racing is by far the most severe test of spark plugs. During these contests they are constantly flooded with oil, exposed to extreme heat and severe vibration. Only plugs of the sturdiest construction can withstand the shocks, the smashing rebounds, the terrific strain of high compression, the intense blue flame of the burning gases which surrounds them for hours at a time. The plugs that can survive such abuse must be strong, tough, heat proof,—to the highest degree of perfection. They must be

As Good As Bosch Magnetos

Bosch Plugs have stood these strains, stood them so well, so wonderfully, that practically every race of importance run during 1911 and 1912 was won by cars employing Bosch Plugs, with the "also rans" using them too. The drivers who know—the manufacturers whose experience has taught them to provide the best they can procure for their racing cars, have universally adopted Bosch Plugs.

Actual Size

Don't be satisfied with "enough" power—use Bosch Plugs and enjoy the maximum. Let us send you our booklet "Locating the Spark Plug"; just write us a note for it.

The big tire business of the future will be Dunlop business

The GENUINE DUNLOP (Straight Side) TIRE

is destined to become the universal tire

Car owners, dealers and manufacturers are everywhere turning to the Genuine Dunlop Straight Side Tire.

The 600% increase which has taken place in our Dunlop sales during the past year is an indication of the certainty of this trend.

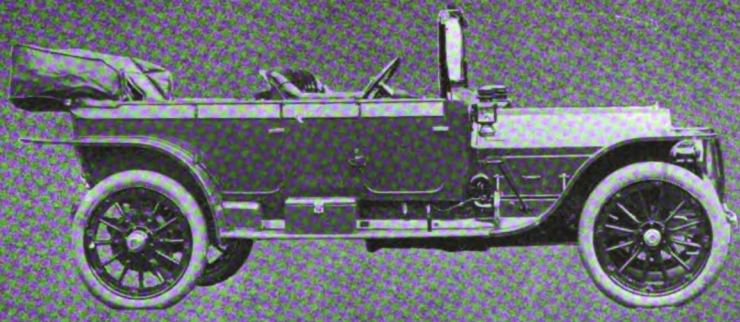
The trade in general have come to realize what tire experts have long known—that the Dunlop is the ideal type of motor car tire.

It is the easiest tire in the world to put on or take off and it is absolutely guaranteed against rim-cutting during the life of the tire.

It possesses the superior strength and durability to be found only in four-factory co-operatively-built United States Tires. In fact it possesses every point of advantage to be found in any other tire, and in addition has exclusive advantages to be found in no other tire.

But bear in mind, the Genuine Dunlop Straight Side Tire is made only by the

UNITED STATES TIRE COMPANY



Makers of the famous Nobby and Chain Tread Tires (made in three styles), including the Dunlop.

NOTE: As always the guarantee of the United States Tire Company attaches to its tires when filled with air at the recommended pressure only

What $200 Buys

By R. E. Olds, Designer

Here is a car on which I spend some $200 more than others think necessary.

It is spent to save repairs, to cut down upkeep, to insure a faultless car.

It pays for tires 34x4. Tires which cost $60 less are used on some cars of this weight.

It pays for 190 drop forgings, costing twice what castings cost.

It pays for 15 roller bearings ---11 of them Timken, costing five times as much as common ball bearings.

It pays for a $75 magneto--- for a doubly-heated carburetor--- for a centrifugal pump in place of a syphon.

It pays for big brakes, big springs---for axles and driving parts one-half stronger than necessary.

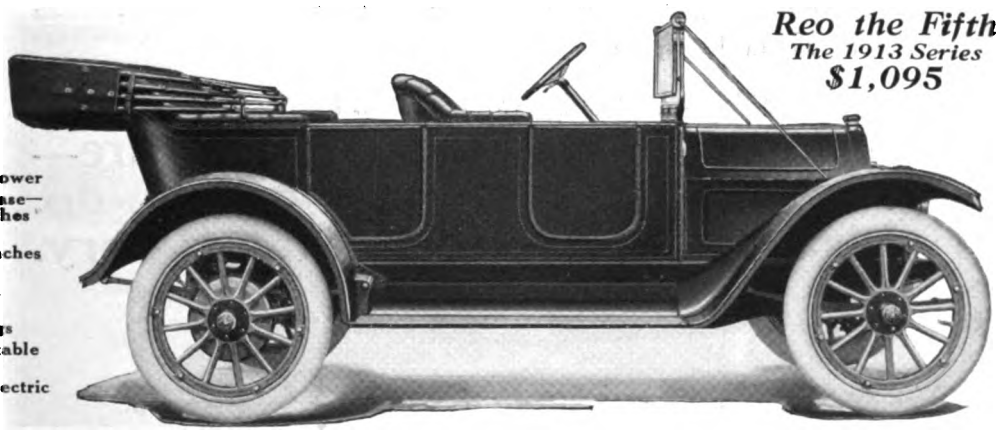
It pays for analyzed steel, for tested gears. For slow, careful building---for a thousand inspections.

It gives you a 17-coated body, genuine leather, the best curled hair.

And it saves the user from three to five times what I spend on these extremes.

Center Control

This car is controlled by a single small lever. The gear shifting is done by moving this lever only three inches in each of four directions.



No side levers, no brake levers---nothing in the way. Both brakes are operated through the foot pedals.

Left side drive with right hand control, like all up-to-date cars. But the simplest control ever known in a car.

Dealers in a thousand towns. Write for our catalog and address of the nearest.

R. M. Owen & Co. General Sales Agents for **Reo Motor Car Co., Lansing, Mich.**

Canadian Factory, St. Catharines, Ont.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).

Overland

OVER fifteen thousand Overlands have been delivered during the last five months. This is an increase of 300 per cent. over the same period last year. And last year we led every thousand dollar automobile producer in America.

This is more cars than all the automobile factories in Germany turn out in a whole year. Our 1913 sales are more than *double* those of any other manufacturer producing a similar car.

Our 1913 literature describes, explains and illustrates what we are---what we have and what we can do. It's all free. Please write the factory.

No-Rim-Cut Tires
10% Oversize
All Tiredom Records Broken

This Coming Season
Will You Still Over-Spend for Tires?

You who don't know No-Rim-Cut tires waste a pretty large share of your tire money.

Note this convincing evidence:

Men who do know bought last year 918,658 Goodyear tires. And they wanted 400,000 more.

They bought more than men bought in the previous twelve years put together.

The demand has broken all records of Tiredom, after countless mileage tests.

Now, isn't it time that you made a comparison?

Is it wise to face, for another season, blow-outs and rim-cuts and waste?

The evidence is that No-Rim-Cut tires save close to half of one's tire money. Stop and consider what that means to you.

If you question such savings, make mileage tests. And remember that hundreds of thousands have made them, with some two million Goodyear tires.

Look at This Tire

You can see that rim-cutting is made completely impossible.

There are no hooks on the base as with old-type tires. The removable rim flanges are set to curve outward.

The tire, when wholly or partly deflated, rests on a rounded edge.

The tire is held on by our patented feature—by six flat bands of 126 braided wires vulcanized into the tire base. That makes the tire base unstretchable. The tire can't be forced off, and yet it slips off like any quick-detachable when you remove a rim flange.

We control the only way known to make a satisfactory tire of this type.

See the Oversize

You can see that these tires are oversize, compared with clincher tires.

We claim but 10 per cent. But careful comparison of air capacity shows an actual average oversize of 16.7 per cent. We compared with six makes of clinchers.

Even 10 per cent. oversize, under average conditions, adds 25 per cent. to the tire mileage.

See the Non-Skid

Compare this Non-Skid with all other non-skids. You can see for yourself the tremendous advantages.

Note that we here add a complete extra tread, making a double-thick tread.

This extra tread is a very tough rubber. So the non-skid feature is immensely enduring.

The blocks are deep-cut and sharp-cut. Countless edges and angles grasp the road surface with a bull-dog grip.

Then these blocks widen out so they meet at the base. They don't center the strains on a part of the fabric. They distribute the strains as with smooth-tread tires. That means a long-lived tire.

Five minutes spent in a Goodyear shop will convince you that these things mean less tire cost.

What Mileage?

We can't prophesy the mileage, beyond our warrant, which you'll get from No-Rim-Cut tires.

That depends too largely on things we can't control. It depends on tire size as compared with car weight. It depends on roads and usage.

We can only say how the mileage compares with other tires under the same conditions. And that you can prove by comparison.

Statistics show that 23 per cent. of all clincher tires become rim-cut. Our patent tire never does.

Usage proves that 10 per cent. oversize, with equal tires, adds 25 per cent. to the tire mileage.

Reason will tell you that double-thick non-skids, with the strains distributed, will outlast the common non-skids.

Now we ask you to learn, by odometer test, what all this means to you.

Do It Now

Don't go on paying excessive tire upkeep, if this way really ends it.

Tires should be judged by the cost per mile. Else what is the use of working out these economies?

Here are tires that can't rim-cut. Here are oversize tires. Here are double-thick non-skids. Reason says they ought to save money. Legions say they do. And these tires, on sheer merit, now outsell all others.

You owe yourself a trial of such tires.

Write for the Goodyear Tire Book—14th-year edition. It tells all that we know, after 14 years, about cutting down tire expense.

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

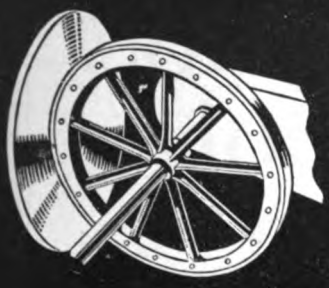
This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00



MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals, and our special nine passenger body.

Write for complete description and any information you may desire in regard to our two-speed axle.

The Gearless Transmission!

For ten years this simple, reliable car has been growing steadily in popularity. Today it is found giving perfect service in every section of the country. It offers advantages which are impossible in the gear car—and these advantages mean the very utmost in service and satisfaction for you.

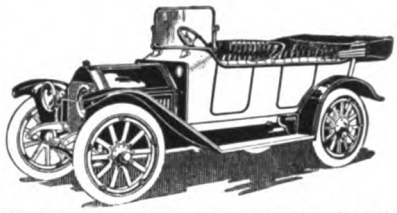
A Cartercar Will Save 1-3—1-2 Your Tire Bills!

There are no jerks or jars in starting or stopping—and this means that much of the hardest wear on the tires is eliminated. Tires are the big item in the upkeep expense of the ordinary car.

And you know that this smooth, easy running must mean remarkable comfort for the passengers. Then, too, the very deep upholstering and resilient springs make the Cartercar as comfortable as any car can possibly be.

Think of Climbing 50% Hills!

The great economy of power secured by the gearless transmission makes it possible for the Cartercar to easily climb the steepest hills and to simply play through deep mud and sand. No gear car can offer such service.



Another advantage is the unlimited speeds. And all with a simple one lever control. Compare this with the four of the gear car.

Of course, all Cartercars are Electrically Started and Lighted. Both of these operations are controlled by a little knob on the front of the driver's seat. This and all other equipment is included in the regular prices.

Do you want a car for dependable service—all the time? Then consider the exclusive advantages offered by the Cartercar. Catalogue now ready.

Based on a Principle

Centrifugal Force

What Are You Measuring--- Speed or Magnetic Influence?

Accuracy demands that you measure speed by something definitely related to speed.

Speed of rotation and centrifugal force are inseparably related. One is impossible without the other. Every speed has a definite, unvarying value of centrifugal force. Every centrifugal force has a definite, unvarying value of speed. One means the other---both mean the same.

THE JONES SPEEDOMETER

measures speed by centrifugal force---the unvarying, scientific relation accounts for the permanent accuracy of our investments.

Magnetic instruments are not permanently accurate. Magnetism has absolutely no relation to speed. Each can be had without the other. Neither is connected or related to measure the other. Magnetic speedometers convert speed into magnetic energy, magnetic energy into movement of the dial. Every conversion of energy involves loss. Every magnetic instrument is disturbed and rendered inaccurate by the temperature, electrical and magnetic disturbances in the car.

The Jones Speedometer is geared-to-the-truth. It is not actuated or controlled---excited or impelled ---induced or swayed by anything but speed. Centrifugal force always tells the speed truth.

Comparison proves the dominating quality of the KisselKar

COMPARE the KisselKar with cars of highest price and best reputation, and let your comparisons be on quality, not on price.

Such comparison is advantageous to the KisselKar, because the KisselKar, beyond doubt, embraces all the quality that modern engineering, modern factory facilities and high standards can put into a car.

It is the maximum product of modern motor car construction, produced by a skilled organization with every facility for economy production, and with no dead weight costs to go into the prices.

Every dollar of KisselKar price represents quality in the car—and no car is better constructed, and few so liberally designed as the KisselKar.

In appearance the KisselKar is the car of superb distinction.

It offers the widest possible range of throttle control.

It will drive on high (fourth geared-up speed) as fast or slow as you need going in all ordinary driving. The tonneaus are roomier, the seats deeper than in any other car.

In every refinement of appointment and finish, the KisselCar meets the highest standard.

1500 lb., 1, 1¼, 2, 3, 4, 5-Ton Trucks, Delivery Cars, Fire Department Apparatus, etc. Write for big illustrated truck catalog.

INVADER OIL

Announcement

REGISTERED

Mr. T. E. Tomlinson has joined forces with Charles F. Kellom & Co., makers of INVADER OILS, the oldest and best known brand of automobile oils on the market, and in the future these will be manufactured and sold by a corporation known as THE INVADER OIL CO.

To Mr. Kellom's existing organization will be joined Mr. Tomlinson's old selling force so long associated with him and so well known to the trade.

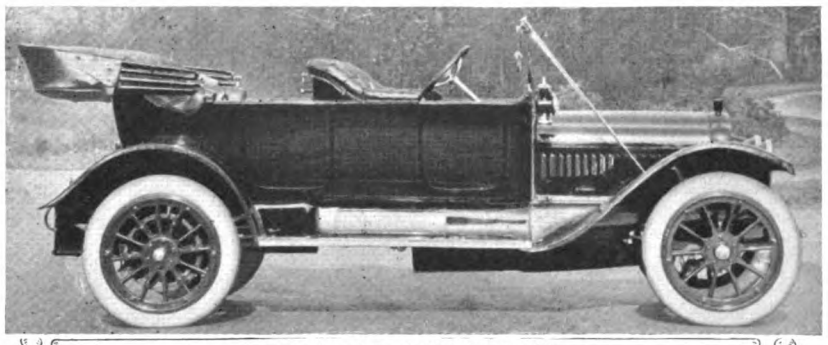
Increased facilities for distribution have been provided to insure prompt deliveries.

Under the brand **INVADER** will be marketed the best oils in the world.

INVADER OIL COMPANY

Lessees of CHARLES F. KELLOM & COMPANY

Main Office: 80 Broad Street, New York City



PHILADELPHIA BRANCH:

WHITE FIVE PASSENGER SIX
Electrically Self-Started and Lighted

THE WHITE SIX

Electrically Started and Lighted—Left Side Drive

The purchaser of a high-priced car has the right to expect superior design and equipment as well as superior material and workmanship.

The White was the first Six to introduce left-side drive, and today presents this logical method of control in its most desirable form—with right-hand operation of the gear-lever.

The White was the first Six to incorporate in its equipment an electrical starting and lighting system. The White Electrical System is designed and built by The White Company, in The White Factory, especially for White Cars. The White is the only Six today equipped with an electrical system that is manufactured by an automobile company especially for its own product.

VOL. XXXV, No. 1 FEBRUARY 10, 1913 Price, $1.00 the Year

FOUR STRUCTURES FOR CHICAGO SHOW.

Twenty-One New Makes Revealed in Western Metropolis, Adding Thirteen Sixes to the Season's Models---Electrics Departmentalized for First Time.

SOME 400 pleasure cars, reaching a total estimated value of $3,000,000, were displayed at the 13th annual automobile show in Chicago during the first week, Feb. 1-8. Four structures, including the Coliseum, Annex, First Regiment armory and the Wilson building, were utilized. General Manager Samuel A. Miles of the National Association of Automobile Manufacturers, under whose management all of the Chicago shows have been held, predicted that 400,000 people would visit the display during the week and that the total sales would aggregate $6,000,000. Complete figures are not yet available, and it is impossible to indicate whether this prediction was fulfilled.

Interior of the Coliseum During Progress of 13th National Chicago Show.

It would appear that the management left no stone unturned to make the exhibition a splendid success. Throughout the week special rates on the railroads leading into Chicago acted as an added inducement for the people of that section to visit the western metropolis. The doors were opened to the trade at 1 in the afternoon of Feb. 1, opportunity being afforded at that time for visiting deal-

Digitized by Google

ers to inspect the new models in advance of the general public. Several special trains brought these men to the city, and they were met by a large delegation of men from the various factories represented in the display. It must not be understood that the efforts to interest dealers and in securing new agencies were confined to that one afternoon, but it does appear that the show took on a more retail aspect after the public opening at 6:30 that evening.

There was not the same reason for confining efforts to an attempt to interest dealers that has been true in former years. The so-called minor show circuit of the Middle West, or a substantial portion of it, has been raised to the dignity of a national circuit this year. Cities which have appeared much larger than that at New York. The figures bear out this statement. While the list of exhibitors totalled about the same in both instances, approximately 500, there were 102 who displayed pleasure cars as against 88 for New York. This would seem to indicate that there were but 14 new makes shown at Chicago, but some of those who were represented at the eastern display failed to secure suitable space at Chicago. The total of new makes was 21, of which 11 were electrics.

Speaking in a general way, practically the same characteristics were manifested at both shows. The list of six-cylinder gasoline models was increased by 13, this including the K-R-I-T six, which was displayed for the first time at

General View of the Main Floor of the Chicago Coliseum, as Seen from Near the Entrance, During the Recent Pleasure Vehicle Display.

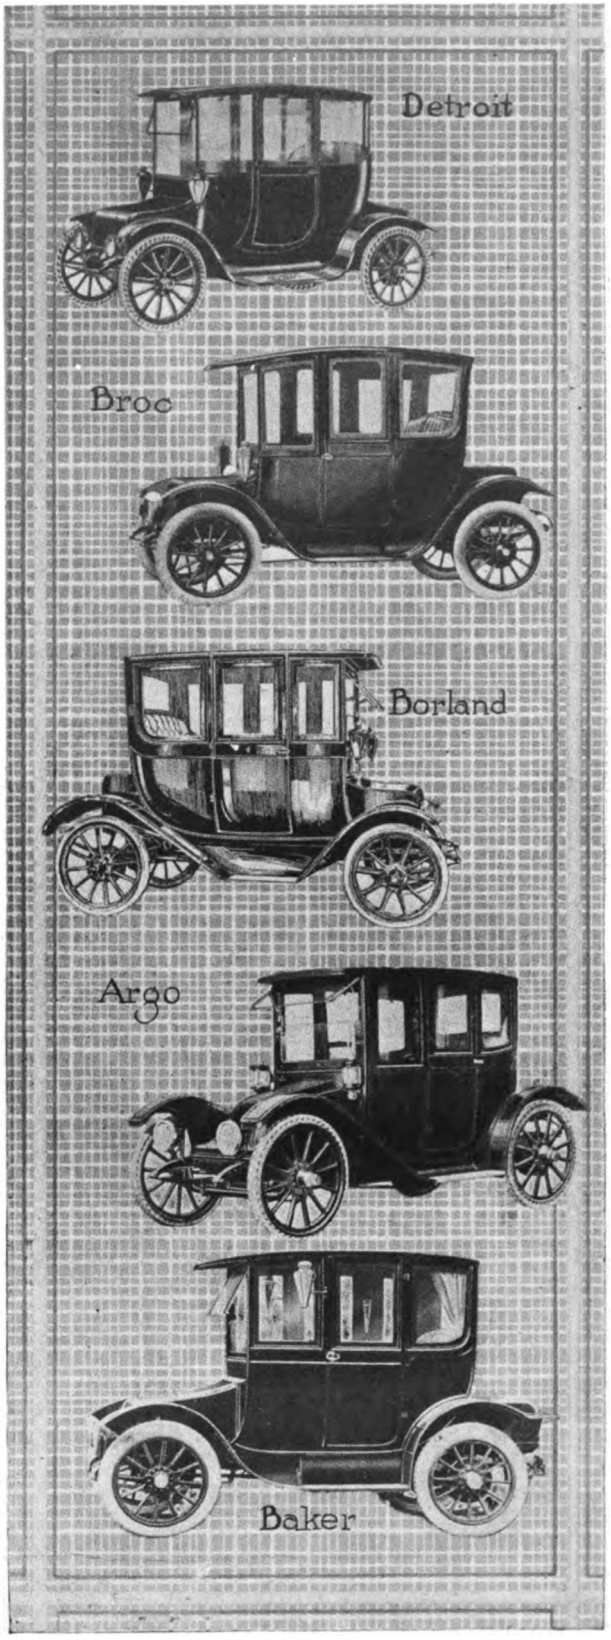
been obliged to wait, heretofore, until after the Chicago display before holding their local exhibitions, already have had opportunity to inspect the season's models, many of which have been supplied by the sales departments of the concerns exhibiting at Chicago.

For some years past there has been a noticeable tendency toward elaborate decorations, particularly in the Coliseum. This year the general treatment was of a character much more simple, although the effect was quite as marked as ever. There was much better opportunity to view the machines as an assembly than was true in 1912, for instance, and this undoubtedly made for a more general comparison of the various models.

In the matter of numbers, the Chicago display any show. Wire wheels, electric starting and lighting, and the installation as regular equipment of many accessories and fittings formerly regarded as extras were quite as much in evidence as in the East. The new gasoline makes were: Austin, Colby, Crow Elk-Hart, Glide, Great Western, McFarlan, McIntyre, Midland, Pratt and Staver.

In some respects the display of the Austin Automobile Company, Grand Rapids, Mich., was the most radical feature of the show, because of the fact that the Austin is utilizing a two-speed rear axle this year. This axle provides two different gear ratios, both on the direct drive, and in combination with the three-speed transmission gives six speeds forward and two reverse.

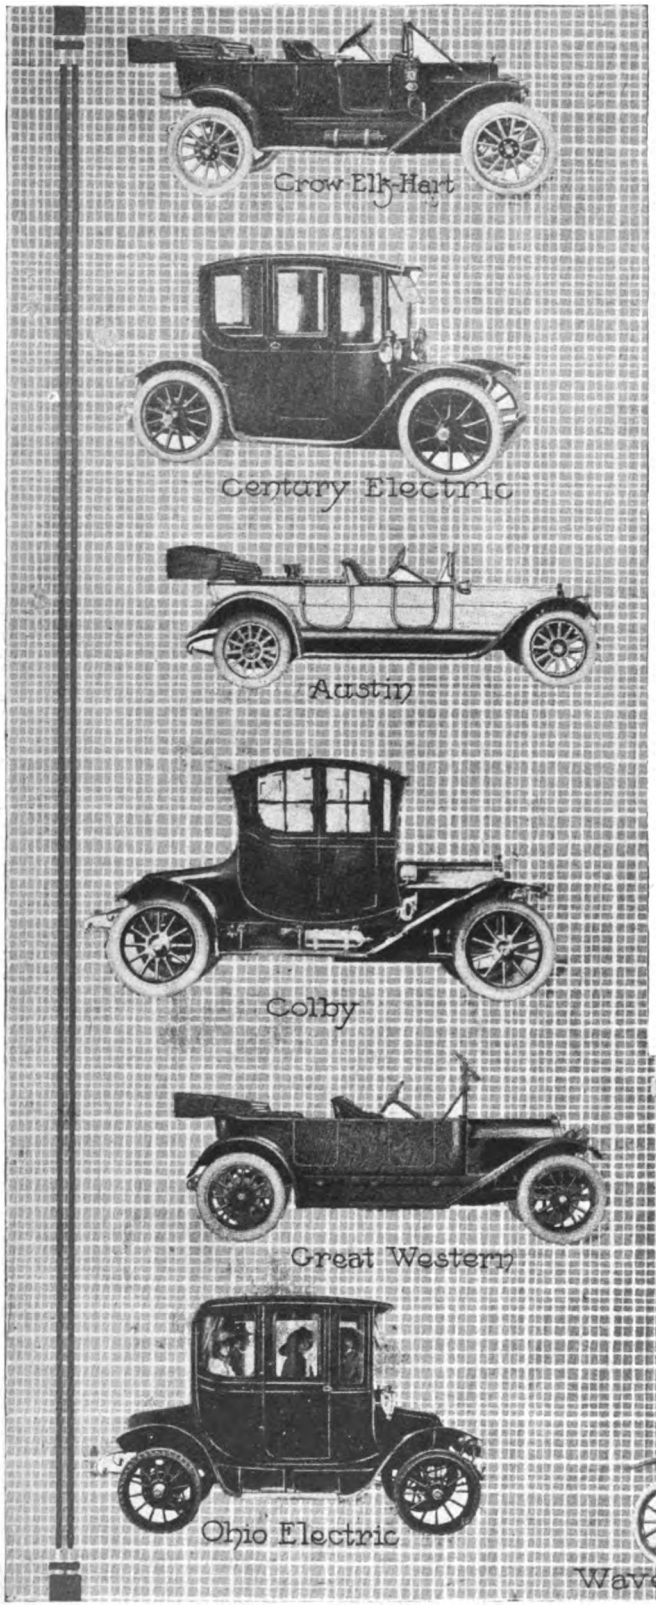
Digitized by Google



Special attention was given to the display of electric vehicles, these being allotted space together in the First Regiment armory, instead of being intermingled with the gasoline cars as in former years. This was a plan which proved decidedly satisfactory to the manufacturers and those interested in this type of vehicle. Chicago is in the centre of a large district where electrics have been used with decided success, and where the sales have been much larger than in some other sections. It is not surprising, therefore, that this part of the show should have awakened deep interest.

Eleven makes that were not seen in New York were shown at the Chicago display. This means a total of 16, for only five were exhibited at the Grand Central Palace last month. The 11 were: Argo, Baker, Borland, Broc, Century, Chicago, Detroit, Ohio, Rauch & Lang, Waverley and Woods. These are illustrated herewith, as are the 10 gasoline makes exhibited for the first time at a national show this year in that city. The specification details are presented in tabulated form on another page.

The display of accessories was most complete, although several exhibitors who were seen at New York were added to the list of those who held private shows, through inability to secure space or for some other reason. To offset this deflection, as always has been true of the Chicago show, numerous accessory houses located in the Middle West were represented. Some of these never have made effort to exhibit their product at shows in the East.



This separate show feature was undertaken by a few automobile manufacturers as well. The Ford Motor Company always holds a show of this character during the Chicago exhibition, and this year this concern was joined by the Marion Motor Car Company, Empire Automobile Company and Apperson Bros. Automobile Company. The last named was not represented at the New York exhibition, and the same thing may be said with reference to the Ford.

In addition, two entirely new cars were revealed at private shows, one of these being the Howard, made by the Central Motor Car Company, Connersville, Ind., and the other the Chandler, produced by the Chandler Motor Car Company, which is composed of former officials of the Lozier Motor Company, Detroit. Both are six-cylinder machines. It is understood that the Chandler company will locate in Cleveland, although this decision has not been made as yet. The Central company is occupying the former plant of the Lexington Motor Car Company.

MANUFACTURERS DISCUSS NATIONAL SHOWS.

ONE of the matters under general discussion among motor car manufacturers and others in the industry during the first week of the Chicago show was the proposition involving the abandonment of national shows in the future. The plan seems to have resolved itself into a question of making the New York and Chicago displays dealers' exhibition of much the same nature as the annual Boston show, with the exception that the manufacturers would assist the local men in somewhat the same manner they are aiding them in those cities placed on the national circuit this year.

It develops that Albert L. Pope, president of the Pope Manufacturing Company, Hartford, Conn., addressed a personal letter to the members of the National Association of Automobile Manufacturers Jan. 25, the closing date of the second section of the recent New York show, in which this proposition was suggested. Because of the fact that Col. George L. Pope, chairman of the Automobile Board of Trade show committee and one of the men who has had charge of the arrangements for the New York display for some years, also is a member of the same firm, his name has been confused with that of the writer of the letter, a copy of which follows:

I have been giving the matter of automobile shows in general a great deal of consideration lately and have thought it over from every standpoint and wondered in my own mind how long this industry of ours could stand such expense as automobile shows in general entail.

The past week I have been more impressed than ever at the Madison Square Garden show as to the matter of expense, for the automobile industry in general pays for it. Last year I understand gate receipts paid by the public at Madison Square Garden were only 40 per cent. of the total. It is too early at this writing to say what they will be this year, but in all probability they will be somewhat less. The trade in general paying for and giving away the tickets not only pays the rent and decorations, but a large part of the patronage as well.

The disorganization of your factory and sales department and business in general during the weeks of the show is a serious matter and I think one that will have to be reckoned with in the near future by the automobile industry. The money in addition that is left with the hotels in New York and other cities is another serious point.

Now the situation resolves itself right down to this: Can the automobile industry stand the expense of these shows with all its ramifications?

As soon as the automobile show is in progress of promotion it is merely a signal for all newspapers and publications of every kind to attempt to get from the automobile manufacturers advertising and this year it seems to me that it has been worse than ever.

Several prominent men in other lines of business have commented to me in the last week as to the expense of the automobile show and have not hesitated to make the statement that the business they were in could not stand any such expense. I think we are beginning to be seriously criticised by the public and I feel that it is a question that ought to be discussed thoroughly from all points of view and if for any reason it should be deemed wise by a majority to discontinue shows this is the time to take the matter up because in the very near future the association will be making leases and arrangements for shows in 1914.

If you feel as I do, that shows should be discontinued, or at least the matter thoroughly discussed by the manufacturers, will you kindly write a letter to the National Association of Automobile Manufacturers, 7 East 42nd street, New York, requesting them to call a meeting of their members for a discussion of this matter in the very near future, so that if it is determined that shows be discontinued during 1914 we may be in a position to notify all those who are now interested to discontinue their preparations so far as we are concerned as manufacturers.

It will be noted that no mention is made in this letter concerning the accessory houses—members of the Motor & Accessory Manufacturers and others who have assisted in holding the New York and Chicago shows. These men, particularly members of the association named, also have exhibited at the Boston show as manufacturers. They are able to appreciate the value of each type of exhibition, and the opinion of one of them is voiced by Chas. E. Miller of New York City, the pioneer accessory man in this country and one of the members of the committee which arranged for the first show in that city in 1900. Mr. Miller says:

"Show me" was the handwriting on the wall as revealed at the fortnightly national double show in New York. What I mean by this is that our national New York show is now such in name only, because all the products have been shown and in use for months previous to the opening of the displays. Hence, the exhibitions themselves are no longer maker's shows, but dealer's shows; who retail directly to the user.

If the New York exhibition were a local show like the big Boston display, the local dealers, branch houses and jobbers in supplies could control it. Then the show could be held in one building, the profits going directly to the dealers, for certainly the makers have no license to be in the show business for profit. All the makers would need to do would be to furnish the sample cars and do the big metropolitan advertising.

The motor business wagon show should be held out-of-doors, in the late summer or early fall, so that practical demonstrations of loading and unloading, for example, could be held. This would indicate the real value of the product to intending purchasers.

Still another phase of the situation has been brought to light, although it cannot be said that it is entirely new. This is a suggestion that there be one national show held in Detroit, say in July, when the new models are announced. Something of this nature was offered a year ago, but at that time it was discovered there was by no means any definite period of the year when new cars were being introduced. Since then there has been general discussion of the yearly model question, but as yet no agreement has been reached.

Several manufacturers have expressed themselves very forcibly concerning the show situation, and while the opinion thus far disclosed can-

Digitized by Google

not be said to be unanimous, there apparently are a large number who agree with the suggestion as outlined by Mr. Pope. It is probable that much more will be heard relative to this matter in the near future. Feb. 5 the N. A. A. M. executive committee decided to hold a 1914 Chicago show.

TIRE PRODUCERS ADOPT NEW GUARANTEE.

DURING the progress of the recent New York show the Motor & Accessory Manufacturers adopted a new form of tire guarantee, the published wording of which is as follows:

We guarantee all pneumatic motor car tires, bearing our name and serial number, to be free from imperfections in material and workmanship. Tires returned for consideration under this guarantee will be accepted only when all transportation charges are prepaid. If, upon examination, it is our judgment that tires are defective, they will be repaired or replaced at our option.

When tires are replaced by us, charges will be made to owners at the time new tires are delivered, for such amounts as in our judgment will compensate for the service rendered by such replaced tires.

Tires worn out in usual or unusual service, abused knowingly or unknowingly, misused, used on rims not bearing these stamps (———) injured through accident or design, are not covered by this guarantee.

(Name of tire) pneumatic motor car tires are not guaranteed to give any definite miles of service, and any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights in excess of those for which the various tires are recommended, or who does not keep tires inflated to the pressure recommended by us.

Not all tire producers are members of the Motor & Accessory Manufacturers. Even among those who are members there does not appear to be an agreement with reference to the effect of the action taken at New York. The Automobile Journal has asked all the leading makers to state their opinion concerning the new guarantee and its effect upon the tire industry. Some of these have responded as follows:

You have evidently confused the action of the tire makers in connection with not guaranteeing their tires when any substitute for air is used therein. There is just exactly as good and valuable a guarantee on tires today as there was one week ago. There has been absolutely no change in connection with same.

If you will read the advertising being run by most of the leading tire makers, you will find the guarantee in question therein, and it speaks for itself. It is simply a protective measure of tire makers to do away with the abuses that they have suffered under a guarantee by the use of injurious fillers and attachment of tires to rims not properly inspected, proving them to be suitable for use in connection with tires.

Yours truly,
B. F. GOODRICH COMPANY,
By H. E. RAYMOND, Second Vice President.
Akron, O., Feb. 3.

We do not believe in mileage guarantees for the reason that the properties entering into the use of a tire which determine the mileage that it ultimately gives are not only indefinite, but absolutely beyond the control of tire manufacturers, which necessitates the placing of a mileage guarantee so low to protect against the abused tire, that it is of little value to the careful user.

If a given quality of tire would give a uniform service in miles, a mileage guarantee would be advisable, but let us assume that there are 1000 tires exactly alike placed in service at the same time, the mileage that they give even in the event there are no accidents will vary in accordance with the individual conditions to which they are subjected—several hundred per cent.—which fact is unavoidable and makes impossible a rational mileage guarantee.

A guarantee coupled with the close price competition sets a wrong standard for the direction of the manufacturer's efforts. It offers an incentive to build a tire down in quality that it may be sold at a competitive price until with proper use it will just cover the mileage guarantee, rather than the proper incentive, which is the highest economy and the highest quality which it is physically possible to incorporate in an automobile tire.

Very truly yours,
KNIGHT TIRE & RUBBER COMPANY,
By O. HIBNER, Sales Manager.
Canton, O., Feb. 5.

We understand that this matter was taken up at a recent meeting of the tire manufacturers' section of the Motor & Accessory Manufacturers. We understand that the members present decided to withdraw from the custom which has heretofore prevailed of making adjustments upon a 3500-mile basis. We, however, do not expect to alter our present policy, as we are quite satisfied to maintain the guarantee of 4000 miles for our Vacuum Cup tires and 3500 miles for the plain tread tires.

While we are members of the Motor & Accessory Manufacturers, we are not compelled to adopt the policy which the majority has agreed upon.

Yours truly,
PENNSYVANIA RUBBER COMPANY,
By H. W. DUPUY, President-Treasurer.
Jeannette, Penn., Feb. 3.

Owing to the late arrival of other letters it is impossible to reproduce them at this time. It is anticipated that the subject is one in which both manufacturers and users will be interested deeply, and the discussion will be continued in another issue.

NEW DEPARTURE EXHIBIT.

Ball Bearing Shaft Hangers Shown for First Time at Private Display in Chicago.

The New Departure Manufacturing Company, Bristol, Conn., maker of ball bearings, etc., was not represented at the Coliseum show in Chicago this year. Instead a private display was maintained at the Congress hotel.

A feature of this exhibit was the New Departure ball bearing shaft hangers, brought out by this company for the first time. In addition, a demonstration of the anti-friction quality of the New Departure bearings was given in an interesting manner by a moving exhibit of ball bearings in action, with the sides cut away in such manner as to show the almost infinitesimal point of contact between the balls and races.

REGISTRATION INDICATES A MILLION CARS.

WHILE it is impossible to secure complete figures regarding the registration of automobiles and motorcycles in all of the 48 states of the Union, as some commonwealths have no registration law and the licensing of cars in others is by local ordinance or with county officials, statistics from 37 states and the District of Columbia show that there were listed 970,327 vehicles at the close of 1912. It will be admitted that in certain instances these figures will include some duplication of cars, but when the number of machines in use in the other 11 states is taken into consideration, this will be more than offset. The conclusion must be that there are now in use in the United States more than 1,000,000 motor vehicles.

Photo Copyrighted, Underwood & Underwood, New York.
Motor Traffic on Fifth Avenue, New York City.

The information contained in the accompanying tabulation was secured by The Automobile Journal from every state official of jurisdiction save two. In one instance the figures are the statement made by the manager of a leading commercial body in a state which does not require registration by law. The classification is as it appears on the books of the state officials, and it will be noted that in some instances this is with all types of vehicles in one list, while in others there has been distinct attempt to keep a separate listing.

It will be seen that there are no entries for the states of Arizona, Colorado, Florida, Idaho, Kansas, Louisiana, Nevada, Oklahoma, South Carolina, Texas or Wyoming. The District of Alaska and the Insular possessions also are omitted. Local ordinances exist in Colorado, Louisiana and Wyoming, but only in a few cities. In Texas registration is with the county clerks and in South Carolina with the clerks of the county courts. There are no registration laws in the other states named, save Florida and Oklahoma, from which no returns were received. The figures for Montana are those supplied by the manager of the Commercial Club of Helena, and are regarded as conservative.

While it is true that some machines have been

Digitized by Google

registered in two states, these comprise a comparatively small percentage. Taking Massachusetts as an example, there were 881 licenses issued to non-residents in 1912, or about 1.51 per cent. It may be stated that this number is not included in the accompanying tabulation for that state, but if the same ratio were to hold throughout the country the total result would not be effected materially.

There is one other point which must be taken into consideration. In some states perpetual registration is still in vogue, while in others the life of a registration is three years instead of one. It would be impossible to arrive at an exact determination of the cars in use in these commonwealths without analysis of each state law. There seems little doubt, however, that when allowance is made for all duplications, the number in service in the 11 states not included in the tabulation will not be equalled. The conclusion that there are at present 1,000,000 motor vehicles in use in the United States must be regarded as conservative. Incidentally, the figures presented offer opportunity of possibilities for future business.

MAXWELL MOTOR COMPANY.

Declaration of Policy Made by Reorganized United States Motor Company.

The reorganization of the United States Motor Company appears to have been fully accomplished, and the name of the new concern has been decided definitely as the Maxwell Motor Company, Inc. As is more or less well known this concern has acquired the property of the Maxwell-Briscoe Motor Company at Tarrytown, N. Y.; Auburn, R. I., and Newcastle, Ind.; Brush Manufacturing Company, Detroit; Alden Sampson Manufacturing Company, Detroit; Dayton Motor Car Company, Dayton, O.; Briscoe Manufacturing Company, Detroit, and Columbia Motor Car Company, Hartford, Conn. These were constituents of the old United States Motor Company. It also has purchased the organization and business of the Flanders Motor Company, Detroit, formerly the Metzger Motor Car Company.

It is announced that the Maxwell Motor Company, Inc., will produce four models for the coming year, these to be known as: Maxwell Six, models 40 and 50, formerly the Everett and more recently the Flanders, and the Maxwell, models 25 and 35, four-cylinder machines. In addition, for the present at least, the regular Maxwell, models 22 and 40, and the Stoddard-Dayton, models 30, 38 and 48, will be continued. The present owners of the Stoddard-Dayton, Brush, Everett, Columbia, Sampson and Maxwell, will be cared for by the factory at Newcastle, Ind., which has been set aside for the purpose of manufacturing and supplying repair parts for these machines.

The country is to be divided into a number of districts, to be in charge of district sales managers as follows: Boston, Ralph Colburn; Chicago, P. J. Pollock; St. Louis, C. G. Jackson; Minneapolis, O. W. Klose; Kansas City, C. S. Wright; Dallas, Tex., J. W. Shelor; Omaha, J. M. Opper; Atlanta, branch house; New York, C. F. Redden; Philadelphia, E. G. Oliver; Charlotte, N. C., A. Burwell, Jr.; Pittsburg, E. M. Green; Indianapolis, F. B. Willis; Memphis, Charles Booth; Denver, D. S. Eddins; San Francisco, C. R. Newby; Los Angeles, C. E. Stebbins; Portland, Ore., L. H. Rose.

The officers of the new company are: President, Walter E. Flanders; vice president, W. F. McGuire; comptroller, W. B. Anthony; commercial manager, C. A. Forster; treasurer, Carl Tucker; board of directors, James C. Brady, Harry Bronner, Eugene Meyer, Jr., Henry Sanderson, William E. Potter, George H. Burr, W. Catchings, William J. Maloney, W. F. McGuire, Walter E. Flanders. The general offices are at the corner of Woodward avenue and Warren street, Detroit.

WILL HANDLE MAXWELL ACCOUNT.

E. LeRoy Pelletier, Well Known Advertising Man, Also Interested in Starter.

According to a dispatch from Detroit, E. LeRoy Pelletier, one of the best known advertising men in the industry, has become connected with the Campbell-Ewald Advertising Agency in that city. It is understood that he will act as advertising counsel for several large accounts carried by this concern, among which is that of the new Maxwell Motor Company, Inc.

Information from New York states that Mr. Pelletier also is interested with John Splitdorf of that city in the organization of a company for the production of a new electric starter. This concern should not be confused with the Splitdorf Electrical Company, Newark, N. J., well known maker of ignition and electric lighting equipment.

PROVIDENCE SHOW SUCCESSFUL.

Second Annual Display Under A. S. Lee's Management Enjoys Satisfactory Business.

While it is impossible to give an estimate of the business done by the members of the Rhode Island Automobile Dealers' Association at the second annual show in the state armory, Providence, R. I., Jan. 25-Feb. 1, it is announced that the total number of sales far exceeded those of the previous year. This is particularly gratifying to the association and to the manager, A. S. Lee.

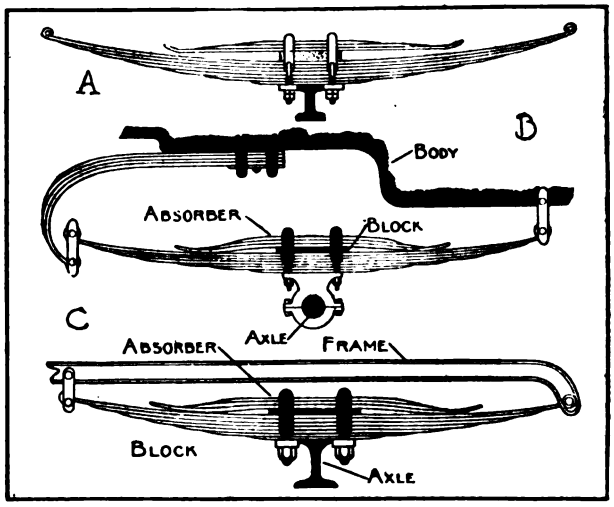
A. S. Lee, Providence Show Manager.

More than 20,000 persons attended the exhibit during the week, and this in spite of the fact that the price of admission was increased this year. It is the opinion of the management that this action resulted in the presence of a greater percentage of people who were actually interested in the new models and desired to make purchases.

An accompanying illustration presents Manager Lee, who is already engaged in considering plans for the 1914 show. An effort will be made to secure accommodations for all dealers who make application, but just how this is to be brought about is a problem which Mr. Lee is unable to solve at present. Much of the success of the two shows already held has been due to his energetic work, and there is little doubt that he will evolve a satisfactory plan for future displays.

AMES SHOCK ABSORBER.

A Device for Eliminating Vibration and Stresses Which Presents Interesting Features.



The springs of a car straighten when deflected by any unevenness in the road surface, and the resulting recoil projects the load of the machine upward and past its normal position, with a force proportional to the first shock. It is this movement which lifts one off the seat and which breaks the springs.

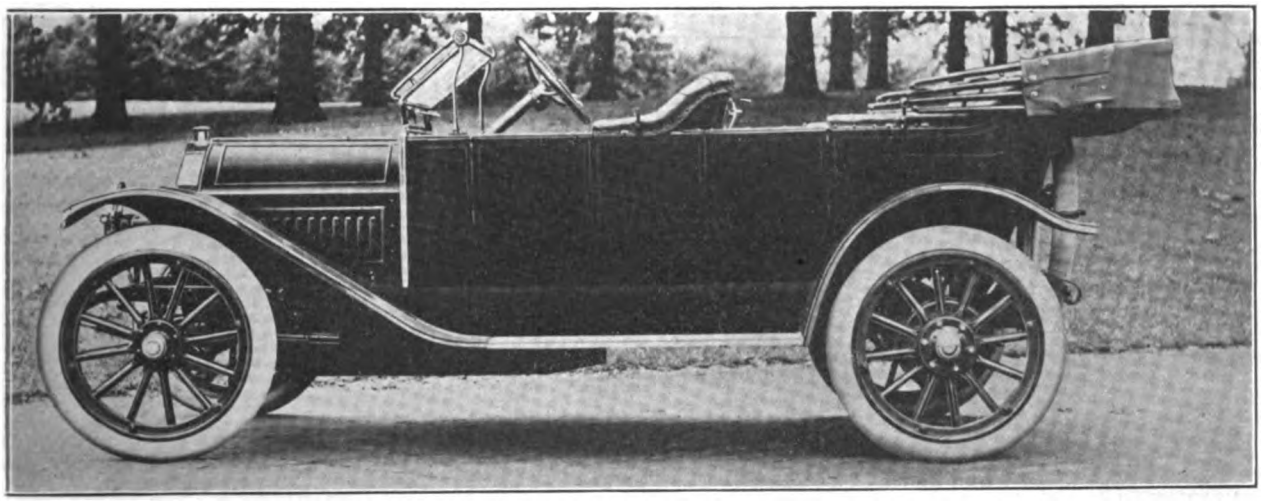
The Ames automatic shock absorber differs from those of conventional practise and comprises a steel spacing block and an inverted steel spring which is applied directly on top of the lower regular member. It has no effect upon the resiliency of the last named, nor is it affected by the first shock as the Ames is curved in the opposite direction. It is in contact with the spring in the latter's normal condition, but disengages when the spring is deflected as shown at A in the accompanying illustration. When the recoil takes place the shock absorber re-engages and so restricts the upward movement that all shocks and stresses are absorbed.

Another quality claimed for the Ames is that the master leaf is relieved of those stresses which make for breakage and that all vibration is absorbed by stopping them at the place at which they originate. The device is constructed both for pleasure and commercial vehicles and is made of heat treated, chrome vanadium spring steel.

The design makes for easy installation as the operation requires but the removal of the spring clips, fitting the block member, and replacing the clips. Longer clips are necessary, however, but these are supplied with the device by the licensees, Clarence N. Peacock & Co., 1784 Broadway, New York City.

The employment managers of many of the big Detroit automobile manufacturing concerns report difficulty in securing skilled mechanics to keep pace with the enormous increase in the production of their shops. The output of most of the factories has increased to such proportions that it is difficult to secure workmen to fill the neces-

The Ames Automatic Shock Absorber; A, Showing Position with Spring Deflected; B, Installation upon Rear Springs; C, on Front.



sary positions created by enlarged plants. However, overtime work is accomplishing much and the firms are meeting the demands for their machines with considerable success.

REFINEMENTS MARK NEW SCHACHT CHASSIS.

ANNOUNCEMENT is made of a new model chassis by the Schacht Motor Car Company, Cincinnati, O., maker of pleasure and commercial vehicles, to which is fitted three types of bodies, a two-passenger roadster, a five and an eight-passenger touring car, these being known as models K. L., N. S. and P. P. respectively. The last named differs slightly from the other designs in that the wheelbase is longer, larger tires are fitted and those components caring for the stresses created by extra passengers are proportionately strengthened.

The determination to concentrate its efforts upon one chassis is the result of 12 years' experience in the automobile industry and the company maintains that by the manufacture of one model each part is made better and more uniform, and that it permits of a decreased cost in production and price to the purchaser. While no radical departure from the Schacht product is noted, minor mechanical improvements have been made and the design incorporates principles indorsed by sound engineering practise. The new car is fully equipped, including electric lighting and motor starter, and every means for comfort and convenience.

Schacht Five-Passenger Touring Car, Having Attractive Body Lines and Complete Equipment, Including Electric Lighting and Motor Starter.

Improved Power Plant.

The power plant has been improved with the idea of producing a very flexible motor, permitting of slow speed on the high gear with sufficient energy and having ample horsepower production to meet the approval of those who desire a serviceable and practical car, easily maintained at a minimum of expense. The motor is of the en bloc, L head type, having a 4.25-inch bore and 5.5-inch stroke which places it in the long stroke class. According to the S. A. E. formula it is rated at 28.9 horsepower, but a production of 45 is claimed by the company at 1625 revolutions a minute, which statement is substantiated by the piston displacement of 312 cubic inches.

The cylinder material is a special grade of gray iron and the water jackets are cast integral. That space above the cylinder heads usually subjected to the greatest heat of combustion is especially large, making for efficient cooling under all conditions of service. The walls of the cylinders are cast thicker than in conventional practise, a construction permitting of reboring with safety in the event of scoring, etc. The cylinders are offset from the crankshaft about .1875-inch, reducing side thrusts against the walls to a minimum. The unit is machined and ground accurately, the limit being very fine. The cylinders are finished in flat black.

Four Piston Rings Employed.

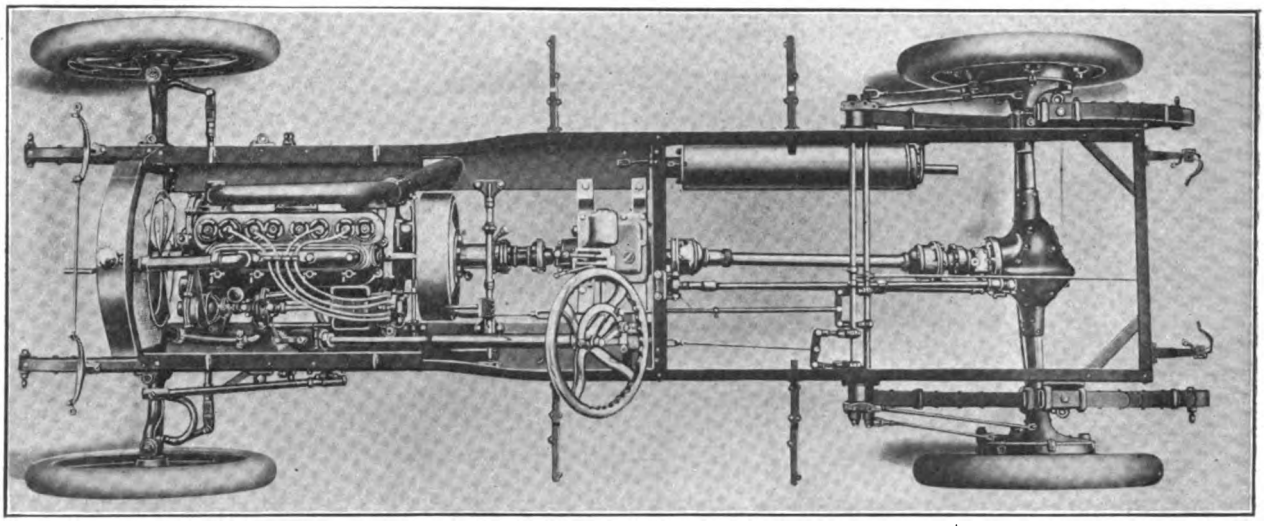
The pistons are a special gray iron and like the cylinder are ground to a perfect fit with a glass like finish. Four eccentric rings, .25-inch wide, are fitted to each above the wristpin, and extreme care is taken in securing a proper seat, a quality making for perfect compression and a well balanced motor. The web connecting rods are constructed of a special carbon, drop forged steel, 11.875 inches long, and the crankpin bearing

Digitized by Google

is a split member secured by four nickel steel studs and retained by large castellated nuts and cotter pins. The rods are held in the pistons with case hardened tubular wristpins 1.0625 inches in diameter, and these oscillate in heavy phosphor bronze bearings, retained by set screws in piston bosses.

Three-Bearing Crankshaft.

The crankshaft is a drop forging of a special carbon steel, two inches in diameter in the centre, and rotates in three split bearings of Parsons' white brass. The dimensions of the bearings are as follows: Forward, 3.125 inches long, 1.75 inches diameter; centre, 2.5 long, two diameter; rear, 4.125 long, 2.125 diameter. The ample size of crankshaft and bearings makes for sturdiness and perfect alignment. The camshaft is forged with the cams integral, of special carbon steel, and rotates in three phosphor bronze bearings, one inch in diameter. The cams have a lift of .3125 inch.



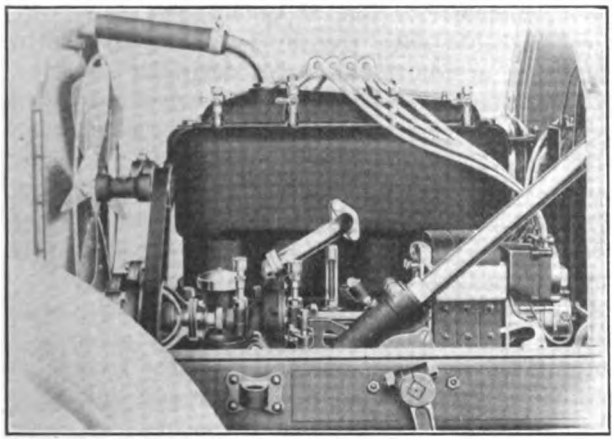
Large Sized Valves.

The valves are located on the right side of the motor and are housed by two pressed steel covers, excluding foreign elements, and the enclosing of the valve mechanism not only makes for durability but silent operation. The valves measure 1.857 inches in diameter, have case hardened heads electrically welded to high carbon nickel steel stems. The pushrods are .625 inch in diameter, having case hardened and ground steel rollers operating on hardened steel pins, and move through guides having 2.75-inch bearing surfaces. All valves are interchangeable and adjustable by means of an adjusting nut and lock washer arrangement on the heads of the pushrods. They are easily removed when grinding is necessary. Petcocks are provided.

The cylinders are bolted and lock washered to the upper crankcase, which is a two-piece construction of an alloy aluminum. The lower section may be dropped easily when adjustment of bearings, etc., is desired. Both the intake and exhaust manifolds are cast separately from the cylinders and the latter member has an upward swing, making for accessibility to the valve mechanism. The exhaust manifold is secured by six easily removed lock washered steel bolts, and back pressure is reduced to a minimum by its ample size and large muffler. The intake manifold is well designed and should make for easy starting in cold weather.

The carburetor is a model L, 1.25-inch hot air jacketed Schebler and the feed of fuel is by gravity, a 15-gallon tank being fitted under the seat in the touring bodies and a 25-gallon container on the rear of the roadster. Ignition is by a Westinghouse combined generator and magneto, driven through the pump shaft. One set of spark plugs, located over the intake valves, is employed. Dual ignition is provided by the Westinghouse system, the storage battery being employed as an independent source of supply, the interrupter, coil and distributor being utilized. An automatic spark advance is a feature, the time of spark being retarded mechanically, thereby preventing injury to the operator in cranking with the control lever advanced. Provision is made, however, for manual operation.

The designer of the Schacht motor has paid



Plan View of Schacht Chassis to Which Are Fitted Three Types of Bodies, These Including Five and Eight-Passenger Touring Cars and Roadster.

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

special attention to the matter of lubrication and the system utilized is self-contained inside the crankcase. A plunger pump is actuated by the

Showing Water Pump, Manifolds and Accessible Oil Filler and Indicating Gauge.

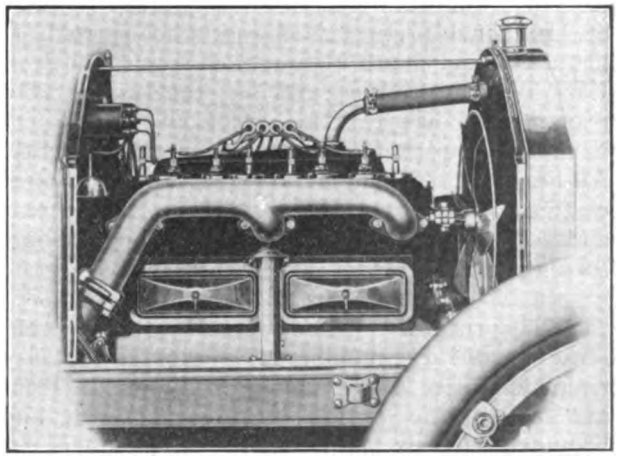
camshaft, forcing the oil to all bearings and timing gears. The surplus flows back to the sump, whence it is filtered and used over and over again.

A constant level of oil is maintained in the crankcase and the end of each connecting rod is provided with a scoop which dips into the lubricant, splashing it to all working parts. All oil is supplied through a large sized filler member, easily accessible, and a sight gauge next to the filler cap denotes the level of lubricant at all times. The oil reservoir has a capacity of 1.75 gallons.

Cooling.

A genuine cellular honeycomb radiator of 3.5 gallons capacity is employed and the cooled fluid is taken by a large centrifugal shaft driven pump and forced through a short intake pipe into the water jacket directly beneath the exhaust valves. After circulating around the cylinders the water passes out through a very short outlet pipe to the radiator. The top water manifold is of ample size and may be removed easily, making it a simple matter to clean the water spaces. Cooling is further aided by an 18-inch ball bearing fan having six blades, which is adjustable.

The clutch is of the cone type, Raybestos faced, and easy engagement is emphasized with the design. It is engaged by means of a heavy spiral spring contained in the rear end, and back thrusts are cared for by a large ball thrust bearing in front of the universal joint, coupled to the forward end of the main transmission shaft. Release of the clutch is brought about by a yoke operating on a shifting collar.



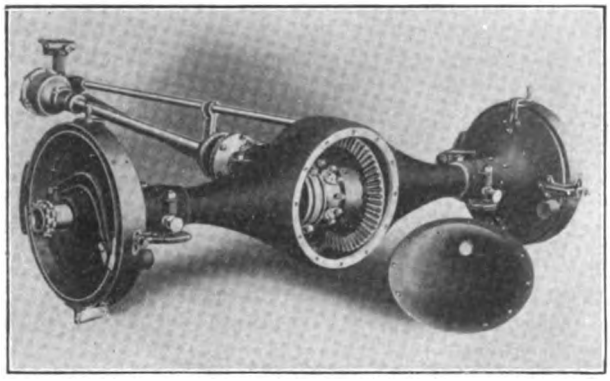
Selective Transmission.

The transmission is of the selective type, providing three speeds forward and reverse, and the ample sized gears are of chrome nickel steel. It is located amidships and the quadrant carrying the operating lever and emergency brake member is mounted thereon, eliminating lengthy shifting rods, etc. The shafts are of a high grade nickel steel and rotate in annular ball bearings. The housing is a special alloy aluminum and lightness and toughness is emphasized with the design and material employed. The gears rotate in soft grease and noiseless operation is claimed, as well as ease in the changing of speeds.

Drive is by a shaft of ample size and a high grade nickel steel is employed. The line is almost straight and drive is from a universal joint at the rear of the transmission to a similar member in front of the rear axle. The rear axle is of full floating type and the housing of pressed steel. The bevel pinion gear rotates in large ball bearings while high duty roller bearings are utilized for the differential.

Accessibility of Rear Axle.

Accessibility is a feature of the Schacht rear system and the removable cover plate of the differential housing permits of inspection or adjustment, while the 1.375-inch steel drive shafts may be taken out easily. They are secured to the wheels by a flange and six nickel steel bolts, lock washered. Double torsion rods are utilized, these running from the upper and lower sections of the differential housing to a ball and socket device having a heavy compensating spring attached to



Exhaust Side of Schacht Motor, Presenting Compact Construction and High-Tension Wire Clip.

the cross member of the frame. This construction eliminates all stresses and strains from the transmission and driving shaft.

Digitized by Google

The brakes are exceptionally large, being 14 inches in diameter and 2.5 wide. They are located on the rear wheels, the service members

The Rear Axle Is of the Full Floating Type and All Parts Are Readily Accessible for Inspection.

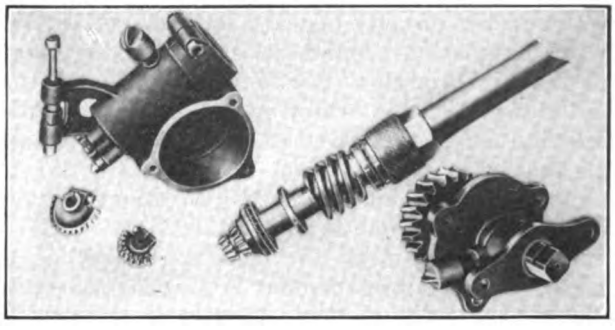
being of the external contracting type actuated by pedal, while the emergency are internal expanding, controlled by the conventional lever. They operate on a pressed steel drum held securely by heavy steel bolts to the spokes. Thermoid is utilized as a lining and over 350 inches of braking surface are provided. Both sets are equipped with equalizers, securing proper tension, and the contracting bands are prevented from rattling by spring adjusting nuts.

The front axle is of the I beam section type of drop forged carbon steel, 2.625 inches deep and 1.5 wide, with spring seats integral. The knuckles and steering linkage are ample in size, assuring a large factor of safety. Ball bearings hubs are fitted to the front wheels.

The frame of the Schacht is sturdy, is made of .15625-inch pressed steel and is hot riveted. It has a channel depth of four inches and width of 1.5. The sub-frame carrying the motor and transmission has a 3.5-inch drop and all corners have large gusset plates which make for rigidity. All brackets and hangers are drop forged or steel castings. The frame has a kick-up at the rear and is narrowed in front, making for a short turning radius.

Resilient Springs.

The springs are well designed and to the construction of these members is attributed the easy riding qualities of the machine. Those in front are semi-elliptic, 36 inches long, two wide and provided with six leaves. The rear members are three-quarter elliptic, 46 inches long, two wide and have seven leaves. All clips and shackles are drop forged with bolts double lock washered.



The wheels are of the artillery type, 12 spokes 1.5 inches diameter, and carefully selected second growth hickory is employed. They are fitted with demountable rims with one extra member, and 36 by four-inch tires are standard equipment on all models excepting the P. P., which has 35 by 4.5-inch tires. The 37 by 4.5-inch shoe is interchangeable with the 36 by four-inch and is furnished at additional cost if desired.

The steering gear is of the worm and gear type and the gear is irreversible. The connecting arm and tierod are ample in size. The steering column is set at 41.5 degrees, a comfortable angle, and is securely braced at the footboard and reinforced by special two-inch heavy nickel tubing, preventing vibration or rattling. The wheel is laminated and corrugated, 18 inches in diameter, and the gas and spark control levers are mounted on a sector on the top of the wheel. A feature of the steering mechanism and linkage is that all parts are adjustable for wear.

Left Hand Steer.

The driver is placed at the left with control levers in the centre at the right. The clutch pedal is at the left and brake at right and the usual accelerator and cut-out are standard equipment. The wheelbase of the roadster and five-passenger touring car is 120 inches and that of the larger machine, 128. Tread is standard, 56 inches.

All models are equipped with the Westinghouse electric lighting and motor starting system. The control of the starter is unique and conveniently located. It comprises a lever or handle mounted under the steering wheel at the rear of the column and a simple movement cuts in the current and rotates the flywheel of the engine until it operates under its own power. The starting motor is of the series wound type having four poles and is connected through a gearing to teeth cut on the periphery of the flywheel. The driving

The Steering Gear and Linkage Are Well Designed and Components Are Adjustable.

gear is automatically returned to normal by releasing the starting lever.

The battery is an LBA six-volt member of

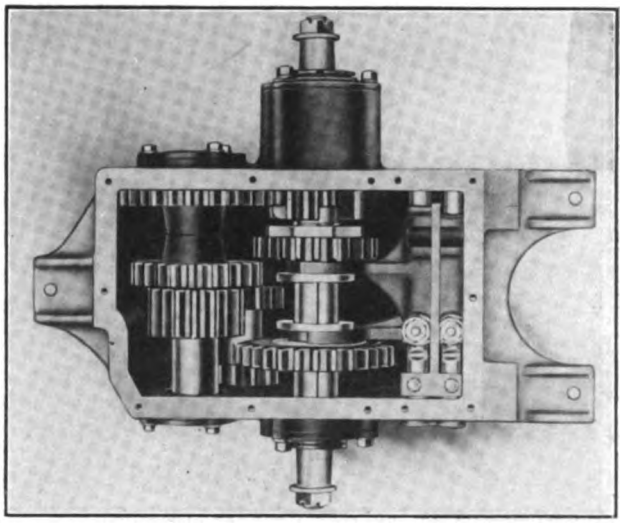
Digitized by Google

ample amperage capacity. One of the interesting features of the control of the lights and horn is the switch member. It is unusually neat and compact, comprising a small highly polished aluminum box or panel mounted on the steering column under the wheel. The arrangement not only makes for convenience, but for a clean appearing dash as well.

Attractive Bodies.

An attractive line of bodies is fitted to the chassis and they are noticeable for their straight line design from radiator to the rear. They are of special sheet metal, securely braced, and are sturdily constructed throughout. A quality of the design is that ample room is provided both in front and rear. The tufted Turkish upholstery is deep and comprises a high grade genuine buff leather with finest hair filling over resilient springs. The seats have exceptionally high backs and the cushions are 12 inches deep, making for comfortable riding qualities.

The doors are large, having the locks placed inside and are opened easily from the outside. Both front and rear fenders are well designed and harmonize with the graceful lines of the body. They are securely fastened to the frame and body and the splash apron extending from the running board to the frame is of the convex pattern and fully protects the occupants of the car from water and mud. The running boards are neatly covered with linoleum. The bodies and running gear are highly finished in standard deep blue black, but other colors are furnished at additional cost. The old fashioned lead and oil system is utilized and the company points out that the paint and varnish are very durable, 24 coats being employed.



The equipment is very complete, including imported English silk mohair top with side curtains and slip cover, speedometer, folding zigzag windshield, patent adjustable aluminum ventilator in windshield base, electric horn, cocoa tonneau mat, foot rest, tire irons, robe rail, one extra demountable rim, pump, jack, tools, etc. A large tool box is placed at the rear of all models and a trunk in addition on the deck of the roadster. All metal parts are silver nickeled.

Throughout attention has been paid to small details making for convenience and comfort as well as economical upkeep. Accessibility to all parts requiring lubrication and attention is noticeable and by removing the floorboard the clutch, transmission and universal joints may be reached easily. Ample provision is made for the renewal of lubricants, the transmission and differential having large filler members, while all parts subject to friction are fitted with grease cups. The power plant is protected by a well designed and substantial pan which may be displaced easily and quickly by eight spring levers.

DETROITER CARS ABROAD.

Foreign Business Equalizes Production When American Demand Is Highest.

The Briggs-Detroiter Company, Detroit, producer of Detroiter cars, made a large foreign shipment of cars this year, some of which were shown at the Olympic show in London at the Paris salon, France, and in Turin, Italy. The Briggs-Detroiter Company is now in its second year and during that time every foreign field

The Transmission of the Schacht Is Sturdy, Having Large Gears and Shafts.

where automobiles are sold has been closed by contract.

The effect of this foreign business has been to equalize the output of the factory, since the foreign demand is heavy during the season when the American business is lightest. Within the last two years the company has sent large consignments to Sweden, Australia, New Zealand, South Africa, Japan and Dutch West Indies.

The Automobile Club of Cincinnati, O., is planning for a membership campaign, the aim being to have 2000 active names on its roll by Thanksgiving Day, at which time the club expects to hold open house in the splendidly equipped new home in the Gibson house.

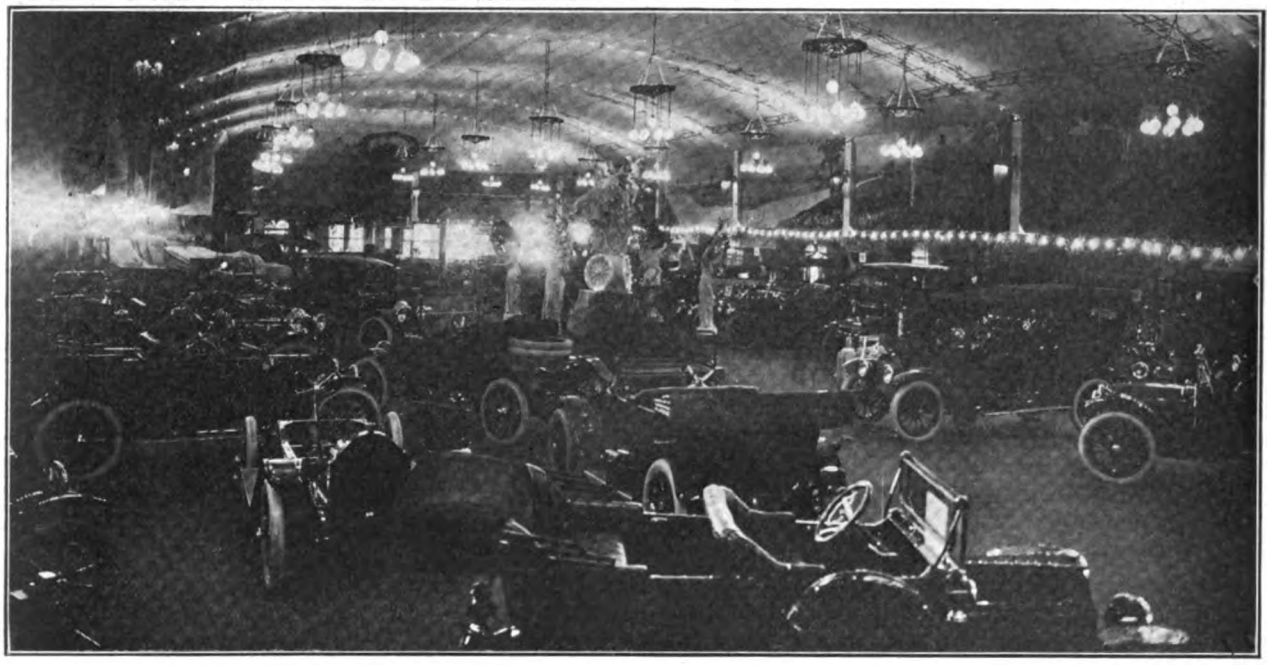
SPLENDID BUSINESS AT LOCAL SHOWS.



Demand for More Room Marks Displays in All the Leading Centres---Large Attendance and Many Sales the Rule---Detroit Dealers in Wayne Gardens.

DETROIT automobile dealers, who are responsible for the annual automobile show which opened at Wayne Gardens, Jan. 20, for one week, are to be congratulated on having overcome all obstacles encountered in giving an exhibition of such magnitude. Detroit, as the centre of the automobile industry, which employs tens of thousands of men, was justly proud of its show, national in scope and reflecting the prosperity of the city.

Thousands of people visited the Wayne Gardens during the opening night and the attendance throughout the week did not diminish from the mark set at that time. Summarized, there were 66 exhibits and 60 makes of cars, the total value of the display being about $1,000,000. It became apparent that the annual local show has grown to such proportions since the first one was held 12 years ago that next year the Wayne Annex, built especially for exhibitors, will have to be two stories high instead of one. Although ample space was afforded to exhibitors, a second floor could have been disposed of by the space committee this year had it been available.

From a business standpoint, the result was particularly gratifying. Many sales were recorded. In still another manner the show was unique, in that at least one new car was added to the list coming from Detroit. This was a Traveler-Detroit, made by the Traveler Motor Car Company and displayed in coupe, touring and roadster models.

The decorations were on a more elaborate scale than ever before and the show was given a most beautiful setting. The manager was Walter Wilmot and the officers of the Detroit Automobile Dealers' Association, which had charge of the event, are: President, W. F. V. Neumann; treasurer, C. C. Starkweather; secretary, Joseph A. Schulte; directors, Paul R. McKenney and Frank M. Seland. Following is the list of exhibitors:

Interior View of the Wayne Gardens, Detroit, Indicating Decorative Treatment and Lighting Effects During Recent Automobile Show.

Pleasure Cars—Abbott Motor Company, Abbott-Detroit; Annett Auto Garage, Auburn; Artemas Ward, King; Baker Electric Company, Baker electric; Barber Motor Sales Company, Detroiter; Bemb-Robinson Company, Hudson; Buick Motor Company, Buick; Cadillac Motor Car Company, Cadillac; Cartercar Company, Cartercar; Century Electric Sales Company, Century electric; Chevrolet-Little Company, Little, Chevrolet; Church-Field Company, Church-Field electric; Cunningham Auto Com-

pany, Flanders, Maxwell; Detroit Electric Garage, Detroit electric; Detroit Hupmobile Sales Company, Hupmobile; Ford Motor Company, Ford; Foster Motor Sales Company, Cutting; Havers Motor Car Company, Havers; Grant Bros. Auto Company, Lozier; Grinnell Electric Car Company, Grinnell electric; J. P. Schneider, Stevens-Duryea, Locomobile; Keeton Motor Company, Keeton; Krit Motor Car Company, K-R-I-T; M. A. Young, Reo, Mitchell; Neumann-Lane Company, Chalmers, Pierce-Arrow, Rauch & Lang electric; Oakland Motor Car Company, Oakland; Olds Motor Car Company, Oldsmobile; Overland Motor Sales Company, Overland; Postal-Fair Motor Company, Peerless, Michigan; P. W. Schulte & Sons, Paterson; R-C-H Corporation, R-C-H, Hupp-Yeats electric; Regal Motor Sales Company, Regal; Seidler Sales Company, Jackson; Siegel-Zeckendorf Company, Cole; Standard Auto Company, Packard; Studebaker Corporation, Studebaker; Traveler Motor Car Company, Traveler-Detroit; Warren Motor Car Company, Warren; W. J. Marshall Auto Company, Paige; Winton Motor Car Company, Winton.

Commercial Vehicles—Cleveland-Galion Motor Truck Company, Cleveland-Galion; General Motors Truck Company, G. M. C. gasoline and electric; M. A. Young, Reo; Standard Auto Company, Packard; Thompson Auto Company, Federal, Standard, Alco.

Members of Lynn Automobile Dealers' Association in Charge of Recent Show: President Harry Doane in Centre, Secretary-Treasurer Percy I. Reynolds at Right, S. P. Tierney at Left.

Accessories—Chas. E. Miller, Boyer Miller Company, Buhl Sons Company, Detroit Auto Equipment Company, Edward G. Budd Manufacturing Company, Esco Auto-Lock Sales Company, Garrison Gasoline Engine Specialties Company, Indian Refining Company, Murphy Power Company, Punctureless Tire Company, Sears-Cross Company, Sewell Cushion Wheel Company, Armitage Leather Company, Automobile Equipment Company, Cleveland Hardware Company, National Refining Company, Paragon Refining Company, Vanguard Manufacturing Company, Wayne Oil Tank & Pump Company, Weston Electric Instrument Company, William Shakespeare, Jr., Company.

MANY SALES IN LYNN.

Results Such as to Justify Continuance of Policy Adopted Annually by Dealers.

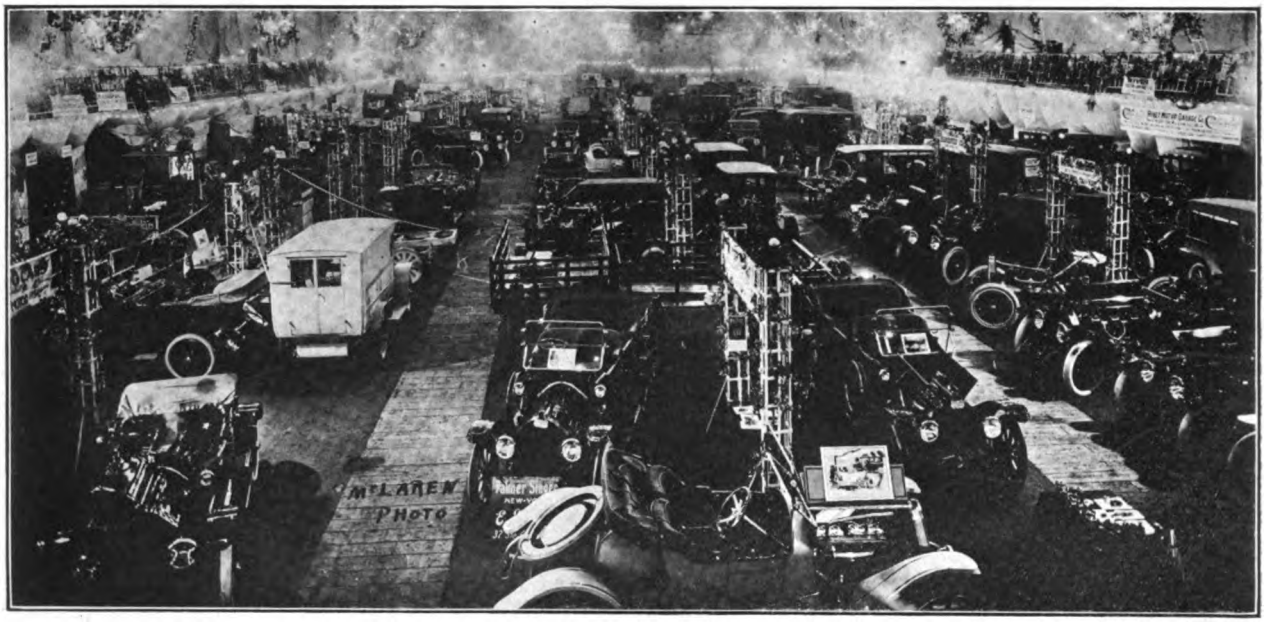
The annual show of the Lynn Automobile Dealers' Association proved the most successful in the history of the organization, and the state armory in Lynn, Mass., was visited daily by a large number of people from Lynn, Swampscott, Nahant, Saugus and other nearby places during the week of Jan. 20-25. A special musical programme was given each day and the arrangements for the comfort of those who desired to inspect the new models were pronounced perfect.

Although Lynn is within easy access of Boston and the biggest exhibition of the entire year, the local dealers always have held their display in advance of that event. The idea has been to stimulate business and close sales as early in the season as possible, and reports from this year's show would seem to indicate that the business transacted was such as to warrant a continuance of this policy.

The following were the committees in charge of the show: General, W. H. Bennett, W. H. Beede, S. P. Tierney; publicity and advertising, W. H. Bennett, H. M. Doane, S. G. Warner; music, decorating and lighting, W. H. Beede, P. I. Reynolds, S. H. Barrett; programme, S. P. Tierney, F. Plumstead, C. R. Sibley, C. F. Green, F. I. Mitchell. The exhibitors and their products follow:

Pleasure Cars—S. G. Warner, Paige; M. Plumstead & Son, Maxwell, Stoddard-Dayton, Columbus electric; Fred Mitchell, Stevens-Duryea; Liberty Garage, Hudson, Studebaker; Essex Auto Company, Peerless, Flanders, American, Hupmobile; E. H. Beede, Ford; S. P. Tierney, Buick; Seymour Avenue Garage, Mitchell, Detroiter; Michigan Motor Company, Michigan; E. T. Reynolds, Pope-Hartford; P. I. Reynolds, Oakland.

Commercial Vehicles—Liberty Garage, White, Chase; Essex Auto Company, Peerless, Hercules.



Accessories—Lynn Auto Company, tires and supplies; Lynn Sporting Goods Company, general accessories, motorcycles and bicycles; P. I. Reynolds, supplies.

MONTREAL HOLDS ANOTHER SHOW.

Dealers Attract Second Large Crowd and Demonstrate Local Interest in Cars.

The fact that Montreal, Can., was able to support two large shows in one season, the second following the first by only one week, is abundant evidence of the growth of the automobile industry in that section. The first display was held by Canadian manufacturers and representatives of American producers, Jan. 11-18. The second was under the auspices of the local dealers, in the Drill hall, Jan. 25-Feb. 1. It is estimated that more than $75,000 in business was closed at the second display for the year in that city.

Main Floor of the Drill Hall, Montreal, Showing Wide Diversity of Pleasure and Commercial Vehicles Displayed by Dealers.

Seven years ago the first motor car exhibition was held in Montreal in the Arena, a much smaller building, and the number of exhibitors was so small that it became necessary to invite displays from makers of lines wholly foreign to the industry. When the automobile was first introduced in that territory, weather and road conditions were such as to discourage the most venturesome. Improvements in mechanical construction on the one hand and interest in better highways on the other have united in making the present day car a practical institution. The interest in it was manifested by the large attendance at both displays this year.

The dealers' show was under the able management of R. M. Jaffray, and the decorations were on a scale never before attempted in Montreal. Large baskets daintily draped with beautiful colored flowers hung from the ceiling, which was concealed by light blue bunting. The side walls also were hidden from view, and at each exhibition space was a small arch prettily decorated with green creepers and flowers.

There were 124 pleasure cars and 51 trucks on display, besides motorcycles and accessories, and a large monoplane, built by a local constructor, was to be seen in one of the side rooms. An accompanying illustration shows the main floor, where the following exhibits of cars and trucks were made:

Automobile Francaises, Berlit; Canadian Pneumatic Tool Company, Ltd., Little Giant truck; J. O. Collette, Little, Chevrolet; Stockwell Motor Company, Lozier, Paige, Peerless, Maxwell, Standard electric; Bellerive Garage & Auto Company, Mitchell; Canadian Fairbanks-Morse Company, Ltd., Mack truck; Gareau Motor Car Company, Marmon, National, Tudhope, KisselKar; Paul Lair, Michigan, Juno truck; William J. O'Leary & Co., Maritime; Arthur Pelletier, Menard; De Vaux Motor Company, Nyberg; Norwalk Motor Car Company of Canada, Norwalk; Pope-Hartford Motor Company of Hartford, Overland, Pope-Hartford, White truck; E. Major, Palmer-Singer; S. Gagnon, Rambler, Cutting, Empire; Republic Motor Car Company of Toronto, Republic; La Cie. Laiterie St. Daurent, Standard truck; Royal Automobile Company, Cole, Stevens-Duryea; Frigon & Baker, Winton; Rivet Motor Garage Company, Rg'd., Watson, Cartercar, Avery truck; Montreal Locomotive Works, Ltd., Alco truck; Albion Motor Car Company, Ltd., Albion; Victor Levesque, Abbott-Detroit; A. Beaudry, American; Baker Motor Vehicle Company of Canada, Baker electric; Brantford Motor Truck, Ltd., Brantford truck; J. B. Baillargeon Express, Commer truck; Rousseau Bros., Ltd., Cadillac; Drednot Motor Trucks Works, Ltd., Drednot truck; Canadian P. J. Mitchell Company, Ltd., Garrett; R. E. T. Pringle, G. E. V.; Motor Transport, Ltd., G. M. C.; Fred E. Ritchie,

Henderson; International Harvester Company of America, International; P. A. D. Robert, Jackson; Arlington Bicycle Works, Indian motorcycles.

PHILDELPHIA'S TRUCK DISPLAY.

Second Week of Dealers' Exhibition Meets with Decided Favor from Business Men.

Following the close of the pleasure car show in the Automobile Club building at Philadelphia, under the auspices of the local dealers, the commercial vehicle display was opened Monday, Jan. 27, in the same building. The character of the exhibits had been entirely changed and instead of the highly polished touring cars which had delighted over 35,000 persons during the first week, were to be found a remarkable list of motor trucks of all kinds, ranging from small delivery wagons to vehicles of large carrying capacity. There were over 30 makes of trucks, gasoline and electric, on the first and second floors, in addition to the large representation of accessory dealers.

The attendance at the truck show also was of an entirely different character from that seen at the pleasure exhibition. A steady stream of business men and others interested in the mechanical transport inspected the various models, seriously bent on learning all they could about haulage costs and the suitability of the different makes for their individual requirements. Some 80 different types were shown by the following:

Devon Truck Company, Devon; Eldredge Company, Garford; H. C. H. Motors Company, Lauth-Juergens; General Motor Truck Company, G. M. C. gasoline and electric; International Motor Truck Company, Mack, Saurer, Hewitt; J. C. Bartlett, Mais, Walker electric, Detroit electric, Automatic electric factory truck; Packard Motor Car Company, Packard; Foss-Hughes Company, Pierce-Arrow; Eastman Motor Truck Company, Wilcox; Kelly-Springfield Motor Truck Company, Kelly-Springfield; White Company, White; Autocar Company, Autocar; C. A. Haines & Co., Baker electric; Chase Motor Truck Company, Chase; Commercial Truck Company, Commercial electric; General Vehicle Company, G. V. electric; International Harvester Company, International; Kissel Motor Company, KisselKar; Lansden-Webb Company, Lansden electric, Webb fire apparatus; Locomobile Company of America, Locomobile; Gomery-Schwartz Motor Company, Stewart; Cartercar Motor Car Company, Commerce; Gramm Motor Truck Company, Gramm; Longstreth Motor Car Company, Alco.

FOURTH ANNUAL TOLEDO SHOW.

Nearly Double the Number of Exhibitors Seen at Any Previous Display.

The Toledo Auto Shows Company has just closed what was pronounced to be the most successful automobile exhibition ever held in Toledo, O., in the Terminal building. It was the fourth annual event and nearly double the number of exhibitors displayed cars than was the case a year ago. In all there were 52 makes shown by 29 dealers.

The decorations were excellent, the rooms being transformed into a southern garden. The aisles were carpeted in green to resemble grass, while the booths were bounded by foliage, palms in profusion marking the aisles. Green and white and blue and white draperies covered the ceilings and the walls were concealed by paintings to heighten the garden effect. Following are the exhibitors of vehicles:

Pleasure Cars—Abbott Motor Sales Company, Abbott-Detroit; H. J. Adams, Reo; Atwood Automobile Company, Overland, Marmon, Standard electric; Auglaize Motor Car Company, Auglaize; Auto Exchange Company, Regal; Baumgardner & Kibby, Oakland, Columbus electric; Bunnell Auto Sales Company, Cole, Little; Clyde Auto Sales Company, Detroiter, Nyberg; Cornelius-Hohly Auto Company, Imperial; Dennis Motor Car Company, Rambler, Detroit electric; Ford Bros. Auto Sales Company, Michigan, K-R-I-T; Gamble Motor Car Company, Peerless, Garford, Ohio, Baker electric; Gauntlett Auto Sales Company, Buick; Grasser Motor Company, Hupmobile; M. E. Humbarger, Apperson; E. W. K. Burg, Stearns-Knight, R-C-H, Hupp-Yeats electric; Landman-Griffith-McIntyre Motor Company, Flanders, Stoddard-Dayton, Flanders electric; Litchie Automobile Company, Cadillac; Maumee Motor Car Company, Empire, King; Roberts-Toledo Auto Company, Ford; Standard Auto Company, Packard, Imperial, Rauch & Lang electric; H. E. Thorne, Mitchell, Paige; Toledo Motor Sales Company, Hudson; Union Supply Company, Pierce-Arrow, Chalmers; White Motor Car Company, White.

Commercial Vehicles—Banting Machine Company, Paterson, Krebs; Blovins Auto Sales Company, Sandusky; Dennis Motor Car Company, Alco; Gamble Motor Car Company, Peerless, Garford; Gauntlett Auto Sales Company, G. M. C.; Moore Motor Truck Company, Moore; Standard Auto Company, Packard; Union Supply Company, Pierce-Arrow; White Motor Car Company, White.

PLEASURE CARS AT BUFFALO.

Machines Valued at $2,500,000 Shown at Eleventh Annual Dealers' Display.

The 11th annual pleasure car show of the Buffalo Automobile Dealers' Association at the Broadway Auditorium, Buffalo, N. Y., was the largest display ever held in that city and it is estimated that the value of the product of the many manufacturers in the hall was about $2,500,000. A splendid decorative and illumination scheme was carried out, the central feature being the use of green and gold streamers extending from the middle of the ceiling to the eaves of the building and 30,000 square feet of green cloth covering the floor.

At the entrance to the hall was a long fence literally covered with flowers. In the centre was a fountain, representing a lion's head, while at the southern end of the structure was an Italian fountain 20 feet in diameter, illuminated by electric lights of variegated colors. The aisles were

Digitized by Google

so arranged that no difficulty was experienced by the crowds in passing about the hall. Following is the complete list of exhibitors and their cars:

Co-operative Motor Car Company, Stevens-Duryea, Abbott-Detroit; Ralph E. Brown Motor Car Company, American, Winton, Rauch & Lang electric; Barrett Motor Car Company, Paige, Apperson; Buffalo Motor Vehicle Service Company, Baker electric; Buffalo Electric Vehicle Company, Buffalo electric; Buick Motor Company, Buick; Kane Motor Supply Company, Cadillac; Louis Engel, Jr., Cartercar; Mason B. Hatch, Chalmers; Joseph Rath, Chevrolet, Little; Cole Motor Company of Buffalo, Cole; Monroe Motor Car Company, Columbia; C. W. Trautman, Detroit electric; Delaware Avenue Garage, Marmon, Detroiter; Automobile Sales Company, Pullman, Fiat; Werick Bros. Motor Car Company, Haynes, Firestone-Columbus; Excelsior Sales Company, Flanders electric; Meyer Motor Car Company, Reo, Flanders; Ford Motor Company, Ford; George Ostendorf, Franklin; Grinnell Electric Car Company, Grinnell electric; Zimmer Motor Vehicle Company, National, Imperial, Henderson; Buffalo-Hudson Sales Company, Hudson; Henry Brunn, Peerless, Hupmobile; L. G. Schoepflin Company, R-C-H, Hupp-Yeats electric; F. A. Ballou, Jackson; Buffalo KisselKar Company, KisselKar, Simplex; Krit Motor Car Company, K-R-I-T; Buffalo Motor Sales Company, Lion; R. G. Danahy Company, Lozier; Mutual Motor Car Company, Victor, Marathon; Harry L'Hommedieu, Marion; Matheson Automobile Sales Company, Matheson; Monroe Motor Car Company, Maxwell; Frontier Motor Car Company, McFarlan; J. J. Gibson Company, Mitchell; Miller-Schulman Motor Car Company, Moon; Centaur Motor Company, Oakland; Oldsmobile Company of Buffalo, Oldsmobile; Overland-Buffalo Company, Overland; Packard Motor Car Company of New York, Packard; Singer-Brighton Motor Company, Palmer-Singer; Pierce-Arrow Sales Company, Pierce-Arrow; Lutz Automobile Company, White, Premier; Regal Motor Sales Company, Regal; Mason B. Hatch, Stearns-Knight; J. A. Cramer, Stoddard-Dayton; A. W. Haile Motor Company, Studebaker; Dixon Motor Car Company, Velie.

WINNIPEG'S SECOND ANNUAL.

Feature of This Year's Display Is Special Models from America and Europe.

The second automobile show, under the direction of the Winnipeg Motor Trades Association, opened at Winnipeg, Can., Feb. 10, and while not as large as some of those held in the United States, it is nevertheless a representative exhibit of Canadian and American products calculated to please the motor enthusiast. Some special models are being shown that have occupied prominent places in other displays, a few of them coming from Europe. Among the exhibitors are the following:

Canadian Fairbanks-Morse Company, Plews Automobile Company, Tudhope Motor Car Company, J. Maw & Co., Ltd., Lions Garage, Cadillac Motor Sales Company, Canadian Motor Company, Ltd., J. I. Case Company, Michael Ert, Winnipeg Garage, R-C-H Motor Sales Company, Russell Motor Car Company, Breen Motor Company, Western Canada Motor Car Company, McLaughlin Carriage Company, S. F. Bowser & Co., Ford Motor Company, A. C. McRae, Goodyear Tire & Rubber Company, John Mullen & Son, P. C. Hagarty, Triple Tread, Dunlop Tire & Rubber Company.

LARGE DISPLAY AT TROY.

Splendid Decorative Scheme and Wide Representation of Dealers in City and Vicinity.

The annual automobile show at Troy, N. Y., which opened at the state armory Jan. 27 and continued throughout the week was on a scale of grandeur and brilliancy never before attempted by the Troy Automobile Dealers' Association, which had the event in charge. It was the third exhibition to be held in that city.

The exhibition represented a large sum, one display alone reaching $30,000. The decorative scheme offered by the management was the most extensive ever seen in the big armory, every corner of which was treated. Yellow and gold bunting, masses of green foliage, thousands of electric lights and numerous oriental idols, billikens and picturesque statues were utilized. The show was opened by Mayor Cornelius J. Burns, who, after a brief address on the growth of the industry, touched the button which turned on the electric illumination. The exhibition this year was more representative of the industry than ever before and the following is a list of exhibits:

Pleasure Cars—Troy Motor Company, Cadillac, Fiat; Troy Automobile Exchange, Pierce-Arrow; Bolton-Myers Auto & Truck Company, Haynes; Congress Auto Company of Cohoes, Nyberg; Scott D. Nichols, Ford, Reo, Premier; Vincent & DeBaum, Metz; Ilium Garage, R-C-H; Betts Auto Company, Oldsmobile; Harvey J. Beeker, Paterson; John J. Blackhall, Jr., Crow Elkhart, Moline; Close Bros. of Schenectady, Knox; Dominent Motor Company of Albany, Packard; Fred V. Clute of Cohoes, Pope-Hartford, Overland; George Snyder, Stearns-Knight, Buffalo electric; Cohoes Automobile Company, Stoddard-Dayton, Little; East Side Motor Car Company, Paige; Payne Automobile Company, Studebaker; Troy Motor Carriage Company, K-R-I-T, Mitchell, Speedwell; C. H. Abbott, Stanley steamer; Aird Motor Company, Stutz, Apperson, Marmon; Wilbur Auto Sales Company, Cole, KisselKar; Monument Square Garage, Locomobile, National, Rambler, Hupmobile; J. J. Aker, Regal.

Commercial Vehicles—Troy Automobile Exchange, Pierce-Arrow, Lippard-Stewart; Foster Piano Company, Selden; Close Bros. of Schenectady, Knox trucks and fire apparatus; Dominent Motor Company, Packard; Fred V. Clute, Cohoes, Pope-Hartford; Troy Motor Carriage Company, Speedwell, Kelly-Springfield; Aird Motor Company, Chase; Park Garage Company, Albany, KisselKar; Monument Square Garage, Locomobile; Wilbur Auto Sales Company, KisselKar.

Miscellaneous—Vincent & DeBaum, punctureless inner tubes; Edgar H. Brunelle, Indian motorcycles, sporting goods; Albany Motorcycle Company, Harley-Davidson motorcycles, Arden bicycles; Standard Oil Company, lubricating oils and greases; Post & Lester Company, Albany, accessories; Economy Baler Company, Ann Arbor, Mich., represented by Peerless Trading Company, Albany, steel fireproof waste balers; William S. Martin, Englebert tires; H. T. Silberman, New York City, confectionery; Troy Automobile Club, information bureau; Mohawk Welding Company, engine welding demonstration; Myers Bros., New York City, ivory novelties; John S. Jones, automobile insurance; Troy Spring Works, spring repairing; Colorado Gold Stone Company, jewelry; William H. Frear & Co., automobile clothing and necessities.

NEWARK PLANS COMPLETE.

Seventy Exhibitors Secure Space in First Regiment Armory for Annual Event.

The annual automobile show at Newark, N. J., will be held in the First Regiment armory the week of Feb. 15-22 and advance indications point to the probability that the commercial car section will be a strong rival to the main exhibit of pleasure vehicles. All the principal makes will be on display as will also several new types.

Space reservations were made freely and the closing date for these applications found a list of about 70 exhibitors of pleasure cars trucks and accessories. More than 200 cars, comprising 53 distinct makes, will be shown. The enthusiasm over the show, while evidenced largely among those who are actively engaged in the manufacture and sale of motor vehicles, is probably equalled by that of the automobile owners and the general public. The list of commit tees follows:

Space, George Paddock, C. Louis Fitzgerald, George Blakeslee, Walter H. Ellis, George H. Smith, R. A. Greene, Richard B. Mann; press, programme and advertising, H. A. Bonnell, Leonard B. Zusi, Jacob W. Mason; decorations, A. J. M. Edwards, Leonard B. Zusi, A. H. Humprieville; finance, R. A. Greene, Inglis M. Uppercu, Walter H. Ellis; entertainment, Joseph H. Wood, George Blakeslee, DeWitt C. Reynolds, D. B. Dunham, H. D. Ogden, F. A. Crosselmire, Richard T. Newton, Dr. James R. English, C. Louis Fitzgerald.

DEALERS UNITE AT ALBANY.

Schenectady, Cohoes and Troy to Be Represented as Well as the Local Men.

The Albany Automobile Dealers' Association, Albany, N. Y., is preparing for what is expected to be its most successful automobile show, to be held at the state armory Feb. 15-22. Dealers in Schenectady, Cohoes, Troy and neighboring places are uniting in this display and the detail plans have been worked so far in advance by Manager C. A. Simmons and the committee in charge that its success is assured.

A special feature will be made of the truck exhibit, which will be in the basement. The main floor will be devoted to an exhibition of pleasure cars. There was no show last year owing to inability to secure the armory, so that this year's event has met with general enthusiasm. The committee in charge includes J. B. Wood, W. J. Sutherland, C. F. Weber, J. S. Kingsbury, E. V. Stratton and W. R. Mason.

ROCHESTER'S BIGGEST SHOW.

Three Buildings Utilized to Advantage by Dealers at Fifth Annual Exhibition.

With 80,000 square feet of floor space given over to the exhibition of some 50 different makes of pleasure vehicles, to say nothing of commercial cars representing 20 manufacturers, and a large number of accessories, the fifth annual automobile show in Rochester, N. Y., opened at Exposition Park, Jan. 27 and continued one week. The exhibitors, members of the Rochester Automobile Dealers' Association, occupied buildings three, four and five.

First Regiment Armory, Newark, N. J., Where Annual Show Will Be Held Feb. 15-22.

For the first time in the history of the association, truck and pleasure vehicles were shown in the same space. The visitor entered building No. 3 and was forced to pass the accessory booths in order to reach the display of vehicles, a plan that was particularly beneficial to these exhibitors. While there were no special designs in the decoration of the three buildings, they nevertheless presented an attractive appearance, one being in green and gold, another in blue and white and the third in the national colors.

No effort was spared to make the show the greatest ever held in Rochester and the officers of the association and the executive committee

Digitized by Google

were very well pleased with the result both in the matter of attendance and sales. Following are the officers and members of the executive committee: President, F. W. Peck; vice president, C. E. Hartson; treasurer, F. R. Leuscher; secretary, G. J. Bauer; executive committee, C. E. Hartson, H. P. Gould, A. V. Hart, A. M. Zimbrich, A. R. McKenney, C. E. Sager, H. G. Strong, Robert Thompson, Paul Le Hardy. A complete list of the exhibitors follows:

Almy Auto Company, Automobile Journal Publishing Company, George H. Barker, Babies' Health, Unlimited, Beers Bros., Thermostat Company, Benedict & Becker, Ball-Washburne Motor Company, D. E. Bemish, Clark Novelty Company, John Cunningham-Fordham Company, W. E. Davidson Electric Car Sales & Service Company, Empire State General Vehicle Company, A. Faber Company, E. W. Fisher, Franklin Automobile Company, Flynn Bros., A. H. Gable Company, Cibaud's Rochester Supply Company, Globe Manufacturing Company, C. E. Hartson, Frank P. Hunt, Indian Refining Company, Kemoshine Manufacturing Company, John Kimpson, Knipper-Kipp Company, W. H. Kline, J. A. Laurer, LeHardy & Lindsay, Edward J. Lucas, F. R. Leuscher, Inc., Kline Motor Car Company, Inc., Harry J. McKay, McKenney & Gilpin, Mabbett-Bettys Motor Car Company, Mandery Motor Car Company, New York Auto Tire & Supply Company, New York Telephone Company, Thomas J. Northway, Neff & Malone, Oliver Bros., Overland-Rochester Company, Pawlik & McGuiden, Peck & Arnold, F. Porschet, Rochester Ice Cream Company, Rochester Welding Works, Rochester Rubber Company, Edward Rabe, Rochester Railway & Light Company, Rochester Sporting Goods Company, W. H. Rowerdink & Son, Selleck Auto Equipment Company, Charles E. Sager, Shafer-Decker Company, F. C. Schutt, Sullivan Motor Car Company, Towner Bros., Wayne Oil Tank & Pump Company, E. Q. Williams, C. L. Whiting, Wagner-Dolph Company, Williams Heater Company, R. Walter White, J. Fred Webber, A. M. Zimbrich, Gillis-Baird Motor Company, Oldsmobile Company of Buffalo, Inc., Hazard Motor Manufacturing Company, Stein Auto Supply Company, John Leader & Son Company, James Cunningham, Son & Co., Atterbury Motor Car Company, Philadelphia Storage Battery Company, A. V. Hart, Arthur McNall, Abbott-Detroit Sales Company, Allen Street Oil Works, Rochester Telephone Company, D. L. McGuire & Bro., Union Oil Works, Vincent Orvis, Meyers Bros., Strong-Crittenden Company, Hollis-Rand Company, Michigan Motor Sales Company, A. Elliott, C. W. Henner, Louis Ernst & Sons, O-Tak-A Tire Remover Company, Robert Thompson, Genesee Motor Vehicle Company, Monroe County Oil Company, George L. Miner Company, Rochester Iron Works, Alling & Miles, Rochester Macanderuba Tire Filler Company, Shaw Bros., Selden Motor Vehicle Company, Leonard Glover, Thomas Watson, C. E. & H. B. Clark, Cutting Auto Sales Company, G. E. Lytle, C. M. Walker.

NEW MAKES AT PITTSBURG.

Many Producers Will Display Lines Never Seen in That City.

The Exposition hall automobile show to be held at Pittsburg, Penn., March 1-8, will eclipse all previous exhibitions, as the demands for space have been so heavy that the show management is considering the possibility of securing Machinery hall in addition. Many manufacturers are taking space with the idea of securing agencies for the Pittsburg district and are to show cars never seen before in that city.

The Automobile Dealers' Association has charge of the event and 40 dealers are working hard for its success. It is stated that about $40,000 will be used to finance the exhibit, which will include machinery, tools and accessories in addition to commercial and pleasure vehicles. The decorations will consist of mural paintings as the setting for the out-of-door appearance of the show, with flowers, palms, grass and trellis work in profusion.

BROOKLYN DEALERS NEED ROOM.

A Second Building May Be Necessary to Accommodate All to Seek Space.

So numerous and persistent have been the requests for space for the show which is to be held in the 23rd Regiment armory, Brooklyn, N. Y., Feb. 22-March 1, under the direction of the Brooklyn Motor Vehicle Dealers' Association, that the committee in charge is trying to devise some plan whereby additional floor space can be secured. The big armory will be taxed to its utmost to accommodate the exhibitors who have already made application.

Unlike shows held in most cities throughout the country, the cars in the armory will be located on one floor, making it unnecessary to climb stairs or use elevators to see them. The plan of decoration this year is upon a most elaborate scale and many conferences were held before the problem was solved.

BRITISH SECTION AT TORONTO.

Large Representation of Foreign Makes Expected for Comparison with American Product.

Although the Dealers' Association of Toronto, Can., received permission to use the armories for the automobile show this year, the space therein was entirely inadequate to accommodate the exhibitors, so the Government and Transportation buildings at the Exhibition were secured, making available about 100,000 square feet of floor space.

A feature of the show this year will be the British section, which will afford opportunity for comparison between cars of European manufacture and the American vehicles. It is said that machines made by all the British manufacturers will be shown and if this proves true it will be necessary to utilize the Horticultural building as well. E. M. Wilcox, who managed last year's show, is again in charge.

FOLDING INNER TUBES.

Many motorists, especially the novice, do not give the inner tubes that care these members require. Not only are they exposed to contact with the pump, jack and other tools carried in the tonneau, but often to grease or oil. The inner tube is not constructed to withstand the same severe service as a tire and the life of the rubber is decreased through being exposed to the action of lubricants, moisture or heat. The automobilist who endeavors to maintain his machine economically, follows the instructions of the tire maker in respect to care of the inner tubes. The Willys-Overland Company, Toledo, O., prints some interesting data relative to this subject and that section dealing with the folding of these members is given herewith.

To fold a tube in the most satisfactory manner, the valve stem should be removed so as to allow the escape of the air as shown at Fig. 1 A. The tube is next rolled up as tightly as possible, beginning with the end farthest from the valve, as indicated at B. This will enable the displacement of the air through the valve, but it will be noted that some will accumulate at the end because of the bend. By moving the valve and rolling the tube at the same time, all air may be removed and the tube rolled as shown at E.

The tube should be compressed to prevent air entering while the valve and cap are being replaced. Do not screw in the stem too snugly as it will make the work of inflating the tire more difficult. The valve should be adjusted and tested after pumping. The tube is now ready to be prepared for placing in the tube bag. Open up the tube as shown at C, keeping the valve in the centre, and fold each end inward as indicated at D, making a final fold as at F. The result will be a flat package. The folds may be secured by rubber bands and these may be made from an old inner tube.

If the tube be punctured it will be difficult to fold as the air will enter through the opening. The best plan is to roll it as outlined at E. This will enable one to distinguish at a glance whether the needed tube is in perfect condition or not. A small handful of soapstone or talc in the bag is recommended. By observing these precautions the tubes are always ready for immediate use.

COVERING THE RADIATOR.

If one is to make a cover for the radiator to protect the water against the chilling winds when operating, it is best to ascertain the height of the

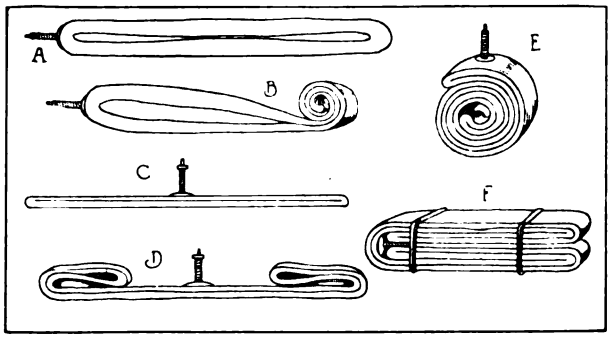

Fig. 1—Illustrating the Process of Folding Inner Tubes and How They Should Be Prepared for Storing.

cold fluid before covering that portion of the cooler. It should be remembered that hot water rises to the top of the radiator and that the cold settles to the bottom, this being demonstrated by the thermo-syphon system of circulation.

The writer has noted some drivers operating on extreme cold days with the top of the cooler covered and the lower fins unprotected. This is poor practise as the position of the cover should be reversed and the front of the radiator covered about half way to the top, depending upon the design of the motor and cooling facilities of the circulating system.

PROPER USE OF S WRENCHES.

The average motorist who makes his own repairs or adjustments will in time accumulate a set of S wrenches of various sizes and openings. They are indispensable in the garage and when used properly the nut or bolt is not damaged. The novice should learn how to handle these tools and at Fig. 2 are shown several suggestions for tightening or loosening nuts or bolts not easily accessible.

Sketches A to F illustrate methods of securing greater leverage when tightening a nut and when it is impossible to accomplish the work with a single tool. Those at C and E present the utilization of a piece of piping which is placed over the wrench to augment the leverage.

It is well to remember that when a hammer is employed with an S wrench for starting a frozen nut or bolt, the jaws should be fitted so that the impact of the hammer will tend to drive

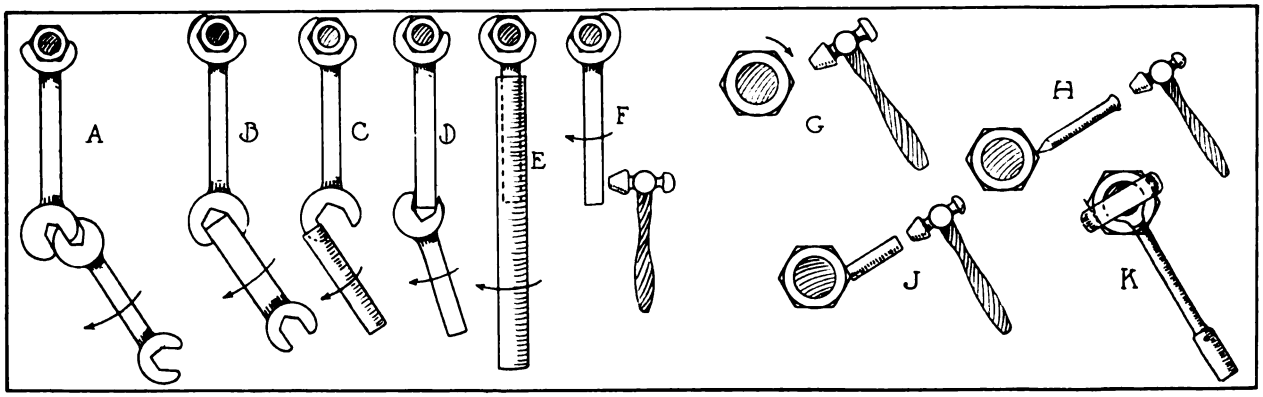

Fig. 2—Illustrating the Proper Use of S Wrenches: A to F, Showing Methods of Obtaining Greater Leverage; G, H, J, Suggestions for Starting Frozen Nuts.

them onto the nut and not off. If placed incorrectly the blow will cause slipping if not damage.

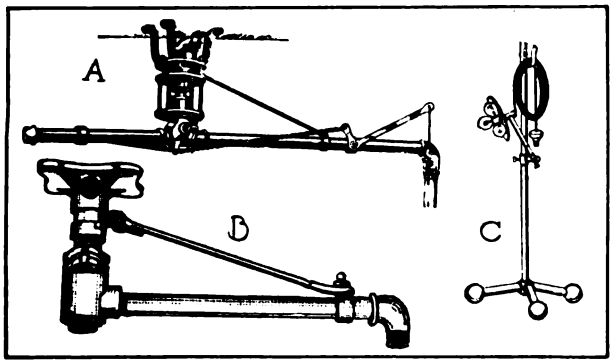
Sometimes the nut is so located that a wrench cannot be utilized because of lack of space. At G, H and J are shown methods of doing the work, and it will require but little practise to master the operations. A rigid piece of metal should be employed, an iron or brass bar for example, and never the cold chisel, which will ruin the nut. The blows with the hammer should be sharp and clean, and the force applied for a brief part of a second is sufficient to start or lock the nut or bolt. Slow and constant hammering should be avoided.

The box wrench, or as it is sometimes called, the clawfoot, is of service when some foreign substance has become lodged between the threads of the nut and bolt, and when tapping with a hammer is necessary to loosen the parts. The wrench is fitted over the nut and receives the impact of the hammer, thus saving the nut from damage.

In removing a small nut or union member from light tubing, and when it appears frozen, care should be exercised not to exert undue strain due to the leverage of the wrench. The best method is to fit the wrench and give the handle a light, quick tap, which will start the stubborn part without danger of twisting the tubing. The same method may be employed successfully in removing the hup cap from a wheel. Some of these members are thin and if considerable leverage is exerted through a long handled wrench, the metal may become bent out of shape. On the other hand a more solid cap will resist the leverage and may strain the spindle if considerable pressure is applied through employing piping over the handle of the wrench.

A common fault with the amateur repairman is to employ an S wrench that is too large; or in other words, the nut is smaller than the opening of the jaws of the tool. This results in damage to the nut by rounding off the corners.

OIL AND COLD WEATHER.



One cannot be too careful of the lubrication system in cold weather. While it is an excellent idea to utilize a light grade of lubricant for winter operation some employ a heavy or medium oil the entire year. If the motor has stood for any great length of time and the oil has become congealed, it is poor practise to race the motor after starting just to warm it up. The engine should be run slowly until the lubricant has had an opportunity to become fluid, and it is a good plan to observe this rule at all times when the motor clutch is disengaged. The various oil companies supply a chart showing the particular grade best adapted for winter use and to each type of motor.

EQUIPPING THE PRIVATE GARAGE.

Part III.

The fuel problem is one in which all motorists are interested, especially those having a ga-

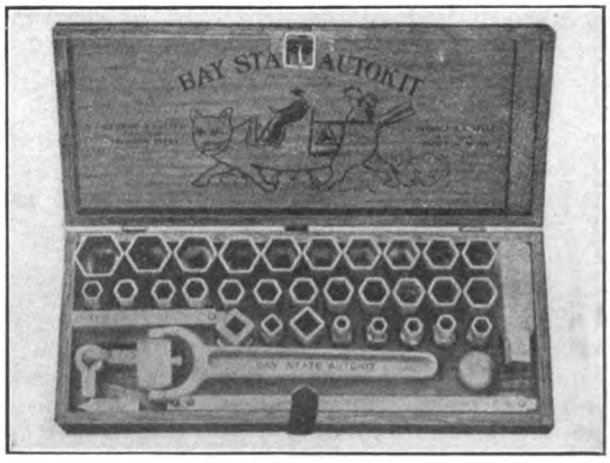
Washers of the Overhead Type: A, Irving with Automatic Cut-Off; B, Ever Ready; C, Portable Electric Light Stand.

rage on the premises or convenient to their place of residence. While some install a storage tank and purchase gasoline in large quantities, depending upon the size of the system, others prefer to buy the fuel in smaller amounts, especially when there is a service station in their neighborhood. Buying in large quantities makes for economy and convenience, however, and the question of fuel is one that is best settled by the owner. Some make it a practise to build a small shed some distance from the garage and house and by employing five or 10-gallon cans are able to secure wholesale rates from the tank wagon. Before making arrangements for the storing of gasoline it is advisable that the insurance people be consulted.

Washing the Machine.

The majority of owners having small garages wash and polish their cars and by so doing save a considerable sum each year. Others prefer to have the work done outside, but when convenient the installation of a washer will materially reduce the cost of yearly maintenance. This readily will be seen when the prices charged for washing and polishing are considered. Assuming that the rate is $1, which is conservative, and that the car is washed once a week, this means an outlay of at least $52 the year.

Practical washers may be secured at a reasonable figure, ranging from $10 upward, depending upon the design. In an accompanying illustration will be noted two designs for attachment to the ceiling of the garage, that at B being moderately priced and having a hose arm 4.5 feet long. The depth from the ceiling is but eight inches and the total weight is only 14 pounds.



That depicted at A is of higher grade and is provided with an automatic shut-off, incorporated in the top of the washer and equipped with a valve attached to a rod running down the centre of the washer to a cam at the bottom of same. When the water is turned on there is no pressure on the washer, as the valve shuts off the supply directly at the elbow entrance. The function of the valve member is to open and close the line of supply and this is superior to the old method of walking around the car to the faucet to shut off the fluid. It also prevents waste, making for economy.

Some types of washers are fitted with an electric light attachment, but this may be dispensed with by the use of the lighting stand shown at C. The latter will be of service in the overhaul as it is adjustable to any desired angle. One may be made if desired, by utilizing an old music rack and fitting to it a reflector, or by employing a drop light having a reflecting shield of the type outlined in a previous installment.

It is not absolutely necessary to purchase an overhead washer, although these are convenient in that the hose may be swung around the machine, as the ordinary hose may be utilized. The subject of washing the car will be taken up in logical sequence.

Purchasing the Tool Equipment.

In the selection of the tool equipment the motorist should exercise considerable care. Of

Bay State Autokit, Having a Large Number of Sockets, Ratchet Wrench, Etc.

course the number to be purchased will depend upon the work to be performed, but as there is a growing tendency on the part of the owner to at-

Digitized by Google

tend to the upkeep of his car, successful work will require proper tools. While the list presented may appear rather formidable and the cost prohibitive if the entire equipment be included in one purchase, by buying the tools one at a time and exercising good judgment considerable economy may be effected.

Allen Friction Wrench Set.

The majority of car makers provide a good equipment, but it will need supplementing if an overhaul of the machine is to be undertaken. It is better to purchase a limited number of high grade tools than a large number of cheap members and attractive prices do not always mean economy in the end.

In selecting the vise, which is one of the most essential tools, it is advisable to purchase one that will permit of handling large work. While a small member may be suitable for light material it will not withstand severe service and may mean the purchase of a new and larger one. One having at least four-inch jaws is recommended and the larger the opening the better. The difference in cost is very small and the larger is well worth the increased price.

Some are the swivelling type and have a locking arrangement, but the ordinary member will serve. It should be securely anchored to the bench by bolts or cap screws and free from all play. A suggestion for fitting the handle with rubber rings is worth consideration as by placing the material near the ends the metal is saved from damage when the vise is being worked.

Box or Socket Wrenches.

The writer strongly recommends the purchase of a set of box or socket wrenches. There are a number of different sets upon the market and when the amount of work these handy tools will accomplish is considered, to say nothing of time and jammed fingers saved, they are cheap in comparison with ordinary tools. They make for economy in that when properly used, nuts and bolts are removed or tightened without damage, and this is especially true when they are located in places not easily accessible with the S or other wrench. It should be borne in mind that the use of a cold chisel and hammer for starting a frozen or refractory nut means that it will have to be replaced by the same method, and frequently a new part will be required.

The average set contains a large number of steel sockets of both hexagonal and square shapes, ranging from .3125 to 1.28125 inches by thirty-seconds, and with such an equipment the removal of the smallest as well as largest nut or bolt is accomplished easily and without damage. The kit usually includes a long and short extension for use with a universal joint, which makes possible the handling of bolts where the space is limited. With a little practise one can tighten nuts in places which appear to be almost inaccessible.

Some of the wrenches have swivelling, reversible ratchet handles, making possible the removal of nuts, etc., by a ratcheting motion, and where there is not room to swing an ordinary wrench. Types of this kind are shown in the Mossberg and Bay State outfits presented in accompanying illustrations. The Allen wrench differs from these in that it operates upon the friction principle. As previously pointed out there are a number of different designs, those illustrated being presented to show the components of the set. They are moderately priced and make possible the accomplishment of work requiring a large number of ordinary wrenches.

(To Be Continued.)

Miss Victoria Clerke, a progressive young woman, has successfully established an automobile agency, the northern boundary of which reaches into the Arctic Circle. Her territory, centred at Humboldt, Saskatchewan, Canada, includes that province and the vast areas of Alberta and Mackenzie. Miss Clerke is the representative of the Imperial Automobile Company, Jackson, Mich., maker of Imperial cars.

The Mossberg Wrench Is of the Ratchet Type and the Outfit Is Very Complete.

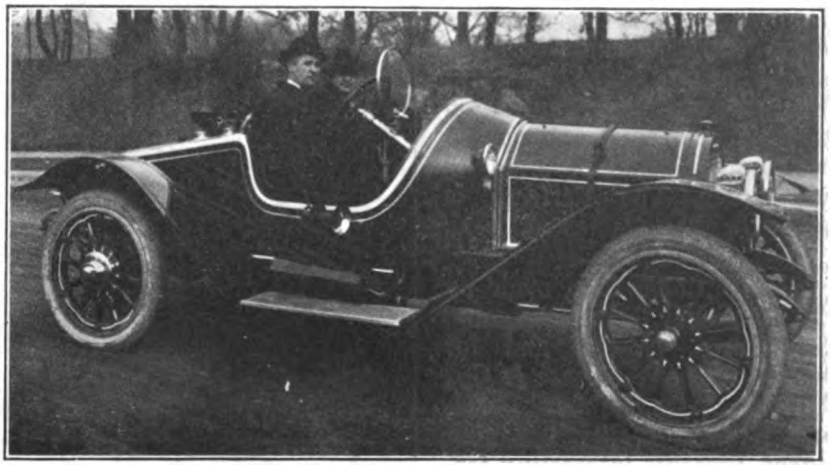
NEW DIXON CATALOGUE.

Valuable Work Concerning Lubrication Available for the Motorist and the Trade.

The largest and most complete catalogue ever issued by the Joseph Dixon Crucible Company, Jersey City, N. J., is being mailed to the manufacturer, jobber, purchasing agent and others interested in graphite, crucibles, lubricants and other products of this company. Altogether over 100 pages are devoted to illustrating and describing the Dixon product.

The new booklet has a neat cover design, which is presented in the accompanying illustration, and its contents will prove of value to the motorist in that the subject of lubrication is fully treated in an interesting manner. Copies will be mailed free upon request.



PATHFINDER DRIVERS NAMED.

Robert Speigel and Dr. Charles G. Percival Will Act as Cross Country Pilots.

When the Indiana automobile manufacturers hold their third annual tour, which this year will be from Indianapolis to the Pacific Coast, one or more Pathfinder cars, made by the Motor Car Manufacturing Company, Indianapolis, will be entered. These machines will be driven by two well known veteran cross country pilots.

One of these is Robert Speigel, who achieved considerable fame in the Los Angeles to Phoenix road race, and the other, Dr. Charles G. Percival of New York City, the pathfinder and traveller, who has just written an account under the title of "The Trail of the Bull Dog," of his famous two years' journey of 50,000 miles, extending from Mexico to the borders of the Arctic circle. With two such drivers there is hope that the Pathfinder will complete the coming tour with a perfect score.

The tourists will leave Indianapolis July 1, but the exact details of the itinerary have not been decided upon as yet. Both of the Pathfinder drivers are thoroughly familiar with all the roads leading into these cities. An accompanying illustration shows them in a Pathfinder cruiser model, the picture having been taken in New York City during the progress of the recent show.

Robert Speigel and Dr. Charles G. Percival in Pathfinder Cruiser Model in New York City.

SAVANNAH MAY HAVE SHOW.

Suggestion That Display Be Held in Connection with National Racing Classics.

Harvey Granger, president of the Savannah Automobile Club, under whose direction the Vanderbilt Cup and Grand Prize races will be conducted at Savannah, Ga., next fall, states that the club will lend its moral support to a mammoth automobile show which has been suggested in connection with the races. The club cannot, however, assume charge of such a show, because of the fact that it will have all it can handle in caring for the race arrangements.

The proposal is to have a show under canvas, at which admittance will be free, thus giving the manufacturers exhibiting the utmost advantage of the affair. Plenty of room would also be available for road demonstration of both pleasure and commercial vehicles.

In the French quarter of New Orleans, La., laid out nearly 200 years ago, there has been great difficulty in handling the traffic, owing to the narrowness of the streets. In the last report of the chief of police he states that owing to the increased use of motor vehicles it is now possible to reduce the traffic squad materially in the old part of the city. When horses were used altogether the lives of pedestrians were often threatened by the animals becoming unruly in the congestions at street intersections.

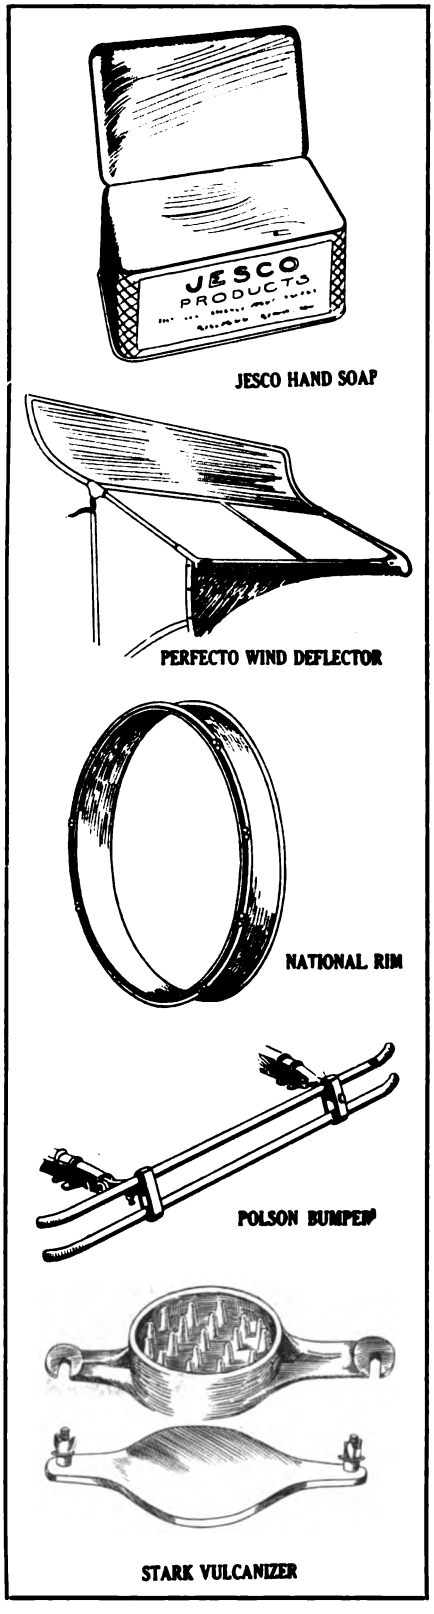
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



Jesco Hand Soap is manufactured by J. Eavenson & Sons, Inc., Camden, N. J., and comes in tin boxes, 36 to a case. One of the qualities emphasized with the preparation is that it will remove dirt or grease without injury to tender hands. It is held by the maker that the soap is free from grit or other abrasives and that it imparts a clean smoothness to the skin.

—★—

The Perfecto Wind Deflector is the product of the Perfecto Wind Deflector Company, 67 Church street, Boston. It is designed to deflect the wind in such manner that back draughts are avoided. Being constructed of fibreloid it is claimed that injury through a collision is reduced to a minimum. One of its qualities is that it may be taken apart in a few minutes and an entire new panel inserted at a small cost. The shield may be adjusted to any desired height or thrown forward to accommodate one entering the car, and it is held that it can be attached to any form of dash. A device on the filler board permits of the shield being raised in warm weather to provide ventilation and side curtains make possible the exclusion of draughts in winter. The Perfecto is made in various sizes.

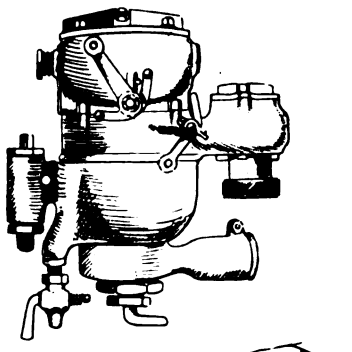
—★—

The National Rim, made by the National Rim Company, Tarrytown, N. Y., and for which Walter A. Frese & Co., United States Rubber Building, New York City, is selling agent, presents interesting features of construction in that a tire may be removed and a new one fitted quickly and that the shoe is held securely in the event of a blow-out when travelling at high speed. The rim proper is of pressed steel, having punched slots on its outer periphery, and through these apertures project movable lugs. When the tire is inflated the side pressure locks the outside and removable ring against the lugs and the latter against the rim. When the tire is deflated the lugs remain in position until disengaged, which operation is accomplished easily by the thumb. This is done by pressing downward on the lug, which is spring retained and fitted with a pivot device, making it possble to hold out the lug until the ring and tire are removed and replaced. After fitting the tire and ring the lugs are moved into engagement with the slots and locked automatically. It is obvious that the ring cannot leave the rim because of the retaining lugs and that the construction makes changing tires a simple operation. Among the qualities emphasized with the National rim are: Non-rusting, easy operation, no parts to become loose or lost and perfect safety in use.

—★—

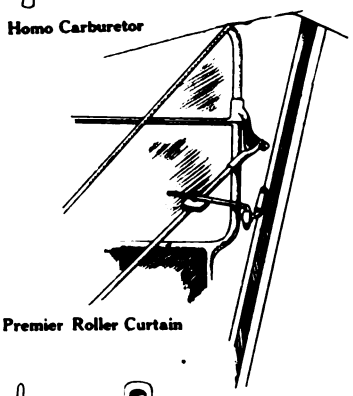
Stark's Improved Vulcanizer is manufactured by the Electric City Specialty Company, Buffalo, N. Y., and comprises two metal castings and two thumb screws. To vulcanize, an inner tube is placed between the parts with a patch and a prepared rubber placed over the puncture. A measured quantity of gasoline is poured into the pronged receptacle and lighted. The latter is so designed that the heat generated is regulated automatically and the patch is cured properly. The Stark vulcanizer is moderately priced and is guaranteed.

Digitized by Google



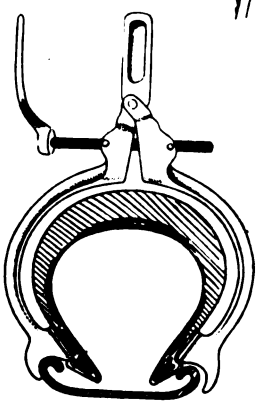
The Polson Universal Bumper, produced by the Polson Manufacturing Company, Buffalo, N. Y., has been improved and one of its features is that it is adaptable to any car with a pressed steel frame. It comprises a double protecting bar secured to the frame in a substantial manner by special clamps. The fittings are supplied in enamel and the bar in brass. Enamel or nickel finish is optional.

—— ★ ——

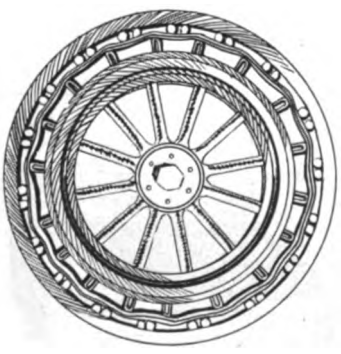


The Homo Carburetor, manufactured by the Homo Company of America, 3202 Oxford street, Philadelphia, presents interesting features in that the maker lays great emphasis upon its vaporizing thoroughly low grades of motor fuel. This is secured by the fuel passing through the Homo, located in the heart of the heat jacketed section of the carburetor, which device prevents liquid gasoline reaching the cylinders. It is held that the construction of the carburetor provides for a homogeneous mixture of air and fuel in correct proportions. Economy of fuel and high efficiency are also claimed for the Homo.

—— ★ ——



Premier Roller Curtains are manufactured by the Storm Front Company, Troy, O., and are of the quick detachable, roller type. They are made for both front and middle side and are neat and serviceable. They permit of enclosing the car quickly, with but little effort upon the part of the driver, and the top may be folded as easily as normally. That shown in the illustration is a front fixture attached to a fore door with glass windshield. The principle of operation is similar to that of a curtain shade, but more substantial and quickly operated.



Homo Carburetor

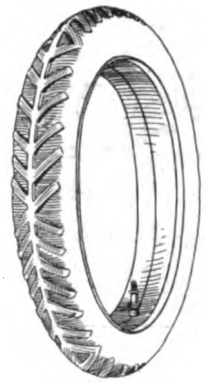
Premier Roller Curtain

Giant Tire Tool

Favary Tire

The Giant Tire Tool, made by the M. & G. Tire Tool Company, 134 Washington street, Providence, R. I., is a practical device which will appeal to motorists as with it tires frozen to the rim are easily removed. It comprises a pair of pivotally mounted jaws having flat extensions which engage the wall of the tire next to the bead or rim. Considerable pressure is secured through turning a handle which carries a threaded bolt extending through the jaw members, compressing these members and forcing the shoe away from the rim. The ends of the jaws are so constructed that they do not slip upward in the operation or injure the walls of the tire. The movement of the jaws in compression is limited, being sufficient to break contact of the bead with the rim. The tool will fit any sized shoe, is constructed of high grade material and is moderately priced.

—— ★ ——



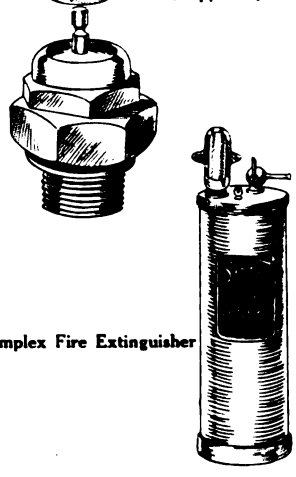
The Favary Tire, manufactured by the Favary Tire Company, Inc., 111 Broadway, New York City, is constructed upon the mechanical principle whereby resiliency is obtained by the flex action of a combination embodying pliable bands under tension. There are two of these, composed of extra strong belting or fabric, especially woven and water proofed. Series of aluminum blocks are secured to and interposed between the bands by tubular steel rivets. The large heads of the rivets rest upon the bands and their tubular section is opened on the aluminum blocks. Friction between the blocks and fabric is eliminated by solidly riveting these members. A quality of the construction is that the tread is made detachable, the oper-

Digitized by Google

ation involving the removal of the bottom blocks, which is accomplished easily. Another feature of the tire is that the locking mechanism is positive in its action. The principle involved in operation is as follows: Immediately under an applied load the bands dip downward, while adjacent thereto there is an upward movement due to the increased tension of the bands. It is held that the tension is quickly and easily adjusted to conform to the character of the roads and that resiliency is the chief feature of the tire. Its construction is such that skidding or side slipping is reduced to a minimum. Greater tractive qualities are claimed as well as efficiency. The Favary tire is adapted for both pleasure and commercial vehicles.

—— ★ ——

The Columb Anti-Skid Tire is manufactured by the Russian-French India Rubber, Guttapercha & Telegraphs Works, Prowodnik, Riga, Russia, for which the Russian Tyre Sales Company, 981 Eighth avenue, New York City, is agent. The tread surface is provided with a wide rubber rim, running through the centre of the outside of the cover and being reinforced by a number of ribs proceeding from the central member like a fish bone. These cross ribs are arranged at an angle, a construction which the maker holds affords an increased resistance against slipping or skidding. These groups of ribs run in alternate directions. Among advantages of the construction claimed are: Greater efficiency, non-skidding, better traction and less heating, due to the surfaces being kept cool by air passing through the channels of the ribs. The India rubber compound employed is also held to be unusually durable.



Prowodnik

Western Gas Filter

Snappon Spark Plug

Simplex Fire Extinguisher

Eureka Valve Grinding Compound

—— ★ ——

The Western Gas Filter is the product of the Western Brass Manufacturing Works, Marshall boulevard and 21st street, Chicago, and is a device for incorporating in the line between the carbide generator and the lamps. It is held to remove effectually any foreign substance, such as particles of carbide, water or acetone, from the gas, and it is designed for service with gas tanks as well. It is made in polished brass, 1.5 by six inches, and is moderately priced.

—— ★ ——

Snappon Spark Plugs are marketed by the Bingham Manufacturing Company, 227 Prospect avenue, N. W., Cleveland, O. As the name indicates they are provided with a terminal which is secured to the high-tension cable, and which snaps firmly into position. The construction facilitates the work of removing the spark plug from the cylinder. The retaining mechanism comprises spring actuated steel balls which grip firmly the positive electrode provided with a suitable recess.

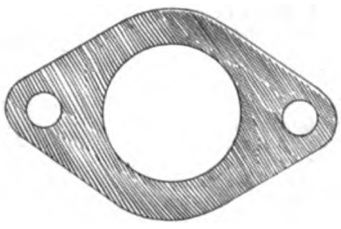
—— ★ ——

The Simplex Fire Extinguisher is manufactured by David Kahnweiler's Sons, 260 Front street, New York City, and comprises a cylindrical brass receptacle without interior mechanism, and a carbonet in a winged cap inserted at the top, with nozzle and stop cock. The vessel is filled with a combination of gases in a liquid state termed Simplex, which is held to contain no moisture and to be a non-conductor of electricity. It is also claimed that the preparation leaves no deposit and will not injure fabric, etc. The extinguisher

Digitized by Google

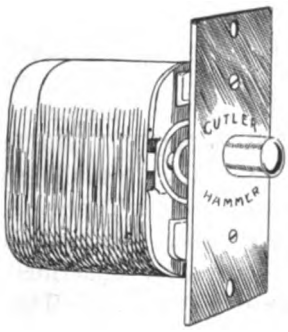
is operated easily, the turning of the winged cap piercing the carbonet and liberating the pressure, which is held to be sufficient to force the liquid a distance of about 30 feet. The blaze is enveloped by a gaseous blanket, extinguishing it by shutting off the supply of necessary oxygen.

—— ★ ——

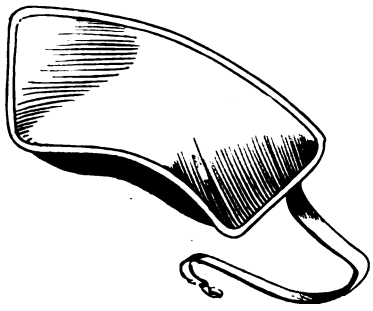


Eureka Valve Grinding Compound is produced by the Auto Equipment Company, East Orange, N. J., and comes in a neat box. It is adapted for the grinding of valves and it is claimed that the use of oil or gasoline is unnecessary. If the compound becomes too heavy it is moistened with a few drops of water.

—— ★ ——



The Elyria-Dean Speedometer, manufactured by the Dean Electric Company, Elyria, O., differs from other centrifugal speedometers in that four steel balls operate radially in grooves, so as to raise a cup shaped member and move the indicating hand over a long uniformly divided scale. This is accomplished without compensating springs or other modifying means being interposed. The dial is finished in black, a reflection proof color, and the markings or letters, figures, etc., are in white, a construction making for easy reading and at a considerable distance. The odometer is a Geneva movement and the trip member may be set to any tenth mile. The total and trip portions are actuated by separate mechanisms, serving as a double check on the mileage. Both the speedometer hand and the odometer movement operate in a right direction regardless of that of the shaft revolution, or whether the drive is on the right or left wheel.



Elyria-Dean Speedometer

Vellumoid

Cutler-Hammer Door Switch

Leasure Sanitary Shield

Vellumoid is a patented gasket material marketed by Charles D. Brown & Co., 49 Federal street, Boston. It is very tough, but pliable, and is impervious to the action of gasoline, kerosene, oils, water, etc. It is particularly adapted to motor cars for gaskets, either in hot or cold places, but is not suited to hot steam under pressure. Vellumoid comes in sheets, or rolls, and is constructed in differing thicknesses to meet individual requirements.

—— ★ ——

The Leasure Sanitary Shield is manufactured by the Sanitary Sales Company, Bradford, Penn., and is a combination eye and nose shield. It is sanitary in that it prevents the inhalation of dust or other foreign elements and also protects the eyes. The shield is made either plain, amber, blue or green, trimmed in colored leather or ribbon, and a neat leather case is provided for carrying it when not in service.

—— ★ ——

The Cutler-Hammer Door Switch is an electrical unit designed to close the circuit automatically and light the foot lamp when the door of the vehicle is opened. Closing the door extinguishes the bulb. The Cutler-Hammer Manufacturing Company, Milwaukee, Wis., is the maker and a feature of the device is its compactness. It is narrow, with rounded ends which fit the holes made by an ordinary bit, and it is held that it is a simple matter to install the switch. The insulating material is water and fireproof and the body and push bar are sturdily constructed. A strike plate, for mounting on the door against which the operating bar of the switch comes in contact, also is furnished.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

THE PRICE OF GASOLINE.

The price of gasoline has advanced from 50 to 80 per cent. since about the first of the year, this depending upon the section of the country, for it is maintained that certain dealers were able to purchase motor fuel at a better figure than others since last summer because of contracts which have not and will not be renewed. The situation is one of decided importance to the automobile industry, particularly as there does not appear to be any immediate suggestion that gasoline will be produced in such quantity as to warrant a reduction in cost.

This advance was not wholly unforeseen. Engineers have been busily engaged in experimentation for some years in an effort to find a suitable substitute. At one time attention was turned toward denatured alcohol, but whatever may have been the result abroad, it does not appear that relief is to be gained from this source here, particularly when kerosene is available in the present quantity.

There was some reason for surprise that no kerosene carburetors made their appearance during the recent show at New York City. It is more or less well known that engineers have been at work along this line for the past year, at least, and commercial vehicles utilizing kerosene or distillate as fuel have been giving satisfactory service in the West and on the Pacific Coast for a longer period.

The step from the grade of gasoline which has been supplied in recent years to kerosene is not as great as the average motorist may have been led to suspect. The chief problem involved is that of supplying the necessary heat to produce vaporization. That this problem will be worked out satisfactorily and within a comparatively short time is the expectation of those most intimately acquainted with the industry.

DEMAND FOR UNIFORM LAWS.

There is a hopeful sign in the editorial columns of the daily press with respect to the matter of uniform motoring legislation. That these papers reflect public opinion cannot be denied. At one time it seemed to be the chief aim of the legislators to enact laws which were bound to confuse the visiting motorist. With the more general adoption of the automobile, and perhaps the acquisiton of cars by the legislators themselves, more consideration has been given to the subject.

The legislative board of the American Automobile Association, of which Charles Thaddeus Terry of Buffalo, N. Y., is chairman, has done much to secure the repeal of certain laws and the enactment of others which tend toward uniformity. This board is engaged upon a campaign of education which is sure to bear fruit. A recent issue of Leslie's Weekly published an article by Mr. Terry, in which he made a strong plea for uniform and simple enactments governing the automobile and its use. In commenting upon this article the Chicago Inter Ocean says:

> There really seems no good reason why an automobile owner must be a perambulating encyclopedia of law to protect himself from becoming a criminal through ignorance. Yet that is the condition in which he finds himself at the present time. Every commonwealth and almost every community has a different set of statutes or ordinances governing the use of automobiles. * * * As Mr. Terry shows, it should not be difficult to make a set of laws which would have general currency throughout the country.

The Inter Ocean suggests that delegates from the various states meet and arrange a simple code which the several legislatures can enact, to

Digitized by Google

their own benefit and the vast accommodation of the increasing number of motorists. This plan has never been tried, except in a very limited way. Organized motorists would do well to advocate such action, and it is worthy of note in this connection that the automobile clubs of California have united for just this purpose with reference to existing laws in the various counties of that commonwealth.

TRANSCONTINENTAL TOURING.

The interest in good roads which has been awakened among the public spirited citizens of the West undoubtedly had its inception in the desire to urge motorists to visit that section in greater numbers. Those who have toured that portion of the country are enthusiastic over the possibilities. There seems little reason for going abroad, when there is so much to be seen at home, but until very recently there has been little incentive to make the attempt.

Good roads organizations are now busily engaged in developing the situation. The Indiana Automobile Manufacturers' Association is planning a tour to the Pacific Coast in July. Already there is much interest in the Panama-Pacific exposition of 1915, with a suggestion that the national tour, or the Glidden as it has come to be known, be held with that event as its objective point.

It would seem that the growth in transcontinental touring were sufficient argument to indicate the desirability of studying highway construction and maintenance. The commercial application of the motor vehicle follows the use of the pleasure car. The combination of good roads and motor haulage makes for the solution of economic problems, leaving out of consideration the money expended annually by tourists.

VALUE OF RACING.

About a year ago several manufacturers announced their intention of withdrawing from racing, because they were convinced that such contests had ceased to have value from a manufacturing standpoint. Those who remained in the field contended that there was still much to be learned in this manner. The year has passed and the first of the annual shows has been held.

At the New York display the visitor could not help but be impressed with the number of wire wheels on exhibition. Engineers representing makers who continued in the racing field contend that results obtained with wire wheels in such contests were sufficient to indicate that they were desirable equipment. It may be admitted that there was abundant evidence of their practicability to be found in their use on cars abroad, but it undoubtedly will be contended that racing has played its full part in placing them upon machines in this country.

It is unnecessary to go into the relative merits of wire and wood wheels in this connection. At the beginning of the 1913 racing season it seems to be indicated that the number of withdrawals will be few and there is a well defined rumor that some of those who retired a year ago will re-enter the field.

THE LONG STROKE MOTOR.

A careful consideration of the 1913 motors as presented at the New York show reveals a strong tendency toward the long stroke, particularly with the new designs. This is a practise which follows that in vogue abroad, particularly in Great Britain, where the long stroke was utilized, assumedly for the purpose of escaping increased taxation, the license fees being based upon the horsepower rating. The formula in use in Great Britain is the same as that adopted by the Society of Automobile Engineers in this country, and the bore is the chief consideration in determining the rating.

Last year more than half of the motors produced in America, or some 59 per cent., had a bore to stroke ratio between 1:1 and 1:1.20. Some 27 per cent. had a bore to stroke ratio of over 1:1.20. The figures at the recent show in New York City, which may possibly be taken as highly representative of the entire industry, indicate that about 43 per cent. now have a bore to stroke ratio between 1:1 and 1:1.20, while 56 per cent., most of these being new designs, have a higher ratio. The situation is interesting as suggesting the trend of engineers along this line.

Aside from suggesting the wonderful growth of the industry, the figures, elsewhere in this issue, indicating there are now 1,000,000 automobiles in America, afford opportunity to judge future possibilities.

THE CANYON DRIVES OF COLORADO.

(By James A. Harris, Jr.)

PROBABLY no state in the union offers a better combination of magnificent mountain scenery, unusual roads and good hotel accommodations than Colorado. Here are found the highest peaks of the Rockies, the deepest canyons, and the prettiest valleys, all of which can be seen more effectively by motoring than in any other manner.

The historic Santa Fe trail, running westward from Kansas, takes the tourist to Pueblo, in the southeastern part of the state, an ideal starting point for the mountains. Forty miles to the north is Colorado Springs, the road skirting the edge of the foothills. A few miles from the springs is Pike's Peak, Manitou, with its hot springs and caverns, and the Garden of the Gods, rich in fantastic rock formations.

First View of Collegiate Range, Continental Divide, Coming into Bueno Vista from Trout Creek Canyon.

The road leads straight north to Denver, with the entrance to the mountains only 15 miles away—at the mouth of Bear Creek Canyon. Right at the entrance is situated Red Rock park, named from enormous monoliths, rich red in color, which project upward from the lower slopes of Mount Morrison.

The ride up Bear Creek is extremely picturesque, the road following close to the winding stream. Climbing gradually, a low divide is crossed and the headwaters of the South Platte are reached, from which point a steeper grade begins up over Kenosha Pass, into South park. This is a large, level plain, shut in by lofty ranges on all sides and with an elevation of over 9000 feet. Here the mountains appear in all their grandeur, peak after peak outlined against the sky, each covered with snow.

The Park range, at the western edge of South park, is crossed over Trout Creek pass, and from here the road winds down the valley of Trout Creek, past the fortress like Castle Rocks, into the broad valley of the upper Arkansas. The ride up the valley into Buena Vista is magnificent. The Collegiate peaks of the Saguache range part of the Continental Divide, rise abruptly across the valley. Mount Princeton is directly abreast, with Mount Harvard and Mount Yale slightly to the north, all over 14,000 feet high and all white with snow.

Continuing up the gradually narrowing valley of the upper Arkansas, the road leads to Twin lakes, picturesque little mountain lakes nestling at the foot of Twin peaks, with Mount Elbert and Mount Massive, the two highest peaks of the Rockies, on either side. From Twin lakes there is a long, steady climb to the famous mining town of Leadville, the highest city in the United States, having an altitude of over 10,000 feet. The view from Leadville surpasses all description. There is literally a sea of snow capped mountains on every side, peak after peak rising in the utmost confusion with Mount Elbert and Mount Massive towering above all.

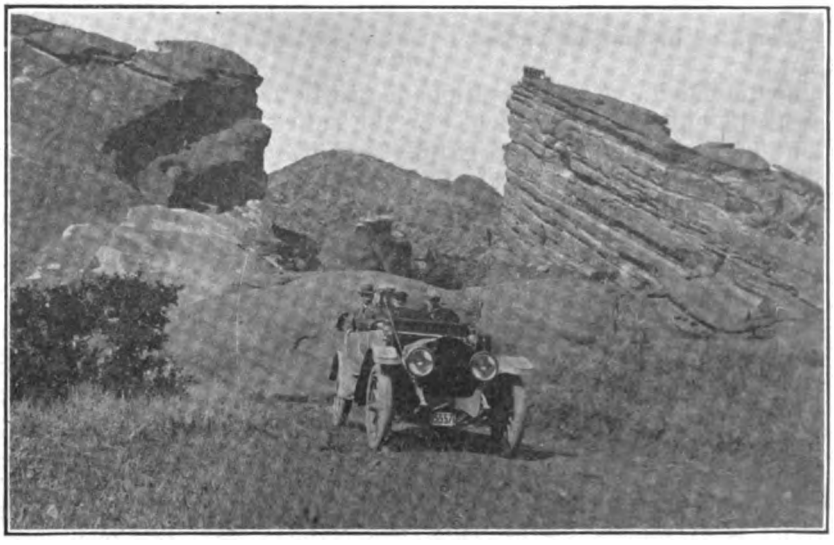
Tennessee pass, where the Continental Divide is crossed, is just north of Leadville, and only slightly higher in elevation. The trip over the pass is easily made and commences the descent down the western slope, by way of Eagle river canyon. The road here runs along the side of the canyon, sometimes to a height of 1500 feet above the river, through Red Cliff, and along the upper edge of the mining camps of Gilman and Minturn, which are literally glued to the cliff like side of Battle mountain. The view up the canyon from the edge of the mountain is magnificent. Far beneath one can see the river and the road

Digitized by Google

Leaving Salida, in the Arkansas Valley, with Sangre de Cristo Range in the Background.

just traversed, looking like tiny, winding threads.

After leaving Battle mountain the canyon changes to a valley, and a few miles further the road reaches the valley of the Grand river, which flows westward into Utah to join the Colorado. The descent down the valley is very gradual, and extremely picturesque, with high, deep red cliffs and battlements at either side. The trip down this valley continues for 30 or 40 miles and then the sides of the valley suddenly close in and the tourist finds himself in the canyon of the Grand, with the road cut out of the solid rock and the walls rising straight up to a height of over 1000 feet.



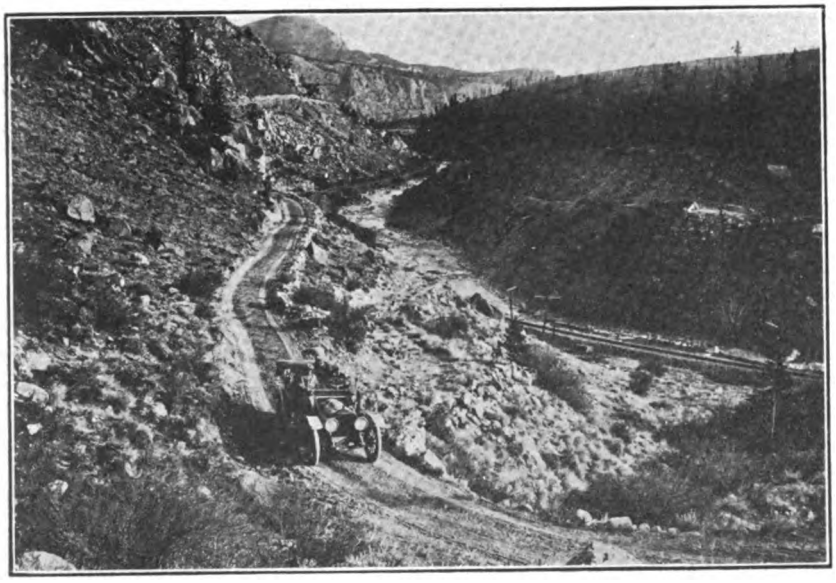
This ride through the canyon of the Grand is one of the prettiest canyon trips in the state, and once taken will never be forgotten. The road is extremely winding, now dropping down to the level of the river and now climbing a hundred or so feet above, the inside wall so close that it can be touched from the car. This canyon continues for 15 miles and at the lower end is situated the town of Glenwood Springs, and the well known summer hotel, the Colorado, with its wonderful hot springs and vapor caves. Glenwood Springs is also a favorite starting point for hunting parties, the wild mountain country to the north abounding with deer, bear and mountain lion.

After leaving Glenwood Springs the character of the country rapidly changes. The sharp peaks and granite rock formations vanish, and the high, flat topped mesas with prominent rim rock along the upper edge come into view. Stratified rock, of brilliant reds and yellows and browns, takes the place of the volcanic formations of the divide ranges.

About 50 miles down the river another canyon is entered, this time with wider and higher walls, intersected at frequent intervals by diverging canyons. Here the rock formation, both in appearance and coloring, closely resembles that of the Grand canyon of Arizona, only, of course, on a much smaller scale. This canyon extends westward for 25 miles to Grand Junction, near the Utah border line, and one of the fruit growing centres of the country.

Grand Junction is located at the edge of the vast desert which stretches away for over 100 miles into Utah. Here the mountains have been practically left behind, so a turn is made to the southwest and the return trip begins, over the Rainbow route, following up the valley of the Gunnison river, which joins the Grand at the junction.

Passing through the town of Delta, the road goes up over the Black Mesa, the top of which is more than 10,000 feet in altitude, and then follows the edge of the Black canyon of the Gun-



Some Idea of the Curious Natural Formations in Red Rock Park, Near Denver.

Digitized by Google

nison, with the river over 2000 feet below, straight down. From Delta a side trip well worth taking is south to Montrose and from there to Ouray, along the beautiful canyon of the Uncompaghre river.

The way leads along the top of the Black canyon for quite a distance, passing the Curecanti Needle, a spire of solid rock towering up from the edge of the river nearly to the top of the canyon wall. After leaving the canyon the route continues up the Gunnison valley, famous for its unexcelled trout fishing, to the town of Gunnison.

After leaving Gunnison the road enters the lower ranges of the divide, and the long climb to Monarch pass, crossing the Sangre de Cristo range, is begun. Monarch pass crosses the Continental Divide at an elevation of nearly 12,000 feet, the highest point reached on the entire trip. The hard climb to the top is fully repaid by the incomparable view which is obtained on all sides from the pass. From this high vantage point it is possible to see for miles and miles over the tops of countless peaks and ranges, with Mount Ouray boldly outlined against the southwestern horizon. The pass is covered with snow nearly the entire year and the air is extremely bracing, but not uncomfortably cold.

Going Up the Narrow Valley of the Upper Arkansas River, Near Leadville.

The descent down the eastern slopes of the Sangre de Cristo range is rapid, and Salida is soon reached, located on the headwaters of the Arkansas river. Following down the river the route is extremely pretty, with the Sangre de Cristo rising like an impenetrable wall behind.

The next stop is at Canon City, and here it is advisable to spend a day or so, taking several side trips which are too wonderful to overlook. Thirty miles to the north of Canon City lies the famous mining camp of Cripple Creek, the road to which leads up through the Phantom canyon of Four Mile creek. This canyon trip is one of the prettiest along the entire route, and is well worth taking. The scenery is different than that of the other canyon farther west, and an added charm is the little stream, which goes tumbling down in almost a continuous cascade.

Another interesting side trip from Canon City is the climb up through Priest canyon to the top of the Royal Gorge, about 10 miles from town. There are several observation points at the top, where it is possible to look over the edge, straight down to the river, 2500 feet below; and so narrow are the walls that in some places the railroad at the bottom is suspended above the water. The third trip of importance is the Sky Line drive, running for three miles along the very top of a steep ridge, from where one can see for miles over the country on both sides, with Canon City almost beneath.

Leaving Canon City, there is a choice of two roads. One leads to Colorado Springs and the other to Pueblo, each about 50 miles distant. This completes the triangular route through Colorado, of over 1000 miles, every mile of which is filled with the finest scenery to be seen anywhere in the world.

The illustrations accompanying this description of the canyons of Colorado were taken on a recent tour over these routes in a White six-cylinder car, made by the White Company, Cleveland, O.

Having for its object the improvement of the present and the construction of better roads in Nevada, the State Automobile Association has filed articles of incorporation with the county clerk at Tonopah, Nev. The incorporators are: Charles G. Patrick, C. R. Redmond, J. L. McCarthy, Victor Brandt, S. R. Moore, Gale Hoag and J. E. Stevens. The association will also foster the passage of the transcontinental highway through Nevada.

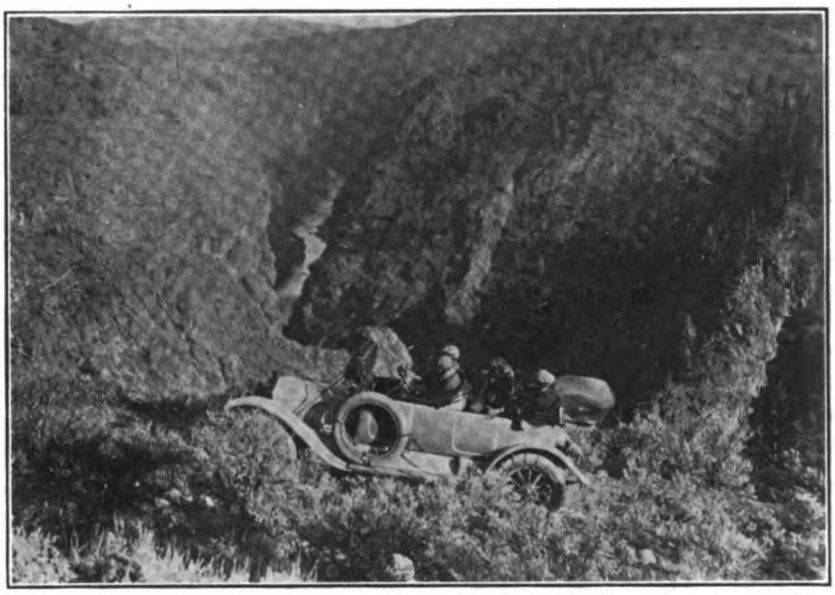
PANAMA-PACIFIC EXPOSITION.

Automobile Manufacturers and Allied Industries to Have Their Own Building.

Permission has been granted by the Panama-Pacific International Exposition to the National Association of Automobile Manufacturers to erect a motor transportation building on the 1915 exposition site. This structure is to house the most attractive automobile show ever held in the world, which is to last throughout the entire period of the international world's fair at San Francisco, Cal. Announcement of this is made by Director of Exhibits Asher Carter Baker, who states that the automobile manufacturers and allied industries, fully satisfied that the physical area of the Transportation Exhibits building did not permit space to be alloted of sufficient dimensions to accommodate their displays, asked permission to erect their own building.



This building was designed by G. Albert Lansburg of San Francisco and has been approved by the architectural commission. The design is one of the most modern notes in the composition of the exposition and harmonizes admirably with the general classic lines established by the commission. In the building the processes of manufacture and assembling will be shown and the importance and extent of this great industry will be placed before the world. The interior decorations promise to be the most attractive of any in the fair and will embrace one general scheme. The structure will be approximately 275 feet front by 800 feet deep and will cover over five acres.

QUEBEC-MIAMI HIGHWAY.

Work of Constructing Long Distance Touring Route Now Progressing Favorably.

Much progress has been made recently on the work of constructing the international route from Quebec, Can., to Miami, Fla., known as the Quebec-Miami highway, according to reports received by Howard D. Hadley of Plattsburg, N. Y., president of the association in charge of the project. More than half of the 2500 miles is now finished. About 400 miles more are under construction, while plans are being made this winter to begin work on the remaining 700 miles, so that the entire road may be finished by the fall of 1914. The stretch from Washington, D. C., to Montreal, Can., is finished, with the exception of five short strips now under construction. The total distance is 649 miles.

It is anticipated that the Quebec-Miami route will carry a heavier traffic than any other trunk highway in North America for three reasons: It leads through a region of historic interest; it traverses sections of great scenic beauty; it will form the main north and south artery through the most densely populated section of this continent. The 10 states, together with the District of Columbia and the Province of Quebec, through which the road leads, have a total population of 31,936,982, nearly one-third of the population of continental United States and Canada.

Looking Down into the Black Canyon of the Gunnison River, 2000 Feet Deep.

The name of Manhattan Automobile Club has been decided upon for the organization of which E. E. Schwarzkopf is organizer. It was arranged at first to call it the Automobile Club of New York, but this was found to interfere with a club already organized with a similar name.

W. J. McDowell of the General Vehicle Company, Long Island City, N. Y., reports the sale of a five-ton truck with Edison batteries to the Manhattan Brewing Company of Chicago.

MAFAN, A NEW GERMAN MAGNETO.

A new magneto which is of interest because of several novel features is the Mafan, manufactured by Hartmann & Braun, Ltd., Frankfort-on-Main, Germany. While it does not differ from the general outlines of accepted magneto design, it will be noted by the accompanying illustrations that many serviceable features have been incorporated.

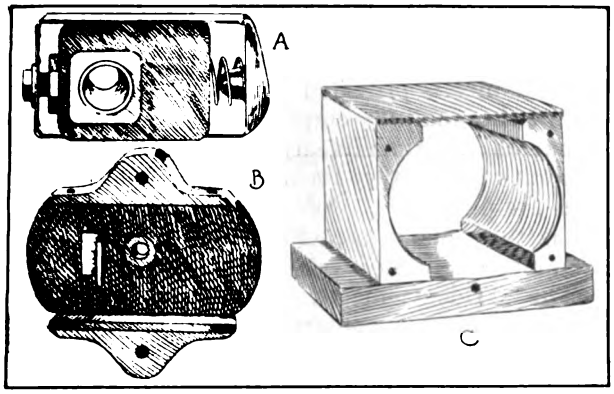
Additional stability is noted in the pole pieces,

Mafan Magneto, a New German Product, Having Permanent Magnets Retained by Plate Clamps.

these being secured by a covering piece riveted to the base plate. On the finished instrument the pole ends are covered by plates, making for a water proof armature case. It is also claimed that the construction permits of greater accuracy in machining and grinding, allowing a smaller air space and making for greater efficiency.

The safety spark gap is made of steatite and is constructed integral with the high-tension carbon brush, and any excess of current generated by the machine is taken care of. The permanent magnets are not retained by screws or rivets, but are clamped into position by means of two sturdy and ingeniously constructed plate clamps. The contact breaker is of the parallel type, dispensing with the use of a spring trembler. The slide holding the contact surfaces reciprocates in a straight line in a well insulated and mounted frame. It is easily detachable, and by turning a bushing can be changed from operating in a clockwise to an anti-clockwise direction or vice versa. It is claimed that at speeds of 6000 revolutions a minute the interruptions are very regular. The spark is tested under pressure at seven atmospheres.

Provision is made for easy timing. Mounted on the high-tension spindle is the usual gear wheel, and near the outer edge of this member are drilled two holes, which may be brought into register with apertures drilled in a frame cross member. In timing a four-cylinder motor two of the holes are brought into register and a pin inserted. The second set of openings is utilized for obtaining the correct armature position for the third cylinder.



The spring cap oil cup, utilized on locomotives, is employed. Pushing back this cap shuts off the ports to the feed pipes, and when a charge of lubricant is inserted, releasing the cap member opens the ports, and the oil is conducted by means of pipes to the ball bearings and other running parts of the magneto.

An interesting feature of the instrument is the provision made for controlling automatically the advance and retard of the time of spark. Two flexible chains are enclosed in a case and have springs between the different links and the inside diameter of the housing. By this means the armature speed is retarded and is suddenly accel-

Digitized by Google

erated prior to the ignition period when starting the engine.

It is held that a hot spark is secured at all

Detail Construction of Mafan Magneto: A, Showing Parallel Type of Reversible Contact Breaker; B, Fibre on Contact Breaker Is Oil Treated; C, Design of Pole Pieces Makes for Stability.

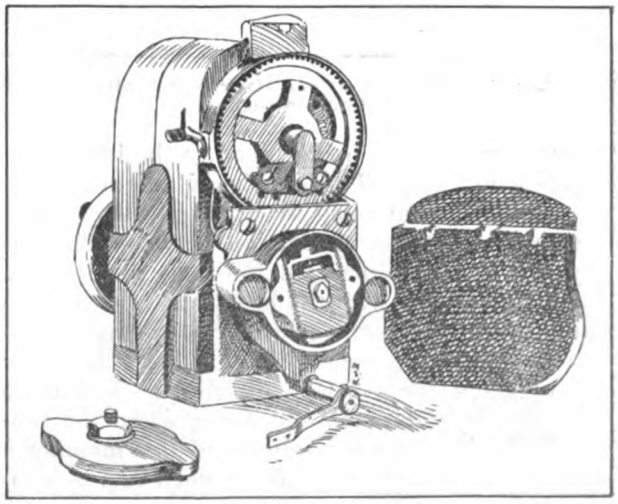
speeds and it is also claimed that the limit of angular adjustment may be increased from the usual 30 or 40 degrees to 75. The automatic ignition adjustment is so constructed that it can be fitted to any ordinary standard magneto employing coned shafts.

NEW BEARING METAL.

A new bearing metal is being marketed abroad, called phosforum, and it is particularly adapted for plain bearings. One of the difficulties encountered in the selection of a suitable metal for this purpose has always been in regard to the homogeneity of the cast material, in which segregation occurs. The new metal is cast in stick and bushing form and it is said to eliminate entirely the troubles experienced through occasional variations in metalling and casting temperatures.

TO BLACKEN ALUMINUM.

Aluminum may be blackened. The surface of the material to be colored is polished with very fine emery powder or finest emery cloth, after which a thin layer of olive oil is poured over and the part heated slowly over an alcohol flame. To obtain uniformity of the coating the part is treated to a second coat of oil and heated. Under the action of the heat the metal turns first brown, then black, according to the degree of heat. When the desired color has been obtained the metal is polished, after cooling, with a woolen rag or soft leather.



A second method is to prepare the following solution: White arsenic, one ounce; sulphate of iron, one ounce; hydrochloric acid, 12 ounces; water, 12 ounces. When the arsenic and iron are dissolved by the acid, add the water. The aluminum to be blackened should be thoroughly cleansed and washed before immersing in the bath. When the color is sufficient, remove and dry off with fine sawdust and lacquer.

ANNEALING STEEL.

The following formula for annealing steel is given by the D. T. Williams Valve Company, Cincinnati, O.: For small pieces of steel, take a piece of gas pipe two or three inches in diameter and put the pieces in it, first heating one end of the pipe and drawing it together, leaving the other end open to look into. When the pieces are a cherry red, cover the fire with sawdust, and leave the steel over night. A charcoal fire should be employed.

BELT GLUE FORMULA.

A glue for belts may be prepared as follows: Soak 50 parts of gelatin in water, pour off the excess fluid and heat on the water bath. Stir well and add first by weight, five parts glycerine, 10 parts turpentine, five parts linseed oil varnish and thin with water as required. The ends of the belt to be glued are cut off obliquely, the leather warmed and the hot glue applied. The united

Contact Breaker, Distributing Box and Other Parts of Mafan Magneto Are Very Accessible.

parts should be subjected to a strong pressure and allowed to stand at least 24 hours before the belt is used.

GARAGE AND REPAIR SHOP EQUIPMENT.

THE HYDRAULIC SYSTEM.

Among the factors of a gasoline storage system to be considered are: Freedom from evaporation, safety and economy of operation. A system presenting interesting features is the Hydraulic, manufactured by the Hydraulic Oil Storage Company, 90 West street, New York City. The principle involved is not new and as the name implies, water plays an important part. It is the difference between the weight of gasoline and water and the fact that these fluids will not mix, that govern the operation of the system.

It comprises the storage tank to which is led

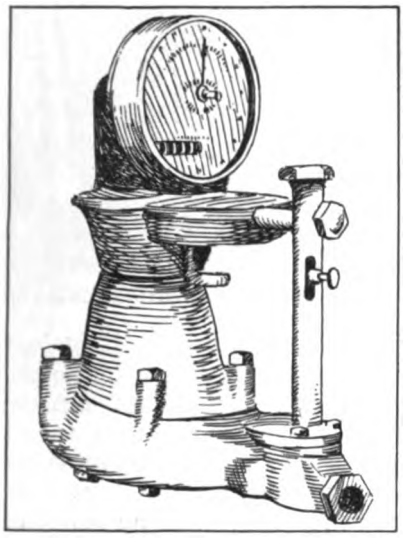
Showing the Operation of the Hydraulic System and Its Components.

the water, the fluid being piped to the lower part of the container. The supply or amount fed to the vessel is controlled by a water valve, which member closes the connection between the supply and the gasoline tank. When the lever of the water control valve is lifted, water enters the tank, lifting and forcing the fuel out through the draw-off pipe, thence to the gasoline tank of the car or other receptacle to be filled. A drain is provided for removing the water when the tank is to be refilled with gasoline and this member is automatic in its action, closing when fuel is being drawn from the large tank. The system is operated easily. To draw fuel the lever of the water control valve is lifted as shown in an accompanying illustration.

Clean gasoline is secured through all dirt and foreign elements dropping to the bottom of the tank, whence they are removed when the water is drained as the vessel is being refilled with fuel. The system permits of the use of all the fuel and the container is provided with a gauge member. One of the qualities emphasized by the design is that as the tank is always completely filled evaporation and the formation of combustible gases are prevented. Another feature of the system is that pumps are eliminated and that considerable time is saved as well as fuel.

The Trident meter, utilized in connection with the system, is constructed in two forms, that illustrated being designed for garages, service stations, etc., and is particularly adaptable where a large number of cars is to be filled daily. The dial is placed vertically on the meter for convenience in reading and is large enough to be seen for a considerable distance. The main register is known as the straight reading and records continuously up to 100,000 gallons, after which amount is drawn the figures automatically return to zero.

An auxiliary or set-back register is provided, recording in parts of a gallon up to 10. It is so arranged that it can be set back to zero any time by simply turning the hand. For example: If five gallons are desired, when the large hand reaches five, that amount has been drawn. The large pointer can then be turned back to zero. The continuous register denotes the total amount regardless of the number of times this dial hand is utilized. The flow of the fuel after the desired amount is secured is automatically shut off. No gasoline can be drawn without its being recorded and the company holds that this feature enables a check to be kept upon the daily, weekly and monthly sales. Complete descriptive matter will be mailed upon request.



SHAW VISE FOR MACHINE WORK.

A vise that differs from conventional construction is the Shaw, brought out by an English concern and especially adapted to automobile work. It is a flat vise having a top and bottom grip, comprising a plate having a bolt let into it as shown in an accompanying illustration. A dog plate and a nut are fitted over the bolt member. This device is intended to be held in the jaws of an ordinary bench vise, either of the leg or parallel type, and small finished articles, such as bushings, terminals, small screws, nuts, etc., can be held and worked with ease.

AMERICAN COMPRESSORS.

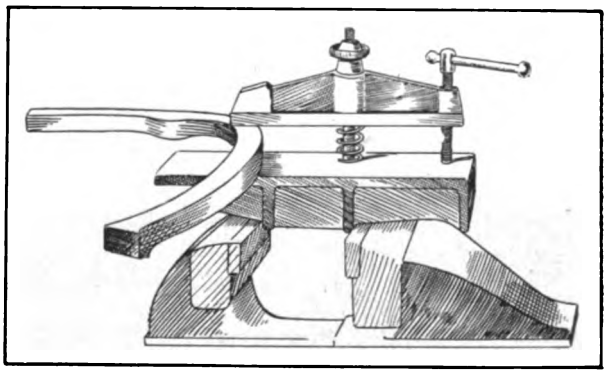
The American Steam Pump Company, Battle Creek, Mich., maker of pump machinery, is manufacturing a line of motor and belt driven air compressors for garage and service stations. The design known as size 1 is compact and the entire outfit includes electric motor, compressor, air tank and automatic controller. The last named is mounted upon a slab 14 by 16 inches, with gauge, switch and fuse blocks, and is perfectly automatic in its action, stopping and starting the compressor at adjusted pressure limits, which may be changed readily as desired. The motors are constructed for alternating or direct current, single phase or polyphase and the best of material and workmanship is incorporated.

Trident Auto-Stop Meter Utilized with Hydraulic System.

The compressors have cross heads with adjustable bronze shoes working in bored guides, bronze connecting rods and cranks of forged steel. All bearings are adjustable for wear. The company also manufactures two-stage belted compressors. Special discounts are offered to the trade and a catalogue will be mailed upon request.

LUBRICATING OIL CABINETS.

In handling lubricating oil it is important that the fluid be kept free from dirt or dust as the foreign elements act as an abrasive, cutting bearings. The Milwaukee Tank Works, Milwaukee, Wis., is manufacturing a lubricating oil cabinet which is constructed of heavy steel and to withstand severe service. It is provided with a pump of the self-measuring type and pints are handled as accurately as larger quantities. A quality claimed for it is that it will not drip. A lock and keys are fitted if desired. A measuring gauge indicates the quantity of oil on hand. The cabinets are made in barrel sizes, varying from one to five. The smallest member is 17 inches thick, 29 wide and 30 high, and weighs 185 pounds. All cabinets are guaranteed. Catalogue and price list will be forwarded upon application.



SEAMLESS STEEL TANKS.

With the very general adoption of compressed air in the garage and repair shop the use of a tank for storing the air is essential, especially when the compressor outfit does not include one of these members. Janney, Steinmetz & Co., Philadelphia, manufactures a wide variety of seamless tanks for various air installations, as well as for other uses. Catalogue and descriptive matter will be mailed free of charge upon request.

COES WRENCHES.

Strength without bulk or clumsiness is a desirable quality of wrenches for the repair shop and the tool must be capable of being handled easily and without bruising or slipping. The all-metal wrench has found favor among workmen owing to its ability to withstand severe usage. The Coes Wrench Company, Worcester, Mass., well known maker of this line, is issuing instructive literature concerning these tools which will be forwarded upon request.

Shipments of automobile tires from the United States during November, 1912, to the value of $275,360, marked a gain of $98,150, or 35 per cent. over $177,210, the value of the tires shipped abroad during the same month of 1911. For the first 11 months of 1911 the value was $2,257,727, and for the same period of 1912, $3,034,699, a gain of 34 per cent., or slightly less than the increase for November, 1912.

The Shaw Flat Vise, Especially Adapted for Machined Work.

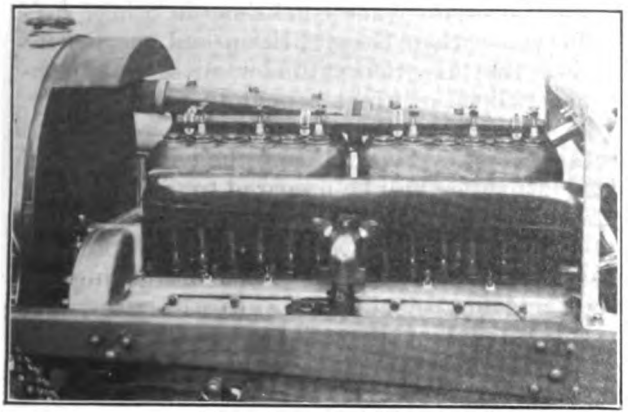
A British car which presents unusual features is the new 30 horsepower, six-cylinder Sheffield-Simplex, made by the Sheffield-Simplex Motor Works, Ltd., Tinsley, Sheffield, England. It is a development from the 25 horsepower model produced heretofore, but is characterized by a number of innovations, notably the worm driven rear axle and the four-speed transmission. A study of the accompanying illustrations will indicate that the design differs materially in some respects from what has come to be regarded as conventional American practise.

The motor has a bore of 3.5 inches and stroke of five, giving a rating of 29.4 horsepower under the R. A. C. formula, which is the same as that of the S. A. E. in this country. The six cylinders are cast in blocks of three with a plain bearing between each cylinder. They are of the L head type, the valves being on the left, and being enclosed in quickly detachable covers. The valves are operated through rollers mounted on rocker arms, the latter projecting from the sides of the engine and being held to the cams by light leaf springs. Both the camshaft and the magneto are driven by silent chain.

Lubrication is by pump circulation to all parts of the motor through a hollow crankshaft of specially strong construction. Cooling is by water, the thermo-syphon system being utilized. The radiator is of distinctive design, being spherical in shape and slightly convex. This is mounted on trunnions bolted to the chassis frame members at the front. All water pipes are of large diameter and the outlet manifold is an aluminum casting, part of which is formed with the base chamber. Cooling is still further aided by a fan located in the flywheel.



The carburetor is a Zenith. The exhaust pipe gradually increases in size toward the rear, and has leads cast in it for jacketing the inlet pipe, which has two large leads only, the rest being cast in the main cylinder casting. An air pump is fitted to supply pressure to the fuel tank, which is located at the extreme rear of the chassis.

Side View of the Sheffield-Simplex Six-Cylinder, 30 Horsepower Chassis for 1913, Presenting New Features of Design with This Company.

Digitized by Google

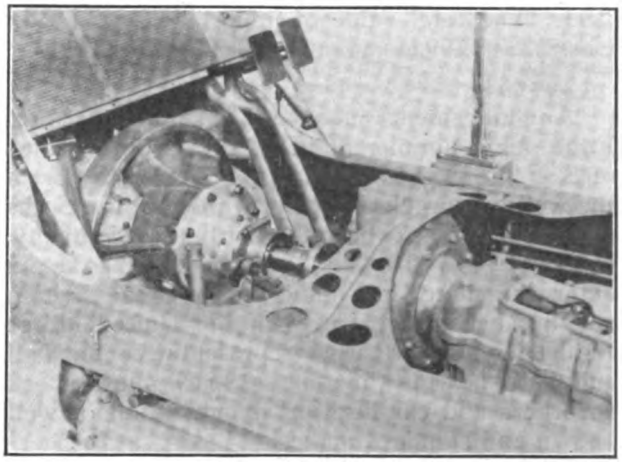
The magneto is a Bosch water proof, high-tension, self-starting instrument, placed at the right of the engine, and beside it is the dynamo

Valve Side of Six-Cylinder Sheffield-Simplex Motor, with Detachable Covers Removed.

for the electric lighting system. The wiring is unusual, in that the high-tension members are molded into one and enclosed in a solid ebonite casing. The leads to the plugs consist of small brass levers which may be detached while the engine is running by means of ebonite handles.

The clutch is of the multiple disc type, lubricated with dry graphite. The four-speed gearbox is located in the centre, instead of further to the rear as in previous models. This is incorporated with the torque tube and moves with it, and is supported at the forward end by a large spherical joint. At the rear of the gearbox the propeller shaft is enclosed in a tubular steel member, which is bolted directly to the aluminum worm and differential casing. The main universal joint on this shaft is enclosed in an oil tight spherical bearing and works in a bath of lubricant, its centre being concentric with that of the combined torque and radius rod. A side view of the chassis herewith shows the construction and the location of the gear shift and brake levers.

Two independent sets of brakes are fitted, actuated by hand and foot, respectively, and both are of the internal expanding type acting directly on large drums on the rear wheels. A noticeable feature of these drums is the utilization of radiating fins for the purpose of maintaining them in a properly cooled condition. The brake control rods are divided in the centre and supported to prevent excessive whip. Special means of adjustment are provided for taking up wear without affecting the original position of the levers or pedals.



The worm driven rear axle is with a worm of the Lanchester type, stiffly mounted under the wheel with a ball thrust bearing running in oil, and all extremely accessible. Springs are semi-elliptic in front and Lanchester type, inverted semi-elliptic in rear. The frame is with a double drop, giving a very low entrance to the car without reducing the road clearance. Either detachable wire or steel wheels are fitted upon option, with one extra wheel.

Several American automobiles are in use at Riga, the Russian Baltic region, these being brought in by way of St. Petersburg and Moscow, and they appear to be giving satisfaction, according to reports. The German Benz is popular, being constructed especially for the bad roads of that section. A recent local competitor in this field is the Baltic Car Works at Riga, which uses German motors in its product. The Prowodnik Rubber Works, also of Riga, employing more than 8000 men, not only supplies local demand for pneumatic tires, but exports them to the United States, Germany and other countries. The Russian Baltic region is in need of motor trucks of large capacity, utilizing naphtha or operating on the anthracite gas-generating principle. Gasoline costs about $1.92 for 36 pounds. The poorest grade sells at 25 cents a gallon.

—— ★ ——

Conditions for the French reliability tour, the Tour de France, which will be held March 1-15, covering 3000 miles, point to a better test than was the case last year. The selling price of contesting cars must be under $1600 and the daily

Illustrating Gearbox Location and Large Universal Joint Employed on Sheffield-Simplex.

run will average 160 miles. Cars cannot be accompanied by supply cars as in previous runs, supplies being obtained from the regular dealers

Digitized by Google

in towns along the route. The run will be of the sealed bonnet type and the sealing provisions this year are a new feature. There will be two sets of seals, one being known as permanent, the other as daily. The permanent seals will be applied at the start to the axles and steering gear and cannot be removed without penalty. The daily seals will be broken every morning to allow for filling the tanks and making adjustments. These seals will be applied to the hood, radiator filler cap, underpan and footboards covering the clutch and transmission. Penalties for breaking seals are: Two points for radiator seal; three for the underpan or floor boards and four for the bonnet.

—— ★ ——

Although American competition in the automobile trade in the United Kingdom was keener in the first 10 months of 1912 than in any corresponding period of previous years, the British motor car business increased materially, both in the business at home and in exports. The imports of foreign cars into the British empire also increased considerably. From figures compiled by Consul Albert Halstead at Birmingham, England, the number of complete automobiles exported from the United Kingdom during the first 10 months of 1912 was 4083, valued at $7,611,021, an increase over the same period in 1911 of 574 in number and $757,592 in value. The total value of the exports of motor cars, including complete cars, chassis and parts, for the 10 months was $14,151,782, an increase of $1,802,250 over the same period in 1911. The increase in the export of motorcycles continues, 10,491 being sent out in 1912, valued at $2,047,813, a gain of more than 100 per cent. for the corresponding 10 months of 1911. The total value of imported cars in 1912 was $13,393,499, as against $10,300,025 in 1911.

—— ★ ——

Announcement has been made that S. F. Edge, for a number of years the leading genius of S. F. Edge, Ltd., London, England, maker of the well known Napier cars, who several months ago severed his connection with that company, ostensibly to retire, has been persuaded to again enter the motor car industry in Great Britain and has become chairman of the United Motor Industries, Ltd., British representative for ball and roller bearings, magnetos, spark plugs, shock absorbers and car lighting dynamos, all of well known and standard makes.

E. de Rodakowski, who has been chairman, has resigned that position to become managing director of the concern. Mr. Edge's untiring energy and sound and helpful advice have brought success to the Napier business and his co-operation with the United Motor Industries, Ltd., will surely mean a further expansion of the business of that company. It is understod that during the next year or two he intends to investigate motoring and motor trade conditions in other parts of the world than Great Britain and the benefit of his actual experiences under all sorts of conditions will be of great benefit to the company, as he will be in a unique position to test motor accessories of every kind from the user's point of view. Mr. Edge will be prepared to test all really good devices that may be brought to his notice, but he has announced that the United Motor Industries, Ltd., must have goods of the highest grade and of real advantage to the user, not merely articles of attractive appearance for the purpose of creating sales.

—— ★ ——

The 1913 French Grand Prix will be held July 12 over a 19-mile course near Amiens, 80 miles north of Paris and between Paris and Dieppe, which will make it convenient for English visitors, it being possible to reach Amiens in 3.5 hours from London. The municipality, it is said, is paying $10,000 for the privilege of having the classic run in its vicinity. Such a subvention is needed because of the large expense attendant on promoting a Grand Prix race. It cost $60,000 last year, it is stated, and the promoters faced a large deficit after the contest had been run, and Georges Boillot in a Peugeot car had been declared the winner.

—— ★ ——

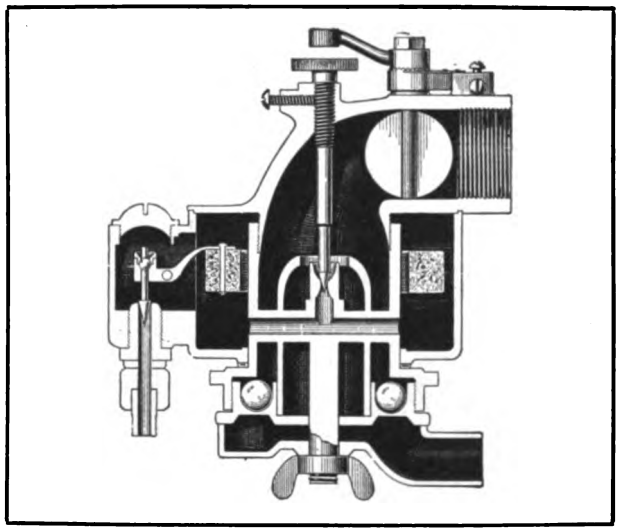
The few roads in existence in Venezuela until recently were used principally by heavy carts and were not well adapted to automobiles. The government, however, is now laying much stress on the improvement of existing ways and construction of new ones. The idea that the motor truck can be used to bring agricultural products to market is gaining favor and in a few years it is probable that there will be considerable mileage over which motor vehicles can be used to advantage.

—— ★ ——

It is expected that the new ruling by the United States credit department relating to automobilists crossing the Mexican and Canadian borders, the effect of which is that there shall be no duty charged on the cars, the only requirement being that the machines shall be inspected, will result in a great increase in the number of tourists visiting these countries. The new ruling fixes six months as the time limit on the free return of cars into the United States.

Digitized by Google

FEATURES OF PLANHARD CARBURETOR.



A CARBURETOR that presents interesting features in that the construction involves but few parts, and that there are no springs, levers or cams, is the improved Planhard made by the Planhard Manufacturing Company, 1784 Broadway, New York City, and Kokomo, Ind. It is of the concentric type, the float chamber surrounding the mixing chamber, and is designed in such manner that all joints are in a horizontal plane. A quality is that the vaporizer may be assembled by screwing the central member into the top member.

The problem of proper vaporization of gasoline and thoroughly mixing it with air to form a dry explosive gas, is held to be solved by the Planhard by its double concentric air and mixture tube construction. The fuel nozzle is in the centre and is entirely surrounded by the fixed or constant air tube. This is contracted at the upper end to form a venturi tube around the nozzle. Surrounding this tube, and between it and the float chamber wall is an annular opening through which auxiliary air is admitted. The construction is depicted in an accompanying illustration presenting a sectional view.

The maker holds that this is a most important feature in that the columns of mixture and auxiliary air always travel in the same direction and that the last named surround the mixture as it leaves the venturi tube, acting as an envelope to insulate the mixture from direct contact with the cold walls of the manifold. It is pointed out that condensation is prevented, that the surrounding envelope of pure air gradually unites with and thoroughly vaporizes the inner column of rich mixture, and that before it reaches the cylinder all free fuel is absorbed. This makes for a dry, rapid burning mixture and one preventing carbon deposits. Greater efficiency is claimed because of the more complete combustion.

The auxiliary air is admitted through a series of ball valves which are seated in holes in an adjustable screw plate at the bottom of the auxiliary air tube. These seats vary in size, but the bronze balls are all of the same size and weight and are lifted from their sets progressively as more air is required, the ball on the largest seat being raised first. It is held that fluttering is eliminated because the ball valves each lift a distance about equal to that of the lift of a single auxiliary air valve, and raising progressively, their total travel amounts to six or eight times that of a single valve for the same function. A uniform amount of air is admitted for varying engine speeds.

The spraying nozzle is cup shaped, and when the engine is inoperative, this fills automatically with gasoline to within a short distance of the top. This priming device makes for easy starting upon low grades of fuel and when the motor is cold. The float chamber is provided with a flooding device, also a vent. The air pan at the bottom of the carburetor is secured by a wing nut, which also serves for clamping the adjustable auxiliary ball plate, which is knurled on its periphery, so that the lift of the auxiliary ball valves may be adjusted quickly and easily, and

Sectional View of Improved Planhard Carburetor Employing Ball Valves for Controlling Auxiliary Air and Having Priming Device, Making for Easy Starting in Cold Weather.

the plate locked afterward by a wing nut. The Planhard carburetor is not only simply and sturdily constructed, but the maker claims that it will control the mixture of gasoline and air in any desired and unvarying proportions, making for greater efficiency from the motor, as well as economy of fuel.

The Hudson cars, made by the Hudson Motor Car Company, Detroit, are enjoying popularity with royalty. The machines have entered India in large numbers and are now used by five Maharajahs, as follows: Tikari, Chota Nagpur, Huthwa, Nowagar and the Newab of Bogra. Many high English officials are also riding in Hudson machines.

Function of Spiral Springs.

(1478)—To settle a debate in regard to the use of two spiral springs situated at the base of the steering gear tubing, one on the lead rod and the other on the throttle rod on a model T Ford, I would like to have your opinion as to the purpose of these two springs and the duties they perform. C. R. H.

Somerville, Mass., Jan. 28.

The members referred to are employed for preventing the movement of the levers except when desired by the driver, or in other words, the springs retain them in the position in which they are placed by the driver.

The spark and throttle levers are a part of the rod extending through the tubing housing to the steering column, being bent at the top to form the control members. Each lever has a tooth or sharp edge which meshes with similar teeth on the stationary ratchet plate affixed to the tube member.

At the bottom of each rod is placed the spring

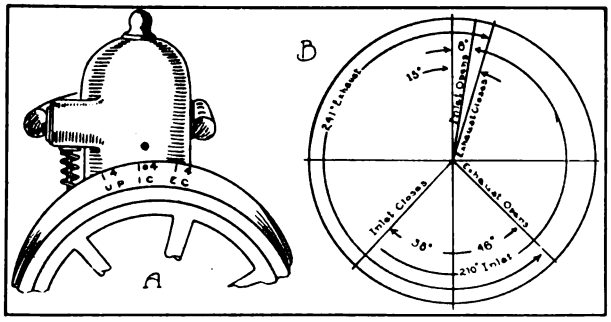

Fig. 1—Valve Timing with Unmarked Flywheel: A, Showing How Cylinder May Be Prick Punched and Flywheel Marked After Degrees Are Laid Out by Diagram Indicated at B.

referred to and its function is to restrict the upward movement of the rod, yet at the same time permit the lever to be moved over the teeth. The tension of the spring is sufficient to hold the lever in the position set. If these springs or a similar arrangement were not employed the lever would move freely, resulting in the increasing or decreasing of the lead or the opening and closing of the throttle when not desired.

The design has been employed by the maker of Ford cars for some time, it having been fitted to the early models, and it may be stated that it is distinctive of the Ford product. It rarely gives trouble and is easily operated and adjusted as to wear.

Back Firing in Carburetor.

(1479)—Will you please explain what causes back firing to the carburetor? What I would like to have explained is how does the gas become ignited. Does the mixture fire before entering the cylinder and go through the explosion and exhaust operation and then come back through the intake when open to take in the new charge of gas? I have been unable to find anyone who can explain how the ignited gas gets back to the carburetor or how it is ignited. F. N. S.

Elgin, Ill., Jan. 30.

The question was fully answered in the Jan. 10th issue of The Automobile Journal in this department.

Timing Splitdorf Magneto.

(1480)—I would like information upon timing and adjusting a Splitdorf magneto, also would like to know how to locate a short circuit which seems to be in the breaker box. J. JOHANSON.

Sioux City, Ia., Jan. 27.

Although the model and type of motor were not mentioned, the timing and adjustment of the Splitdorf magneto is practically the same. Assuming that the engine is a four-cylinder, four-cycle motor, it should be borne in mind that the armature shaft of the magneto must be driven at crankshaft speed and that the direction of the drive must be taken into consideration. The general practise is to drive or revolve the armature shaft in a right hand or clockwise direction, this being indicated on the instrument. Some models are so designed that the direction may be changed.

To change from one direction to the other, remove the breaker box, hold the driven end of the armature firmly with a pair of pliers and remove the small retaining or locking nut. Pull off the cam, which is keyed on with a Woodruff key, turn the cam over, replace the nut and reset it on the shaft with a prick punch so that it will not jar off. Then remove the distributor block and the screws from the lettered ring. Remove the brass protecting cup on the distributor bearings which will be found inside the inverted U formed by the magnets, and the top screw underneath in the centre of the distributor shaft. The distributor and its gear can then be pulled forward out of mesh. Next set distributor gear back into mesh so that the position of the segment will agree with A or C, Fig. 2.

After securing the magneto to its bracket or base on the motor, crank the engine until the piston of the first cylinder, that nearest the radia-

Digitized by Google

tor, completes the compression stroke and is on dead centre. Next retard the spark advance lever on the steering wheel to its limit and connect the actuating rods, etc., to the spark advance lever on the breaker box of the magneto. If the armature shaft revolves in a clockwise direction looking at the driving end, the lever should be in its topmost position. If the shaft rotates anti-clockwise, the lever should be at the bottom limit, and advanced upward.

Next revolve the armature shaft in its direction of rotation until the oval breaker cam comes in contact with the roller in the breaker bar and just begins to separate the platinum contact points. The points should begin to separate when the armature core leaves the pole pieces as shown in the sketch. It is important that the position of the bronze of the distributor be ascertained and this must be observed as indicated in the No. 3, the cup above the first member in the drawing is connected by cable with the third cylinder of the motor. The next contact to be made in rotation is the cup marked 4 as the fourth cylinder fires next. The second cylinder is the last to explode and to this is connected the wire leading from the cup marked 2. It should be borne in mind in making connections that while the distributor sector makes a complete circle the cylinders do not fire in 1, 2, 3, 4 order, but 1, 3, 4, 2. By following the wiring diagram one should not experience any difficulty in correctly installing the cables.

There is but little to be done to the instrument. If it becomes necessary to reset the contact points after considerable service, the locking nut is loosened and the screw adjusted so that the break is no more than .03125-inch. If pitted the points should be cleaned with a very fine file,

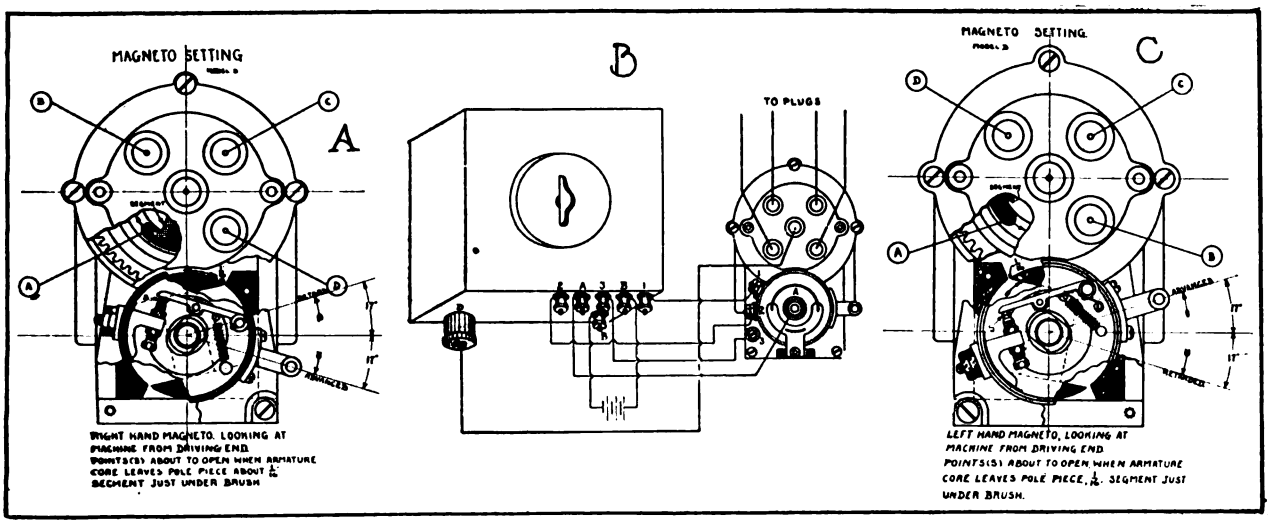

Fig. 2—Setting and Timing of Splitdorf Magneto: A, Diagram for Right Hand Direction; B, Wiring Plan of Vibrating Dash Type of Coil; C, Showing Proper Position of Armature When Driven Left Handed.

the drawing. It should also be borne in mind that the direction of rotation of the distributor is opposite to that of the armature shaft, as the distributor is mounted upon a great driven from another gear on the armature shaft.

The direction of rotation is necessary when connecting the high-tension cables from the cups to the spark plugs. The firing order of the motor must be known and as all four-cylinder engines fire either 1, 3, 4, 2 or 1, 2, 4, 3, it is an easy matter to watch the intake valves and determine the order of explosions.

Assume that the distributor sector is in contact with the No. 1 cable indicated in the wiring plan presented at Fig. 2, B, and the motor fires 1, 3, 4, 2: Here the distributor is rotating clockwise and as the next cylinder to explode is

taking care that the contacts are true.

Relative to the short circuit referred to, it may be caused in the breaker box by the presence of too much dirty lubricant. The member may require cleaning. Flooding of the parts with oil will breed trouble. Lubricate the little roller on the breaker bar about once a month by applying the oil sparingly with a toothpick.

To locate the short circuit the primary wiring should be examined very carefully. The writer recalls an instance of a driver whom he assisted on the road where the owner of the car in replacing the breaker box cover did not affix it securely and the woven wire brush did not make a good contact. It is important that this member make proper contact. Examine the wires leading to the breaker box and make sure that none

Digitized by Google

are frayed and have loose strands in contact with points other than incorporated on the breaker box.

Wiring Dual Ignition.

(1481)—Will you kindly give me the wiring plan of dual ignition, battery and magneto, on one set of plugs, and explain the operation of the system, also electric starting devices as installed on 1913 cars? A. G. W.

Boston, Mass., Jan. 23.

The wiring plan of a dual ignition system is presented at Fig. 2, B, which is for a model B Splitdorf magneto with vibrating type of transformer. The machine generates a low-tension current which is collected by brushes and led through the primary wire A to the transformer coil, and the circuit being broken at the proper instant a high voltage current is induced in the secondary winding of the coil. This high-tension current is conducted from the coil by the cable D to the central brush D of the distributor, whence it is delivered to the different cylinders in correct sequence. This distributor operates on the same principle as a distributor of the coil and battery system of ignition.

A dual system is provided by utilizing dry cells or a storage battery. The transformer is employed as a spark coil by employing the mechanism of the circuit breaker to interrupt the current from the battery, permitting the one set of plugs to be used. The distributor is utilized to deliver the current to the plugs as with the magneto system. It will be noted that one side or lead of the battery is not grounded, but both wires are led from the source of current to the coil member.

To explain the construction, operation and application of the various electric motor starting systems, as represented on the 1913 motor cars, would require considerable space. The subject will be taken up in detail in an early issue of The Automobile Journal and will be fully illustrated.

Valve Timing.

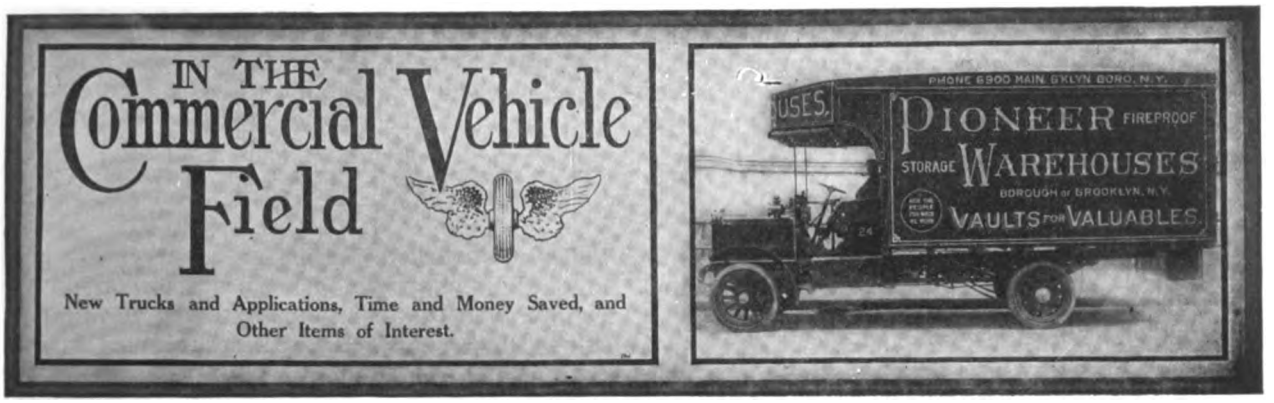
(1482)—I have an old car and in overhauling the motor removed the camshaft without marking the gears for remeshing and these were not marked at the factory. I wrote the maker for the timing plan and received it, but the flywheel is not marked with the valve openings and the plan sent me is for degrees. The diameter is 17 inches. How should I go about it to put back the camshaft? READER.

Louisville, Ky., Feb. 3.

To replace the camshaft and remesh the gears it should be borne in mind that having the timing order and the diameter of the flywheel the gears should be meshed so that the cam actuating the intake valve of the first cylinder should begin to move and lift the valve when the flywheel is rotated a certain number of degrees.

Assume that the motor is a four-cylinder unit and the valve timing is as follows: Intake opens eight degrees past upper dead centre and closes when it is 38 degrees past lower dead centre. The exhaust opens 46 degrees before the lower dead centre and closes 15 degrees past upper dead centre. This indicates that the inlet opens and closes late and that the exhaust opens early and closes late.

The flywheel being 17 inches in diameter it is a simple matter to lay out the degrees on its periphery or lay the latter out by inches. The figures will be as follows: Inlet valve opens late 1.1875 inches, closes late 5.65625. Exhaust valve opens early 6.84375 and closes late 2.234275. Top and lower dead centres are essential and these may be secured by turning the flywheel until the pistons of the first and fourth cylinders are at the top. Mark the flywheel for these positions and make a prick punch mark on the rear cylinder as indicated at Fig. 1, A.



Next measure off 1.1875 inches on the periphery of the flywheel to the right and the inlet valve opens late. Turn the flywheel to the left until the mark registers with that on the cylinder and replace camshaft, meshing the gears in such manner that the inlet valve of the first cylinder will begin to lift. After fitting the camshaft rotate the flywheel in the direction opposite to which it travels and then move it to the left to make sure that the inlet valve of the first cylinder starts to lift when the mark on the flywheel coincides with that in the cylinder.

The timing may be checked up for each valve to make sure the setting is correct by measuring off the distances on the flywheel and marking these with a prick punch. Assuming that the firing order of the motor is 1, 3, 4, 2, the marks on the flywheel will be as follows:

1-4,	I-O	.....inlet	valves	1 or 4 open
1-4,	I-C,	.....inlet	valves	1 or 4 close
1-4,	E-O	.....exhaust	valves	1 or 4 open
1-4,	E-C	.....exhaust	valves	1 or 4 close
2-3,	I-O	.....inlet	valves	2 or 3 open
2-3,	I-C	.....inlet	valves	2 or 3 close
2-3,	E-O	.....exhaust	valves	2 or 3 open
2-3,	E-C	.....exhaust	valves	2 or 3 close

The setting of each valve may be tested by rotating the flywheel in the normal direction until the mark on the flywheel for the inlet valve of the first cylinder registers with that on the cylinder and the balance of the valves are checked in a similar manner. If the valve lifting mechanism is adjustable, it can be changed to correspond with the marks on the flywheel.

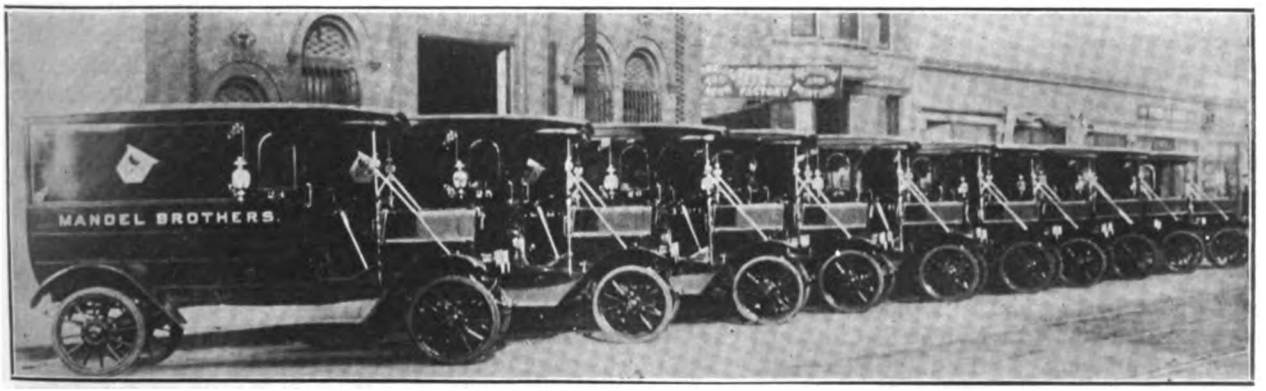
ELECTRICS IN DELIVERY SERVICE.

Two Prominent Concerns Replacing Horses with Waverley Half-Ton Wagons.

The adaptability of the electric wagon of the light delivery type for department store service has been demonstrated to the satisfaction of L. S. Ayres & Co., Indianapolis, Ind., which recently purchased seven Waverley electrics, made by the Waverley Company of that city. Six of these are of 1000 pounds capacity, while the seventh is rated at one ton. They will replace 12 single and one double horse wagons in local and suburban delivery work.

Before making the purchase the company made an exhaustive test of the new system. It was found that the average daily mileage was 35, with a maximum of 57. The average number of packages handled daily by each vehicle was 241, with a maximum of 462. The electric left the store at the usual time and returned much earlier than was possible with the horses. The cost of operation figured out as follows: Operating expense, including charging, washing, garaging, etc., $2 a day; fixed charges, including depreciation and interest, $1.30; driver's salary, $2.50.



Mandel Bros., Chicago, has been experimenting with both gasoline and electric vehicles for a number of years, and recently placed an order with the Waverley Company for 10 Waverleys of 1000 pounds capacity. Five of these wagons are equipped with batteries capable of giving 60 miles to a charge, and the others with batteries giving from 75 to 100 miles.

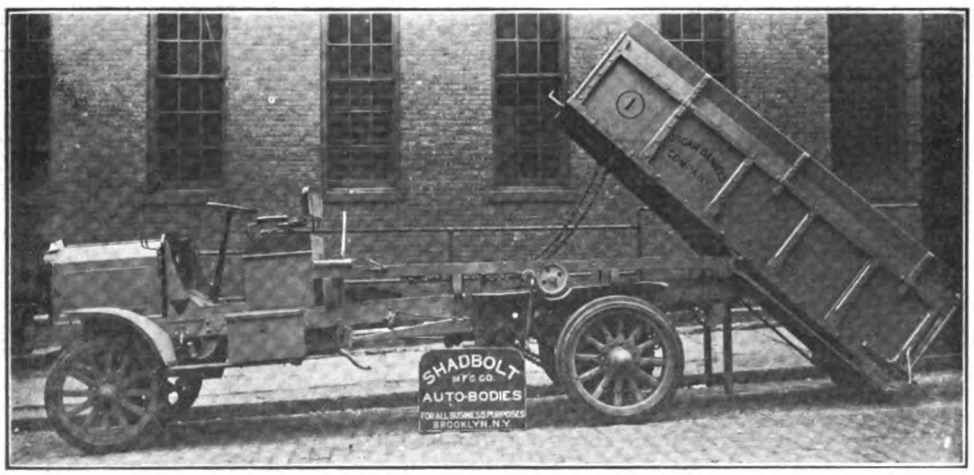
GOOD RECORD FOR WHITES.

Seven 'Buses Average 150 Miles a Day at Operating Expense of 4.5 Cents.

Sixty thousand miles have been covered by each of the seven White motor 'buses, made by the White Company, Cleveland, O., and operated by the Rapidtransit Motor Company of Indianapolis, Ind., during the past year. In summer and winter this fleet maintained its efficiency steadily despite a high average of 150 miles daily travel and an operative schedule of 17 hours each day. Without taking into account the item of overhead expense, the company found that the cost a mile was only 4.5 cents.

In winter, under extreme conditions, this figure was slightly increased, but the Whites were

Fleet of Waverley Electric Wagons Recently Added to the Delivery Equipment of Mandel Bros., Chicago.



Digitized by Google

able to maintain their schedule at times when the street car service was crippled by bad weather. The year's record shows an average of 10 miles to a gallon of gasoline and 300 miles to a gallon of oil. The officials of the company state that after a year's service three of the machines were overhauled and found to be as good as new, without any perceptible wear in the motor parts.

INTERESTING DUMPING BODY INSTALLATION.

WITH the more general adoption of the mechanical transport as a means of solving the haulage problem, there has been decided interest in the subject of body construction, particularly by those engaged in certain lines. Special reference is had here to the handling of coal, building materials, etc., and in such work it hardly will be denied that some form that will admit of quick unloading is most desirable, if the owner is to obtain the fullest measure of economy and efficiency from his equipment.

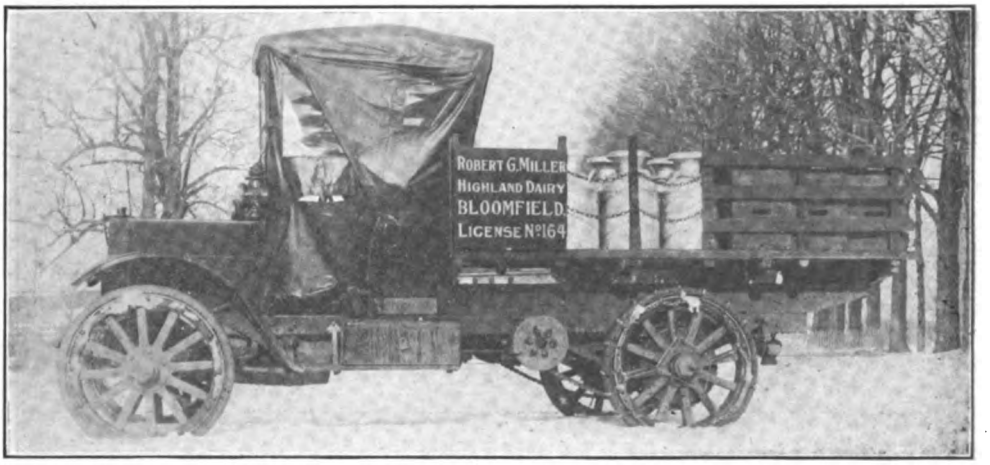
The Shadbolt Manufacturing Company, Brooklyn, N. Y., which has been engaged in the business of supplying bodies for horse vehicles for some years, has brought out a dumping body, constructed of wood, which is intended to minimize labor in this respect. An accompanying illustration shows the method of operation in a measure.

Shadbolt Rear End Dumping Body, Showing Winch and Chain for Unloading.

The body is mounted on a superstructure or frame that is clipped to the chassis side members, and there is a slight inclination to the bottom when ready for loading. On the sills at either side, under the rear portion, are heavy steel guides which take the ends of a stout rod extending through the side rails of the superstructure. These guides are formed at the forward ends to endure under heavy strain.

The body can be drawn forward or backward on the frame the length of the guides, chains being connected to a cross shaft carrying a gear at one end, into which meshes a pinion on the countershaft that can be operated by hand crank. When lowered the body is secured by a latch that also is operated by hand. To unload the latch is released and the body drawn back on the frame until just back of the centre of gravity, when it automatically tilts and the rear end falls until it rests upon the ground. By reversing the movement of the hand crank, the body is drawn back on the frame and automatically takes its position.

The construction is with heavy wood frame, panels and floor. The size is varied according to requirements, and often it is possible to increase the carrying capacity by the use of flare boards. The tail gate is designed so that it may be opened at the top or bottom, or it may be removed if desired. The company also makes a number of other body types, including those for discharging at the side. A semi-trailer is another specialty, one of the types being with capacity of 10 tons of stone, sand, etc., for use with a five-ton truck, for example, while another is designed for the handling of lumber. The engineering department is now at work upon a detachable body which is expected to meet with decided favor by lumber men.



The Animal Rescue League of Pittsburg, Penn., which some time ago put into operation an automobile dog ambulance of two tons capacity, made by the Lange Motor Truck Company of that city, has given an order for a second machine of the same design. The machine is divided into 34 compartments, preventing well dogs from mingling with diseased ones.

ECONOMICAL HAULAGE IN DAIRY BUSINESS.

THAT there is ample reason for the purchase of a motor truck for the delivery of milk in the East is the opinion of Robert G. Miller, proprietor of the Highland Dairy, Bloomfield, Conn. He began experimentation about two years ago, and while the first machine was a small one, equipped with pneumatic tires, he found it so valuable in his work that he expresses the situation as follows: "It was a case of buy a motor truck or go out of business."

The present car is a one-ton Federal, made by the Federal Motor Truck Company, Detroit, and he has driven it some 7000 miles. The farm comprises 225 acres, and 10 horses are employed upon it. The dairy is about 6.5 miles from the market in Hartford, and the route is for the most part over good roads with few hills. The average daily mileage made by the truck is 25. It leaves the dairy at 7 in the morning and returns at noon, while with horses it was necessary to leave home at 4 in the morning and begin peddling milk in Hartford at 5 in order to have the afternoon for other farm work.

Federal One-Ton Truck Which Does Work of Four Horses at a Substantial Daily Saving.

Mr. Miller has kept careful record of the cost of operating the machine, and finds this to be as follows: Gasoline and oil, 90 cents a day, $328.50; tires at one cent a mile, $120; depreciation, $6000; interest at 6 per cent., $117; insurance, $111, making an annual total of $1276.50. This gives the daily cost as about $3.50. Inasmuch as the first cost of the truck was $1950, the annual depreciation of $600 is about 30.6 per cent.

Mr. Miller states that to do the same work with horses he would need four. Feed would cost 80 cents a day, or $3.20 for the four. Two horses would be used each day, resting the alternate day. From these figures it can be seen that the economy effected by the truck is decidedly material.

In addition to caring for the milk route, the truck is utilized to advantage in other work during the afternoon. Last summer Mr. Miller oiled 32 miles of road in the towns of Bloomfield and Granby. Transportation work of the usual character in connection with a farm of such proportions is done by the Federal whenever occasion demands.

KISSELKARS IN ST. PAUL.

Thirty of These Are Replacing 145 Horses with Slight Increase in Investment.

The Kissel Motor Car Company, Hartford, Wis., finds there are 30 of its KisselKar trucks in service in St. Paul, Minn., these ranging in capacity from 1500 pounds to three tons, no four or five-ton machines having been sold in that city. These have replaced 145 delivery horses and cover an aggregate daily mileage of 1566, making 3537 deliveries.

The most significant feature of the case and the most gratifying from the standpoint of the truckman, is the comparative average of initial investment. The trucks, including several that were specially designed, represent a total cost of $65,600. The horses replaced, including wagons, harness, etc., represented an investment of $62,-150. This slight difference in first cost taken in connection with the ability of the motor vehicles to more than double their present mileage if worked a sufficient number of hours, offers food for thought.

H. H. Lundahl, Walnut Grove, Minn., has used a Reo truck for over a year in hauling milk without repair cost.

MORELAND FOR HONDURAS.

Truck Utilizing Distillate for Fuel Will Carry Mails to Capital City.

H. E. Dean, who has the contract for carrying mail for the government of Honduras, Central America, has purchased a Moreland distillate truck, made by the Moreland Motor Truck Company, Los Angeles, Cal. It will run between Tegucigalpa, the capital of Honduras, located in the interior, and Amapala, on the sea coast, a distance of 115 miles. It is at present the only motor driven apparatus in the country and the road to be covered also is the only good highway in the territory.

Mr. Dean plans to make the round trip in two days, thus giving Tegucigalpa three mails a week, instead of one as has been the case with slow moving horse teams. Passengers will be carried, the truck being covered with canvas as a protection from rain

One of a Fleet of 1.5-Ton Whites Recently Ordered by Wells Fargo Express Company.

WILL REPLACE HORSES.

Newark Coal Dealer Well Pleased with His Five-Ton Pope-Hartford Dumper.

Among the recent motor truck installations to attract attention is that of a Pope-Hartford five-ton chassis equipped with a self-discharging coal body, delivered to Joseph H. Lucking of Newark, N. J. The vehicle has a capacity of six tons and has been delivering from 45 to 50 tons of coal daily at an average haul of five miles a load. The truck far exceeded the expectations of Mr. Lucking, who has ordered a three-ton vehicle of similar design, with the intention of disposing of his horses as quickly as he can replace them with motor equipment.

Delivery is made from the right side. The body is elevated and the coal is discharged in about two minutes. The machine was made by the Pope Manufacturing Company, Hartford, Conn.

WHITES FOR EXPRESS WORK.

Wells Fargo Company in San Francisco Receives First Machine on Recent Order.

An accompanying illustration presents the White 1.5-ton truck, made by the White Company, Cleveland, O., which is the first to be delivered to the Wells Fargo Express Company, San Francisco, Cal., on an order for four of these cars. Inasmuch as the express companies of the country have been experimenting with several types of vehicles before making decision in the matter of ordering in quantities, it must be accepted as demonstrated that the White trucks are able to satisfy the requirements of this concern in this particular field.

The body is specially designed for the work it is to perform, being fitted with an extension top to provide for carrying larger loads should occasion require. The location of the package compartment is with particular reference to weight distribution. The pneumatic tires, single in front and dual in the rear, are stock equipment on this size of White cars.

Stewart motor trucks, made by the Stewart Motor Corporation, Buffalo, N. Y., are now used as far north as Edmonton, Alberta, Canada, and as far south as Buenos Aires. Pratt & Co. of the latter is handling Stewart trucks for Argentine, the first shipment to that country having been made recently.

KISSELKARS FOR FIRE DUTY.

Two Pieces Added to the Equipment of the Department in Quincy, Mass.

The fire department in Quincy, Mass., has just added to its equipment a new KisselKar combination chemical engine and hose wagon and a KisselKar chief's car, made by the Kissel Motor Car Company, Hartford, Wis. The chief's machine formerly was a touring car used for demonstration purposes by the Kissel company. The rear seat was displaced by a 25-gallon chemical tank and other appointments were added to make it conform to the requirements of its new service, including 150 feet of chemical hose, axes, crowbars, etc.

The combination wagon is of special design, in that it is somewhat larger than the original vehicle purchased by this city. It carries two chemical tanks, 200 feet of chemical hose, 1000 feet of regulation fire hose, second-story and roof ladders, axes, crowbars and the other usual fire fighting appliances. The engines of both cars are six-cylinder units of 60 horsepower. On a recent test the combination vehicle, fully equipped and carrying in addition 21 men, climbed the steepest hills in the city with ease.

KisselKar Combination Fire Wagon Recently Placed in Service in Quincy, Mass.

OPERATES LARGE FLEET.

New Haven Concern Does Extensive Trucking Business in New England States.

The Smedley Company, New Haven, Conn., one of the largest trucking concerns in that state, now has a fleet of 15 motor trucks covering New England. Not only has the company been able to handle goods much more quickly than formerly, but has increased its business decidedly, according to Harry Smedley, one of the proprietors.

Included in this fleet are three Alcos of two, 3.5 and six tons each, made by the American Locomotive Company, Providence, R. I.; one 3.5-ton Kelly, built by the Kelly-Springfield Motor Truck Company, Springfield, O., and two G. V. electrics, produced by the General Vehicle Company, Long Island City, N. Y. These machines are constantly on the road between New Haven, Boston and New York, and have been chosen in many instances by persons desiring to escape the disadvantages of moving furniture and merchandise by railroad freight cars.

TRUCK RELIABILITY RUN.

American Automobile Association Is Asked to Arrange for a Contest This Summer.

Agitation which it was said originated at Detroit for an annual national reliability event for motor trucks, received notice formally at the recent meeting of the executive committee of the American Automobile Association in New York City. The question came up in the form of a resolution, which was adopted, authorizing the president to appoint a committee to discuss the matter with the National Association of Automobile Manufacturers, and if sufficient support in the form of a representative entry list is forthcoming, the president is further empowered to appoint a committee and otherwise arrange for such an event during the coming summer.

What form of contest will be recommended was not made known, but William E. Metzger, a member of the A. A. A. executive committee and president of the N. A. A. M., favored the application which was made for a national non-stop run to be conducted at Detroit at the time of the Michigan state fair, with an open air motor truck exhibition to be held on the state fair grounds.

GOVERNOR SIGNS ONE BILL.

Violation of Motor Vehicle Law in New York State Is Now a Misdemeanor.

The bill providing for the punishment of intoxicated drivers and intended to remedy a defect in the so-called Callan law in New York State has passed the legislature and has been signed by Gov. Sulzer. It makes a violation of any of the provisions of the motor vehicle law a misdemeanor, punishable by a fine of not more than $500 or a year's imprisonment, or both.

Assemblyman Farrell has introduced a bill which raises the minimum age of operators of motor cars from 18 to 21 years and provides the annual fee for the license renewal shall be $1 instead of $2. It makes the renewal of the license mandatory, unless the person has been convicted for violation of law, and this provision will be contested by the secretary of state's office, which has refused to issue licenses for sufficient reasons. Instances have been shown where chauffeurs have indirectly participated in crime, and yet escaped conviction on technicalities and the license bureau desires the privilege of refusing license to this class of offenders.

LEGISLATION IN JERSEY.

Proposed Amendments Affecting Provisions of Recently Enacted Reciprocity Measure.

Drastic legislation is promised at the present session of the New Jersey legislature, particularly with reference to the so-called reciprocity law enacted last year. It is declared that the 15-day tourist privilege is abused and no way has been found to remedy conditions. Bills have been introduced to repeal the reciprocity law and another proposed measure authorizes the governor to appoint three commissioners to meet with similar commissioners to be named by other states of the Atlantic seaboard to consider plans and suggestions for uniform automobile legislation. It is believed that by this plan real reciprocity can be obtained.

A series of bills, which have the indorsement of State Motor Vehicle Commissioner Lippincott, looking to a number of changes in the existing laws, has been introduced by President Fielder, which provide as follows: Raising the age limit for drivers' licenses from 16 to 18 years, increasing the license fees, changing the method of rating the power of machines, increasing the number of inspectors from 10 to 16, changing the method of carrying license plates, placing a red light at the rear, visible at least 50 feet, and making possible a penalty of $100 fine for failure to obey the summons of a motor vehicle inspector.

INTERESTING FRENCH DECISION.

Court Holds Automobile Manufacturer Is Liable for Damages in Certain Instances.

A case of exceptional interest to automobile makers and chauffeurs has been decided by the Paris court of appeal. As reported on this side, the court in effect ruled that automobile manufacturers are responsible for accidents arising from the faulty construction of the steering wheel and steering gear of automobiles and that the driver can be held responsible only for proper lubrication. The judgment was delivered in connection with an appeal arising out of a claim for damages by Mr. Strawbridge of Philadelphia, Penn., who met with an accident six years ago while touring in the Pyrenees with his wife and family governess, which resulted in the amputation of both his legs.

He subsequently brought an action for $100,-

Digitized by Google

000 damages against the Societe Routiere, from which he had hired the automobile at the rate of $35 a day. That company denied any liability and maintained that the responsibility devolved upon the manufacturer from whom it bought the machine. In the first instance the court awarded Mr. Strawbridge $14,000 damages and held the manufacturer was not responsible on the ground that it was the driver's duty to constantly supervise the steering gear. This decision has now been amended by the court of appeal, which holds that the automobile maker is liable for any constructional defect and that, in fact, the chauffeur, who is not an engineer, must rely solely upon the proper initial construction of his automobile. The manufacturer of the automobile in question and not the Societe Routiere, was ordered to pay the $14,000 damages to Mr. Strawbridge.

SEEK UNIFORM REGULATIONS.

California Motorists Particularly Active with Reference to Matter of Speed Limits.

A troublesome problem to the automobilists of California is the large number of conflicting laws in relation to the speed limit, etc. The Automobile Club of Southern California has taken the matter in hand and its legislative committee has plans for the drafting of a law which will be presented to the legislature for enactment.

There are many good motoring laws in California, but they are county and not state laws. Thus the law in one county will be found to differ widely from that in an adjoining county, so that motorists, especially strangers, are constantly violating the law unconsciously. For instance, in one town the speed limit will be 12 miles an hour, while in the next it will be found to be 20 and in the next beyond that possibly five miles is the limit, thus causing a bewildering confusion. The plan is for state wide legislation to remove this condition and thus far a majority of county officials and citizens favor the change.

WOULD TRANSFER AUTHORITY.

Bill Makes Its Appearance in California Providing for New Licensing Methods.

The highway commission of California is endeavoring to obtain the passage of a law providing for the relicensing of all the automobiles of California and the transfer of the motor vehicle department from the state to the highway department. The purpose of the proposed change is to make the license revenue directly applicable to road maintenance.

Secretary of State Jordan is bitterly opposed to the legislation and declares it not so much in the interest of the state as of patronage. The motor vehicle department now employs two men, he states, while under the proposed act it would require 15 persons to operate it under the highway department. He threatens to take the matter before the people on a referendum vote if the law passes.

AMENDED TRUCK BILL.

Massachusetts Legislature Will Take Up Matter of Limiting Their Weight.

Many important changes in the laws governing the operation of automobiles in Massachusetts are recommended in the annual report of the state highway commission. The report cites the increase in use of motor trucks and states the commission's belief that the law should limit the weight and speed of such vehicles. "Motor trucks and commercial vehicles now travel long distances," says the report, "and the commissioner feels that it is only fair that the same fee should be charged for their registration as for automobiles of like horsepower."

It is understood that the proposed bill limiting the weight of vehicles which may utilize the highways of Massachusetts without a special permit will come before the legislature again this year in amended form. As originally introduced the weight of the vehicle and load was fixed at a maximum of six tons, which is held to be the legal limit in that commonwealth, although the existing law is admittedly a dead letter. The amendments are the result of the hearings which were held a year ago and provide a maximum weight of 12 tons, graduated as to weight permitted for each inch of tire width. Speed limits are also to be set, approximately as follows: Trucks of four tons weight, 15 miles an hour; six tons and over on rubber tires, 12 miles, and six tons and over on metal tires, six miles. The highway commission recommends, in view of the increasing number of automobiles, an absolute maximum speed limit, say of 25 miles an hour.

A bill introduced in the Maine legislature provides that the town of Eden, in which is located Bar Harbor, the famous summer resort, at any legal meeting of the voters may open to the use of automobiles and motor vehicles any of the public highways within its limits.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

While there can be little doubt that the progress of development in the field of aviation was decidedly marked during 1912, the situation with reference to world's records did not receive the same consideration as in previous years. The efforts of constructors and pilots was along somewhat different lines, and although the hydraeroplane made its first appearance in 1911, much attention was paid to this newer branch of the industry last year.

An acompanying table sets forth the changes in world's records, the marks being unofficial in a measure, since the Federation Aeronautique Internationale has not yet made its report for the year. It will be noted that in some instances there has been no new record during 1912, and this applies to at least three items, which otherwise should be included in the tabulation.

The records for an aviator and two passengers, speed according to distance, are still held to the credit of the late Edouard Nieuport, who created the following marks with a 50 horsepower Nieuport monoplane at Mourmelon, France, March 9, 1911: 10 kilometers, 6:00; 20, 11:59.4; 30, 17:52.6; 40, 22:44.4; 50, 29:37.4; 100, 59:08.

Guillaume Busson, flying a 100 horsepower Deperdussin monoplane at Rheims, France, March 10, 1911, created the following records for an aviator and three passengers, speed according to distance: Ten kilometers, 6:16.6; 20, 12:34.2; 30, 18:48; 40, 25:05.6; 50, 31:23.2. The same day and with the same machine he also secured the following records for an aviator and four passengers, speed according to distance: Five kilometers, 3:34; 10, 7:08; 20, 14:00.6. These still remain without change.

Some new records have been established since the first of the year. That for greatest duration without alighting for an aviator and four passengers is now held by Arthur Faller with an Aviatik biplane, who flew at Mulhausen, Germany, 1:18:00, Jan. 3. The same day he flew with five passengers, 1:06:05; with six, 1:00:00, and with seven, 6:49.

At Buc, France, Jan. 10, Maurice Chevillard

Machines Lined Up in Front of Sloane Aviation School on Long Island: Left to Right, 45 Horsepower Caudron, 60 Horsepower Passenger Deperdussin, School Deperdussin, School Blerlot, Curtis Type Biplane.

Digitized by Google

with an Henri Farman biplane flew to an altitude of 4921 feet, creating a new altitude record for an aviator and three passengers. At Milan, Italy, Jan. 24, Slavorossoff (name of machine unknown) created new records for an aviator and one passenger, speed according to distance, as

been received in this country at this writing.

Perhaps one of the most interesting flights of the new year was that of Jean Bielovuccie, a Peruvian aviator, who successfully accomplished the flight over the Alps into Italy by way of the

*Biplane, all others monoplane; †mark for 1911, record was not exceeded in 1912.

follows: Two hundred kilometers, 1:56:30; 250, 2:24:30.

Jules Vedrines with a Deperdussin monoplane claims to have exceeded the records for 250 and 300 kilometers while flying at Etampes, France, Jan. 9. He landed heavily at the end of 300 kilometers, and no definite figures for the flight have

Simplon pass, from Brig to Domodossola, Jan. 25. It will be remembered that this was the task in which Georges Chavez, also a Peruvian aviator, lost his life, Sept. 27, 1910.

Bielovuccie utilized an Hanroit monoplane and had been waiting since Jan. 8 for favorable weather. He made his first attempt Jan. 14, but

Digitized by Google

after reaching an altitude of 6000 feet was forced to return to Brig on account of the wind. The successful flight was accomplished in 25 minutes.

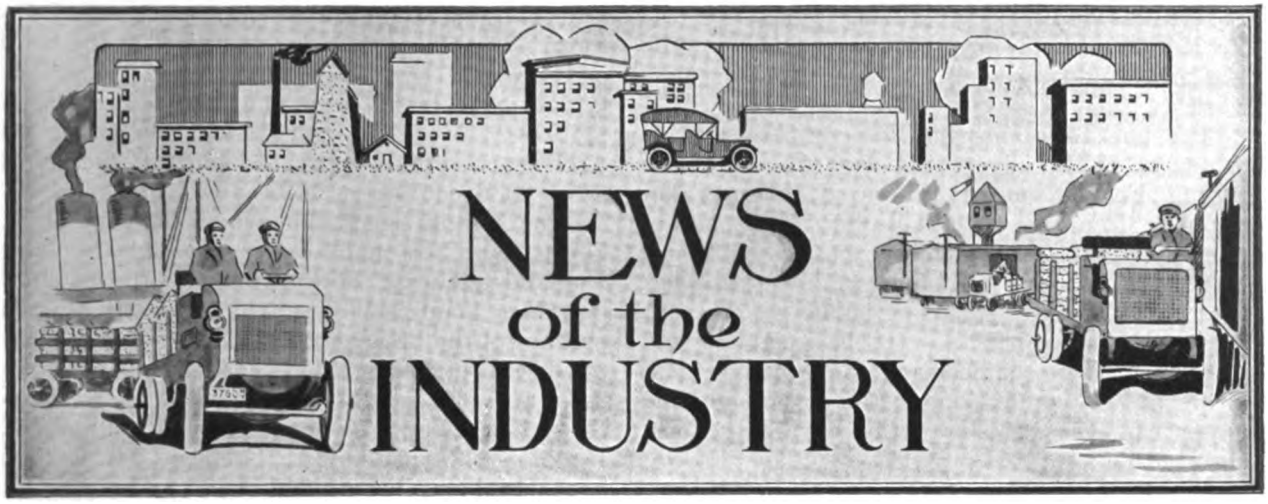
Bielovuccie is not yet 24 years old. He first came into prominence in August, 1910, when he encircled the Eiffel tower. In September of the same year he flew 335 miles across country from Paris to Bordeaux, by way of Orleans, Poitiers and Angouleme. At that time he was flying a Voisin biplane.

In view of the contemplated flights across the Atlantic during the present year, the performance of Roland G. Garros of France in flying his Morane-Saulnier monoplane from Tunis in Africa to Rome, Italy, in December, is of decided interest. The total distance covered was 515 miles, approximately 335 of which were over water. The

Type of Hanriot Monoplane Utilized by Jean Bielovuccie in His Recent Flight Over the Alps into Italy.

first stage was from Tunis to Trapani, Sicily, across the Mediterranean, 160 miles. After a delay of three days making necessary adjustments to the machine, Garros flew across the Tyrrhenian sea to St. Eufemia, Italy, 175 miles. The remainder of the distance to Rome was over land, 180 miles, with a stop at Naples.

Jan. 24, M. Bider, a French aviator, flew over the Pyrenees, from Pau, France, to Madrid, Spain. The only stop in the 317 miles was at Guadalajara, where the fuel tanks were replenished. The flying time was 5:35:00, and the weather was very bad, rain falling throughout the entire journey.



It is understood that the Burgess Company & Curtis, Marblehead, Mass., maker of Burgess-Wright biplanes and Burgess-Curtis hydraeroplanes, is working on a new flying boat which will be tested by the United States navy some time this month. From such announcement as has been made public it would appear that this will be the first machine in America to incorporate the Doutre stabilizer, which is said to have undergone decidedly satisfactory tests in France. The object of the device is to present automatic stability so far as possible.

Brig.-Gen. James Allen, chief signal officer of the United States Army, has announced the requirements for the new military aeroplanes, three of which will be purchased before July 1. They must be capable of flying at from 38 to 55 miles an hour, carrying two persons, ascending to an altitude of 2000 feet in 10 minutes carrying a live load of 450 pounds, and sustaining a continuous flight of four hours. An innovation is an enclosed protective body, composed of chrome steel at least .075 inch in thickness, which shall be subject to a penetration test for small arms fire under the conditions prescribed by the War Department. The machine also must carry a radio apparatus and other aerial instruments.

The power plant may be designated by the chief signal officer, this provision being inserted in case it is desired to adopt a foreign motor. A muffler for the engine and a stabilizer are regarded as desirable, but are not required by the army specifications. In addition to the wireless outfit, which is expected to weigh about 75 pounds, provision must be made for carrying a tachometer, compass, aneroid barometer, barograph, map holder, pad and pencil holder, clock and indicator of angle of incidence. The machine must be capable of being transported by road, in which event it must not exceed 10 feet in width. The construction must be such that it can be assembled for flight within one hour by six men.

Jacques Schneider of France, through the Aero Club de France, has offered $20,000 with which to found an international hydraeroplane prize. This will take the form of a work of art valued at $5000, accompanied by three annual cash awards of $5000 each. The conditions of the award will be announced by the club soon.

PEERLESS' EXPANSION PLANS.

With Additional Capital and New Stockholders Decided Growth Is Anticipated.

The Peerless Motor Car Company, Cleveland, O., which has been successful in producing and marketing Peerless pleasure cars and trucks under a comparatively moderate capitalization, is making elaborate plans to do business on a larger scale during 1913. It has raised its authorized capital stock from $3,000,000 to $10,000,000. Several new stockholders of wealth and influence have entered the company, while others have largely increased their holdings. While the pleasure car will in no wise be neglected, much more energy and capital than heretofore, it is understood, will be applied to the advancement of the commercial vehicle line.

The Peerless company has resolved to pay a dividend of 40 per cent. to its stockholders, payable out of the surplus of the common stock of the company. It has also offered the stockholders the right to exchange one-half of their holdings for an equal amount of preferred stock. A majority has announced its intention to make the exchange. The increase in capital stock is designed to carry out the development plans of the officers who have subscribed so liberally to the new stock and of the new interests working in complete harmony.

The new stockholders are known to have been successful in kindred fields and the automobile manufacturing company will be a large gainer in 1913 by their determination to take personal interest as members of the board of directors. These men are: F. S. Terry, H. A. Tremaine, B. G. Tremaine, J. B. Crouse and J. Robert Crouse. The Peerless company started the new year with a paid-in capital stock of $4,300,000 and assets, after deducting all liabilities of every kind, of between $5,000,000 and $6,000,000, exclusive of patents, trade marks and good will.

ACKERMAN IS PRESIDENT.

Prominent Detroit Accessory Maker Starts New Year Under Satisfactory Auspices.

Joseph N. Smith & Co., Detroit, maker of automobile accessories, recently held its annual meeting, when E. L. Ackerman was elected president and general manager, C. E. Chamberlin, the former president, having retired. The other officers are: Vice president and factory manager, James Shand; secretary and treasurer, C. E. Blaesser.

No change was made in the directorate of the concern, the following being reappointed: Chairman, E. L. Ackerman; C. E. Chamberlin, James Shand, C. E. Blaesser and William Lemmer, Sr. While the output of this progressive concern during the past year exceeded any previous record, its current contracts indicate that the coming year will show even greater advances.

LEAVES REO TRUCK COMPANY.

C. E. Easton Joins Gleeson Murphy in New Detroit Advertising Agency.

Charles E. Easton, formerly sales manager of the Reo Motor Truck Company, Lansing, Mich., has resigned his position to join the Detroit staff of the H. K. McCann Company, advertising agency, of which Gleeson Murphy, formerly with the General Motors Company, is the head. Mr.

Digitized by Google

Easton has acted as advertising director of the Reo concern for the past two years and joins the McCann company well equipped for his new work.

Previous to joining the Reo company he was in charge of the advertising departments of the Buffalo Forge Company and E. R. Thomas Automobile Company, both of Buffalo, N. Y., and of the Inter-State Automobile Company, Muncie, Ind. Mr. Easton is a graduate engineer who has made a study of advertising along several different lines of business. He has planned and handled both mechanical and sales management in his various connections in the automobile and motor car accessory industries during the past eight years.

LEAVES AUTOMOBILE INDUSTRY.

F. E. Dayton Resigns After Long Record with the Manufacturer of Columbia Cars.

F. E. Dayton, who has been sales manager of the Columbia Motor Car Company, Hartford, Conn., maker of Columbia cars, for about 10 years, or since the time of the Electric Vehicle Company, has resigned coincidentally with the announcement of his appointment as general manager of the National Incinerator Company, with executive offices at New York City, a foundry at Albany, N. Y., and erecting plants all over the country.

Mr. Dayton is one of the oldest men in point of continuous service with one line in the industry, having been successfully branch manager of the Electric Vehicle Company, original builder of Columbia cars, at Hartford, Boston and Chicago. He was connected with the firm since 1903 and was invited to continue with the reorganized United States Motor Company. He began his new duties Feb. 1.

NEW OIL CONCERN.

Invader Oil Company Acquires Business Heretofore Conducted by Chas. F. Kellom & Co.

The entire business and good will of Chas. F. Kellom & Co., Philadelphia, Penn., maker of Invader oil, has been acquired by a new corporation to be known as the Invader Oil Company. T. E. Tomlinson, one of the first men to study deeply the development of special oils for automobile use, will be vice president and general manager of the new concern. Charles F. Kellom will be president and the Kellom manufacturing and selling organization will remain intact. H. Dunthorn will be secretary and treasurer of the company, which has been incorporated under the laws of New Jersey with an authorized capital of $250,000. While the factory will remain at 113 Arch street, Philadelphia, the general offices will be at 80 Broad street, New York City.

The Kellom sales staff, which includes D. A. Scheu, who for many years covered the New England territory, will be retained, and in addition Mr. Tomlinson has associated with him a number of the better known men who were identified with him in previous enterprises. Among them are: H. Dunthorn, J. T. Rose, A. A. Francesconi, Howard Plowman, Harvey Wilkins, E. Kalkhof, F. Menke and A. Rafelson. Mr. Kellom began business in 1881 and claims to be the first to introduce light oil for use in automobiles, and has seen it come into general use, despite the suspicion which attended his action. Mr. Tomlinson first engaged in the oil business several years ago and created the famous Havoline oil, with which he became known nationally. He later organized the Wolverine Lubricants Company, which he built to large proportions.

BUYS FISK RUBBER STOCK.

John N. Willys Purchases Interest in Tire Company Which Seeks Massachusetts Charter.

It is announced that John N. Willys, president of the Willys-Overland Company, Toledo, O., maker of Overland cars, who controls an interest in several pleasure and commercial vehicle concerns, has purchased an interest in the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires. It is also stated that Mr. Willys' purchase is merely in the nature of an investment in a substantial firm, and he will not become an officer or director of the company, taking no active part in its management.

Harry T. Dunn, president of the Fisk Rubber Company, in discussing the report, stated that he and Harry G. Fisk, secretary-treasurer, will materially increase their holdings and will remain in full charge of the company, which will continue to retain its individuality. It is further stated that the Fisk Rubber Company is a Delaware corporation, but a Massachusetts corporation is in process of formation and practically completed, with an authorized capital of $15,000,000, of which $5,000,000 is first preferred stock, $3,000,000 of which will be issued; $2,000,000 second preferred and $8,000,000 common.

This Massachusetts corporation will acquire

Digitized by Google

all of the assets of the Delaware concern in the immediate future. The Massachusetts Fisk Rubber Company's active management will be identical with the present management of the Delaware company.

REFEREE WILL HOLD SALE.

Property of the Niagara Lead & Battery Company to Be Offered at Auction.

Notice has been given to the creditors of the Niagara Lead & Battery Company, Niagara Falls, N. Y., which is now in bankruptcy, that the property will be offered for sale at auction Feb. 25. The property includes the brick factory and land, also engines, boilers, machinery and apparatus of all kinds within the factory, all of which is subject to a mortgage held by the Niagara Falls Power Company.

The sale will be made subject to the lien on said mortgage by the power company. All of the property will first be offered for sale by parcel and then by bulk and the bid which realizes the largest amount therefor will be accepted by the trustee. If a bid made in good faith and for cash, amounting to $3000, is received, the property will be struck off to the highest bidder, but if no bid is made subject to the encumbrances, such as liens and mortgage, the entire property will be offered free of all encumbrances, the lien of the mortgage to be attached to the funds realized and the validity of the lien then to be determined by the court. The sale will be made subject to the confirmation of the referee.

BRISCOE FRERES ORGANIZED.

Former Head of United States Motor Company Forms New Concern at Billancourt, France.

Benjamin Briscoe, formerly president of the United States Motor Company, has opened an automobile factory at Billancourt, France, the home of the Renault and in the heart of the French automobile manufacturing district. The company is registered under the name of Briscoe Freres.

It is understood that this factory is at work on the production of a new car to be placed on the American market in ample time for the 1914 season. It is claimed that the new machine will be a five-passenger vehicle to sell at less than $1000. When the car is completed it is said that it will be manufactured at Detroit and that an assembly plant will be erected in England for supplying the European market.

NEW R-C-H MANAGER.

Something About the Man Who Has Been Selected to Head Well Known Concern.

It was announced some few weeks since that Peyton R. Janney would soon become general manager of the R-C-H Corporation, Detroit, maker of R-C-H cars. The story of his rise from machinist's apprentice to his present position is one which has few counterparts outside of the automobile industry. In other words, Mr. Janney is one of those men to whom the title of self-made may be applied with much truth.

When he was 10 years of age he entered the agricultural implement business as a machinist's apprentice, and he worked his way to the position of superintendent when most boys are just beginning to think of their life work. His knowledge of automobile affairs has been gathered during 12 years of connection with the industry. Mr. Janney has been in every division of the trade, retail sales as well as factory sales and production. For two years before joining the R-C-H forces he was associated with the General Motors Company as manager of various truck and pleasure car companies subsidiary to that concern.

Peyton R. Janney, General Manager, R-C-H Corporation.

He is a big man physically, as well as in a business way, for standing over six feet tall, he weighs more than 220 pounds.

ADDITION TO PILOT PLANT.

Increased Demand for Product Makes Necessary Securing Large Addition at Once.

The construction of a large addition to the plant of the Pilot Motor Car Company, Richmond, Ind., maker of Pilot cars, has been started

Digitized by Google

and the company will soon be in a position to add to its production in a substantial manner. The new building will be two stories high and will face the P. C. C. & St. L. railroad station.

Large sales of the concern demanded that the capacity of the factory be increased, and according to President George Seidel of the Pilot company, its size will be trebled. Because of the immediate need for the new building a force will be maintained large enough to complete the work within 40 days.

TWO NEW FIRESTONE MEN.

Bates Heads Pneumatic Tire Sales and Harris Joins Advertising Force.

The Firestone Tire & Rubber Company, Akron, O., announces the appointment of two new men to important places in its official family. George J. Bates has assumed charge of the sales in the pneumatic tire department and Roy C. Harris becomes assistant advertising manager. Both will reside in Akron.

George J. Bates, Sales Manager, Firestone Tire & Rubber Company.

Mr. Bates has a wide circle of friends in the industry, having been connected with the production and sale of tires for a long period. He goes to the Firestone company from the Diamond Rubber Company of Akron, with which concern he has been a department manager for the past five years.

Mr. Harris has been in charge of sales and publicity for the Vreeland Chemical Company of New York City for the past three years, and previous to that connection he was with the Crasselli Chemical Company of Cleveland, O. Although not quite as well known in the industry as Mr. Bates, Mr. Harris comes to his new duties with a thorough knowledge of advertising and business methods.

SEEKS ANOTHER BUILDING.

Sanford Motor Truck Company Is Preparing for Increased Business During 1913.

The Sanford Motor Truck Company, Syracuse, N. Y., maker of Sanford trucks, is increasing its facilities in anticipation of a larger output and has purchased of the Syracuse Savings bank the three-story building at the end of West Fayette street. The purchase price is not named. At least 300 trucks, it is expected, will be made this year, more than doubling the output.

While the company at present has only about 50 men on its payroll, it is anticipated that between 200 and 300 will be employed before the end of the year. Last summer the corporation's capital stock was increased from $25,000 to $50,000 for the purpose of caring for the increasing demand for its product. J. Frank Durston is president of the concern and F. F. Sanford is secretary and treasurer.

REORGANIZING KNOX COMPANY.

Will Specialize in Six-Cylinder Pleasure Cars, Fire Apparatus and Martin Tractor.

Arrangements for the reorganization of the Knox Automobile Company, Springfield, Mass., maker of Knox pleasure and commercial vehicles, which was recently petitioned into involuntary bankruptcy, are in progress and in a short time it is expected that the reorganized concern will be in full possession. The American Appraisal Company has been making an estimate of the value of the property for the purpose of effecting a just reorganization.

Edward O. Sutton, Harry G. Fisk and Charles C. Lewis of Springfield, Mass., were appointed receivers by Judge Morton in the United States district court and they qualified under a bond of $15,000 each. Mr. Sutton and Mr. Fisk have been assignees of the company since last September, when financial difficulties were first encountered. It is reported that the company will standardize the manufacture of six-cylinder pleasure cars, the Martin tractor and fire apparatus. Sales of the Martin tractor are said to have increased to a satisfactory volume and the fire apparatus business is stated to have also shown a steady growth. The Knox company reports that during the past three months under the trustees it has shipped for delivery to customers more cars than in the corresponding three months of the previous year.

NAMES CAUSE CONFUSION.

Therefore Michigan Automobile Company, Ltd., Becomes Fuller & Sons Manufacturing Co.

Exactly 10 years from the date of its incorporation, the Michigan Automobile Company, Ltd., Kalamazoo, Mich., ceased its existence and was succeeded on Dec. 31, 1912, by a new corporation, known as the Fuller & Sons Manufacturing Company. The firm has not built complete motor cars for a number of years and the change in name was thought desirable for numerous reasons. The recent incorporation of the Michigan Motor Car Company of the same city, maker of newer lines of Michigan cars, by the owners of the Michigan Buggy Company, caused confusion.

F. D. Fuller has been at the head of the Michigan Automobile Company, Ltd., since its organization and heads the new company as president and largest individual stockholder. His two sons have entered the firm and the eldest, L. C. Fuller, is designer, while W. P. Fuller is manager of sales. For several years the business has tended towards a smaller variety of parts, and transmissions have been specialized. Two types and sizes of planetary transmissions were developed and owing to the large demand much work has been done to perfect a variety of styles of 30 to 40 horsepower selective transmissions. The new company has a good machine tool equipment and many builders of complete motor cars buy its components rather than make them. The Fuller & Sons Manufacturing Company has $100,000 capital.

ANNOUNCES NEW DELIVERY CAR.

Baltimore Pleasure Vehicle Manufacturer to Add Commercial Line in Near Future.

An announcement of importance to the automobile world generally is made by Carl Spoerer's Sons Company, Baltimore, Md., maker of Spoerer pleasure cars, in regard to the new 1500-pound delivery wagon which the company will market about May 1. The car has been designed by Engineer Morrow and it is said the concern expects to manufacture 50 of them this year.

The officials, comprising Jacob Spoerer, Charles Spoerer, John F. Reus and B. J. Reus, believe there is a big future for the commercial light delivery car. The new wagon has a 30 horsepower, four-cylinder motor and a transmission affording four speeds forward and reverses. Its introduction will not affect the manufacture of the pleasure models and it is probable that the company will be forced to enlarge its factory.

TO INCREASE ITS OUTPUT.

Lord Baltimore Truck Company Expected to Erect a Large Factory Building.

The Lord Baltimore Motor Car Company, Baltimore, Md., has announced its intention of greatly increasing its output of commercial vehicles during the present year. John Luntz, Jr., president and general manager of the concern, also is quoted as saying that the firm contemplates the immediate erection of a large factory to produce and market the number of cars it has contracted for.

For several years the Lord Baltimore company has been making commercial cars in a somewhat limited way. The officers of the company are: President, John Luntz, Jr.; vice president and treasurer, John Luntz, Sr.; secretary, J. Elmer Stryker; engineer and designer, Otto R. Bieler.

EXTENDS BUSINESS FACILITIES.

Motor Accessories Mart in Chicago Adopts New Plan for Co-Operating with Manufacturers.

The Motor Accessories Mart, Chicago, has made a radical departure from its former line of business and has greatly extended its service and placed it upon a more practical basis. It has opened a salesroom devoted exclusively to the accommodation of factory representatives and manufacturers' agents of automobile accessories, this being located adjacent to the New Southern hotel and to all of Chicago's accessory jobbers.

Ample desk quarters are being furnished to patrons, with heat, light, janitor, telephone and stenographic service and only representatives of reliable and diversified lines are being admitted. The firm endeavors to make its place the common meeting spot of western buyers and sellers. Further service is being rendered in the matter of receiving mail, telegrams, express, etc., to promote the interest of the patrons.

The Studebaker Corporation, Detroit, recently filled an order for 40 of its Studebaker motor delivery wagons, secured through the company's London branch. This vehicle is the type so generally used by the United States government for the delivery of the parcel post.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

THE CHICAGO SHOW.

The first independent national show under the auspices of the Motorcycle Manufacturers' Association opened in the Manufacturers' Exhibition hall, Chicago, Ill., Monday evening, Feb. 3, for the remainder of the week. While at this writing the event is still in progress there is every evidence that the success of the venture will be such as to warrant continuing the plan, although this is a matter which will be taken up by the association at an early meeting.

Owing to the fact that the committee was unable to secure possession of the building until Sunday morning, there was no opportunity for decorations. There is little reason for believing that this situation interfered in any manner with the display in a business way, since it must be taken for granted that the thousands of visitors came to see the new models rather than their setting. It may be added, however, that the time for arrangement was so short that when the show was formally opened Monday night a few of the exhibitors were without full representation of their lines.

The majority of the machines were shown for the first time this season in New York, in connection with the automobile display in Grand Central Palace, and these already have been commented upon in these columns. Among these makes were the following: Merkel, Emblem, Pope, Monarch, Dayton, Excelsior, Thor, R-S, Harley-Davidson, Indian, Schickel, Pierce, Eagle, M-M, Henderson and Yale. Those which were reserved for presentation at Chicago were: A-M-C, Black Hawk, Crawford, De Luxe, Feilbach, Iver Johnson and Jefferson.

The New Machines.

The A-M-C is made by the Allied Motor Corporation, Chicago, and is marketed in two models, a four horsepower single with either belt or chain drive and a seven horsepower, chain driven twin. It follows conventional practise this year in utilizing mechanical valves. The magneto is a Bosch and the carburetor a Heitger. The forks are of the double acting rocker type. Grip control is employed, and all models are fitted with the Eclipse free engine clutch. Tires are optional, a choice of 28 by 2.5 inches or 29 by 2.75 being given.

The Black Hawk is a 4-5 horsepower single, produced by the Black Hawk Motor Company, Rock Island, Ill. A choice of either flat belt or chain drive is afforded. Both inlet and exhaust valves are mechanically operated. The magneto is a Bosch and the carburetor a Schebler. Lubrication is by force pump. The combination tank has a fuel capacity of 1.75 gallons and an oil capacity of three quarts. The brake and clutch are of the company's own design. The wheelbase is 53 inches and the tires 28 by 2.75.

The Crawford is a nine horsepower twin, chain driven, designed by R. S. Crawford and made by the Mid-Land Manufacturing Company, Saginaw, Mich. It has magneto ignition, mechanical valves, sight feed lubrication, disc clutch, cradle scroll spring forks, and 28 by 2.75-inch tires. The fuel capacity is 2.5 gallons.

The De Luxe is marketed in two chain driven models, one of seven horsepower and the other of nine. The maker is the Excelsior Cycle Company, Chicago. Both valves are mechanically operated. The magneto is a Bosch and the carburetor a Schebler. Lubrication is by a combined sight feed and force pump system. The gasoline capacity is two gallons and the oil capacity one. The forks are of the cradle suspension spring type. The brake is a Musselman. The wheelbase is 57 inches and the tires 28 by 2.75 inches. The clutch is an Eclipse.

The Fielbach is made by the Feilbach Motor Company, Milwaukee, Wis., and is a five horsepower single, belt driven. Both valves are mechanically operated. The magneto is a Herz and the carburetor a Heitger. The brake is a Corbin and the clutch an Eclipse. The tires are 28 by

Digitized by Google

2.75 inches or 28 by three at an option.

The Iver Johnson is produced by the Iver Johnson's Arms & Cycle Works, Fitchburg, Mass., in two models, a 4-5 horsepower, V belt single and a 7-8 horsepower, chain twin. Mechanical valves, Bosch magneto, Schebler carburetor, Corbin brake and Iver Johnson clutch are among the features. The twin has a gasoline capacity of 2.5 gallons and the single two gallons. The oil capacity is two and 1.5 quarts, respectively. Tires are 28 by 2.75 inches on the twin and 28 by 2.5 on the single.

The Jefferson is the new name of the P. E. M., which formerly was the Waverley, and is made by the Waverley Manufacturing Company, Jefferson, Wis. It is produced in two models, both chain driven, a four horsepower single and a seven twin. Both valves are mechanically operated. The magneto is a Bosch and the carburetor

Barco Brass & Joint Company, Chicago.

Lamps—Hawthorne Manufacturing Company, Bridgeport, Conn.; Badger Brass Manufacturing Company, Kenosha, Wis.; Chicago Cycle & Supply Company, Chicago; Hine-Watt Manufacturing Company, Chicago; Victor Auto Parts Company, Cincinnati, O.

a Heitger. Lubrication is by force pump. The gasoline capacity is two gallons and the oil capacity two quarts. The brake is a Corbin and the clutch an Eclipse. Tires are 28 by 2.75 inches. The wheelbase is 56 inches.

Those Who Displayed Accessories.

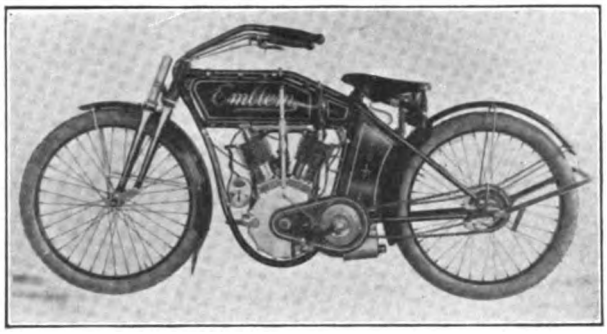
A large number of accessory houses were represented, some of whom were not to be seen at the automobile shows, although making motor car fittings and supplies. The list follows:

Magnetos and spark plugs—Bosch Magneto Company, New York City; Herz & Co., New York City; Splitdorf Electrical Company, Newark, N. J.

Brakes—New Departure Manufacturing Company, Bristol, Conn.; Corbin Screw Machine Corporation, New Britain, Conn.; Eclipse Machine Company, Elmira, N. Y.; Miami Cycle & Manufacturing Company, Middletown, O.

Carburetors—Wheeler & Schebler, Indianapolis, Ind.; Heitger Carburetor Company, Indianapolis, Ind.; J. W. Bottomley, Chicago.

Chains—Sarco Engineering Company, New York City.



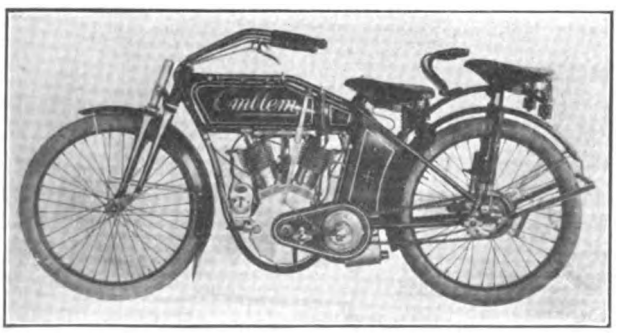
Horns and signalling devices—Purdy Bros., Chicago; pany, Cambridge, Mass.; Aermore Manufacturing Company, Chicago; National Cycle Accessory Company, Aurora, Ill.

Miscellaneous—H. T. Roberts, Chicago Cycle Supply Company, Excelsior General Supply Company, Purdy Bros. Company, Atlas Specialty Company, Chicago; Fentress-Newton Manufacturing Company, Detroit; Jenkins & Co., Des Moines, Ia.; Van Cleef Bros., Chicago; Morrison-Ricker Company, Grinnell, Ia.; Hughes & Wessling, Chicago; Kokomo Rubber Company, Kokomo, Ind.

Considering One Show Only.

It is stated that there is a proposition being considered by the various motorcycle manufacturers for one great national motorcycle show, to be held each year at Chicago, the New York City exhibition being entirely eliminated. The manufacturers are said to be dissatisfied with the space they received at New York during the big automobile show and regard the display in any event as practically a dealers' proposition, inasmuch as the eastern territory is closed up by the

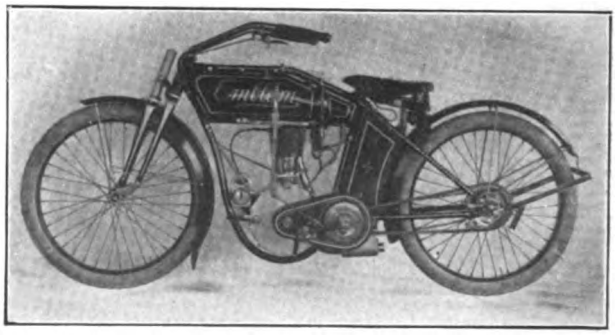
Digitized by Google



Eight Horsepower Emblem Twin, Equipped with Either Chain or V Belt.

time it is held. At Chicago, however, dealers from all over the West flock to the exhibition, at which time sales and contracts are consummated. Opinion has been sought relative to the proposal to hold one big show annually, as is the case in England, and although the majority of manufacturers appear to favor it, there were some who desired to wait until after the show at Chicago this year before expressing their convictions. It is quite likely that the matter will be given serious attention at a future meeting of the association.

The New Emblem Line.

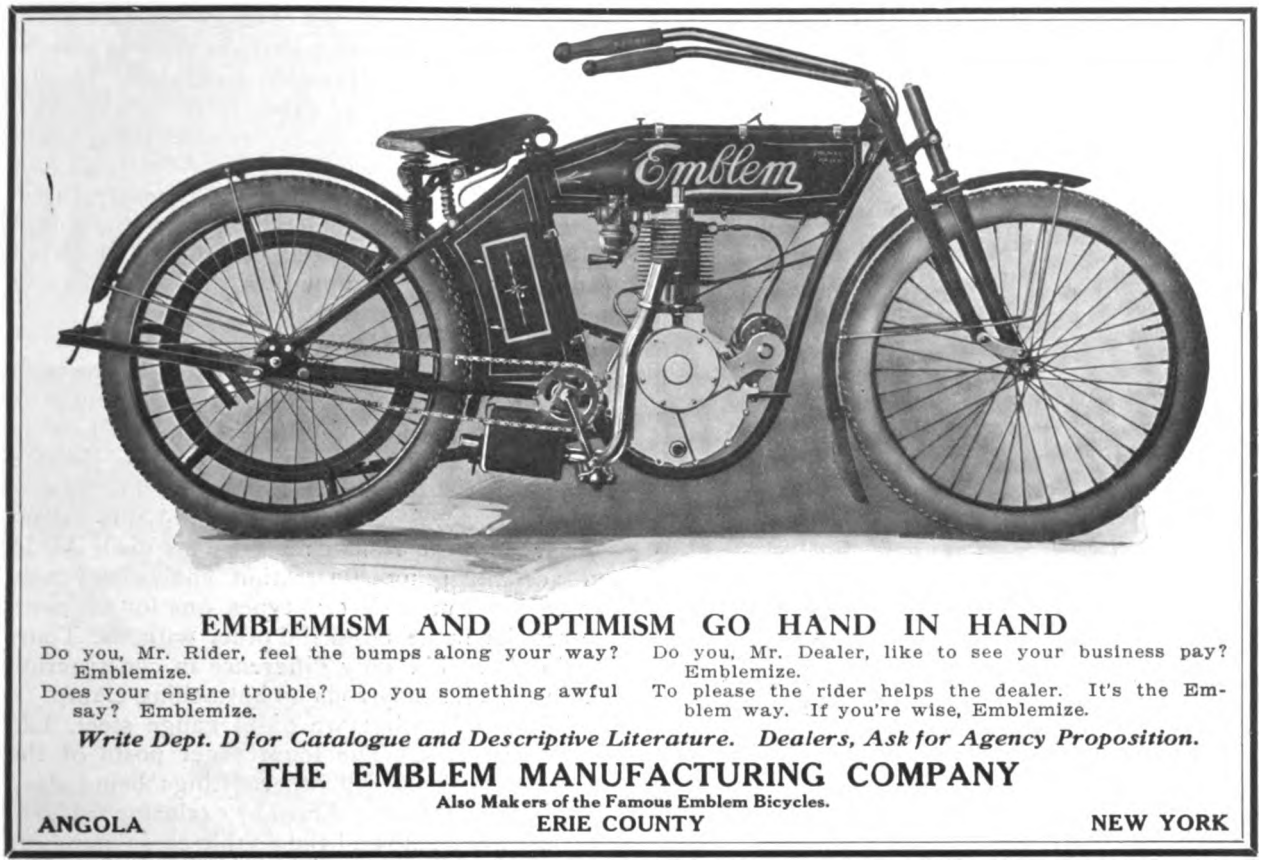


While it has been known in a general way for some weeks that the Emblem Manufacturing Company, Angola, N. Y., was to produce a big twin, the recent New York show was the first opportunity afforded for making careful examination of its interesting features. Besides this model, which is rated at 10 horsepower, and is chain driven, is another eight horsepower twin, fitted with either chain or V belt, and a five horsepower single, chain or V belt. Perhaps it would be more nearly correct to say there were two single models, since this machine may be supplied either with magneto or battery ignition. The others are equipped with magneto only.

The product of the Emblem Manufacturing Company has gained a wide reputation for its excellence, the motorcycles being particularly sturdy in construction, as is evidenced by the uses to which they have been put. It is not out of place to remark in this connection that the company also makes bicycles with the same standard in view. The secret is held to lie in the fact that Angola being a beautiful little town on Lake Erie, near Buffalo, the employees of the company are situated apart from the distracting influences of a large city and are able to devote their whole time and attention to the work in hand. Moreover, they are permitted to share in the company's profits, thus engendering a certain personal pride in the production of an article which merits the reputation it enjoys.

The Big Emblem Twin for 1913, Fitted with Tandem Attachment.

Two features stand out prominently on the 1913 Emblem. One is the substitution of the mechanically operated inlet valve for the automatic, and the other is the use of the chain drive on all models, although this latter is optional except on the big twin. Other differences will appear from a more detailed description of the mounts.



Five Horsepower Emblem Single May Be Had with Battery or Magneto.

The motor of the single and the big twin has bore of 3.5 inches and stroke of four, while that of the smaller twin has bore of 3.375 inches and stroke of 3.75. The cylinder is a special casting, being made in one piece, eliminating the possibility of leaky joints and is ground to a mirror finish. A large air space between the cylinder and the exhaust port makes for free circulation, and this together with the large cooling flanges is held to make for efficient cooling even at the highest speeds. The valves are made of nickel steel, 1.75 inches in diameter, and the exhaust tube is 1.375 inches in diameter.

The crankcase is of aluminum, machined very accurately to make for oil tight joints. On the lower right hand side is the glass oil sight gauge. The fastening of the lugs on the crankcase is designed to permit of quick removal of the motor, there being one on the front and another on the back. The fastening to the frame is by four

EMBLEMISM AND OPTIMISM GO HAND IN HAND

Do you, Mr. Rider, feel the bumps along your way? Emblemize.
Does your engine trouble? Do you something awful say? Emblemize.
Do you, Mr. Dealer, like to see your business pay? Emblemize.
To please the rider helps the dealer. It's the Emblem way. If you're wise, Emblemize.

Write Dept. D for Catalogue and Descriptive Literature. Dealers, Ask for Agency Proposition.

THE EMBLEM MANUFACTURING COMPANY

Also Makers of the Famous Emblem Bicycles.

ANGOLA ERIE COUNTY NEW YORK

bolts, a construction which makes for dismounting in a very few minutes. The cams and camgear are of one piece, the twins having four cams, one for each individual valve, this making for accurate timing. These parts are made from the best quality steel and are of ample size. The camshaft is hollow and allows the oil to flow into the gears and socket arms, keeping them properly lubricated at all times.

The engine flywheel is large in diameter, the bulk of the weight being in the rims, the centres being open, to eliminate unnecessary weight and aid in proper lubrication. The connecting rod is a steel forging, fitted with a non-grain bronze bearing at the crank end. The piston is a special steel casting with convex top, fitted with two piston rings. Both piston and rings are heat treated and ground to a mirror finish.

Lubrication is by force feed pump and sight feed, both of which are part of the tank, located just ahead of the saddle, making for convenient operation. The crank and flywheel shafts being hollow and being supplied with oil holes, permit the lubricant to flow to all bearings both inside and out. Non-grain bronze bearings are utilized throughout. Provision is made at the base of the crankcase for drawing off all old oil. The combination tank has a fuel capacity of two gallons and oil capacity of two quarts. The carburetor is of special design with auxiliary air intake.

A Herz magneto is employed, and this is driven by a train of gears operated by the camshaft, which is designed in such manner that the covers of the cams, gears and magneto gearcase may be removed readily for inspection or adjustment. The arrangement is such that the magneto may be removed without disturbing the gearcase

or gears. On the battery model, three dry cells are utilized, these being securely fastened in a battery case specially designed for this purpose.

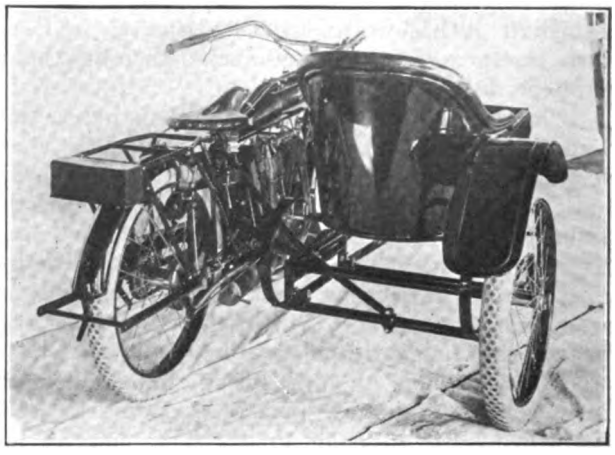
Two Police Officers from Hartford, Conn.: Joseph R. Lacy and Pope; Richard E. O'Meara and Flying Merkel.

The frame is of the triangular reinforced type, which has proven a valuable feature in the sturdiness of Emblem construction. The lower tube has a very graceful curve which loops the base of the motor, it being maintained that this eliminates all strain and possible chance of breaking the motor base or fastenings. The frame head has a truss web between the main branches. The material throughout is the best quality of seamless tubing and steel forgings.

The forks have been redesigned with a wide crown, permitting the use of larger tires and non-skid chains. The Emblem fork is held to be very flexible, with an up-and-down movement of 2.5 inches. The spring is long and large in diameter. The lower bearings are made of tool steel, and are securely locked against rattle or looseness. There are four steel rocker links which support the spring fork to the main fork, one on the inside and one on the outside of each.

The triple-stem handle bar is made from one-inch heavy steel tube of special temper, which is held not to bend or twist under the most severe strain. The bars are wide and have a graceful curve, the design being such that when turning sharp corners they are not in the way. The control is of the double grip type.

All models are fitted with the Eclipse free engine pulley and variable speed clutch. An option of Corbin or Eclipse brakes is offered. The saddle is a Troxel with compound springs, or a Messinger cavalry or Person's saddle may be had if desired. Tires are 28 by 2.5 inches, Continental-Erie being fitted as standard, with Goodyear as an option. The equipment also includes an unusually complete set of tools for repair work.

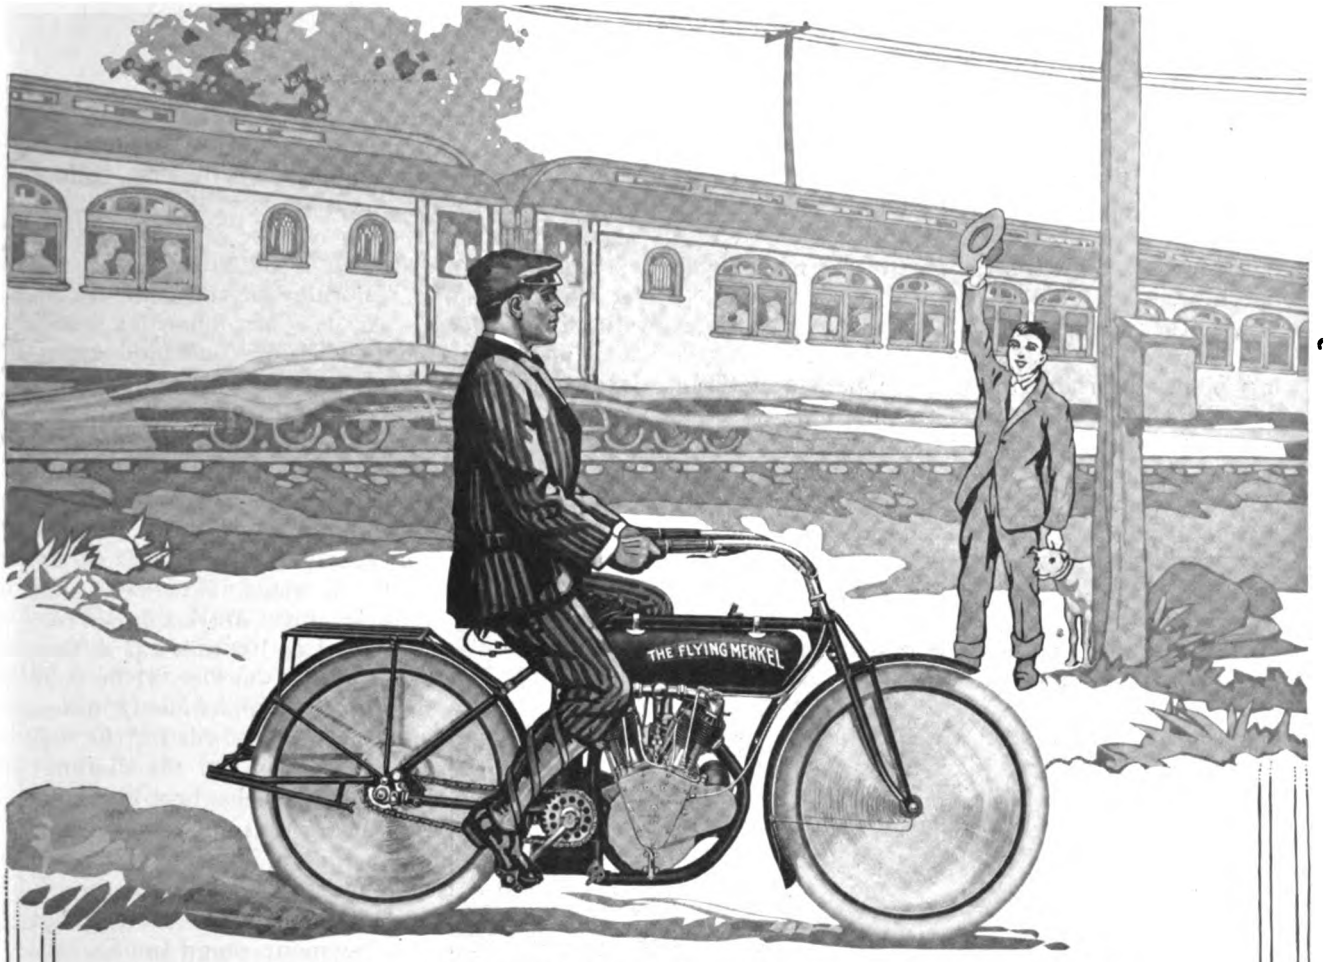


The company offers a cushion tandem attachment, fitted with adjustable handlebars to suit the convenience of the extra rider. It has two large cushion springs on either side, these being encased in steel telescopic tubes. Adjustable foot rests also accompany this equipment. Interchangeable with the tandem attachment is a luggage carrier of substantial design, in which all joints are brazed, eliminating the possibility of shaking loose.

The Indian Sidecar.

In view of the increasing interest in the subject of sidecars as evidenced by the number of concerns now manufacturing this product in America, it is not surprising that the Hendee Manufacturing Company, Springfield, Mass., should have designed an auxiliary of this nature for use with the Indian motorcycles made by it. An accompanying illustration shows the new car, which is made in two types, one for use with the regular models and the other with the Tourist Trophy. The only difference in construction lies in the rear stay rods and attaching clamp.

All chassis tubes are of 14 gauge steel, 1.25 inches diameter. The four corner posts of the frame are of steel, all other fittings being drop forgings. What are claimed as exclusive features are the drop frame and the double cross members at the rear and left side. The low frame suspension is held to induce the machine to hold the road at speed and on corners and to make for easier riding. The double cross members are expected to insure extreme rigidity.



The rear stay rods connecting the sidecar to

Neat and Attractive Sidecar Utilized Exclusively with Indian Mounts.

the motorcycle have slidable anchorage to permit the car and machine being properly aligned in a parallel vertical plane before being rigidly

connected. The chassis wheel axle spindle is of vanadium steel, .875 inch in diameter, and is solidly brazed to the upper rear tubular member. The chassis road wheel is very similar to the regular Indian motorcycle front wheel, but the hub is larger and it carries a 2.75-inch tire. It is set 12 inches ahead of the driving wheel, instead of in a line with it, a practise which is expected to make for less effort on the part of the motorcycle operator.

Another feature for which special advantages are claimed is the width of frame and body, giving plenty of room for a large person without necessitating a wider road tread. This latter is accomplished by mounting the wheel close to the frame and body and attaching a generous fender. Sidecar comfort depends largely upon the springs. Two three-leaf double scroll carriage springs of high tempered vanadium steel are employed. The leaves are .1875 inch wide, while the distance between the front and rear spring eyes is 28 inches. The overall length of the spring is 41.375 inches, and each rides on double seats at the frame corners.

Four Thor Riders from Worcester, Mass.: Left to Right, E. A. Mills, A. J. Noonan, C. Zickell, A. R. Goodwin.

The lateral distance across the chassis is 23.75 inches. Steel is used for the body construction, the important dimensions being: Length from bottom of seat back to forward interior of the hood, 49 inches; seat, 20 inches long and 19 wide; inside height of seat back, 20; outside, 21; door, 13.5 inches wide and 11 high; height of arm rests from seat floor, 12; height of body sides forward of arm rests, 17. Coil springs are utilized in the seat cushions, which are upholstered in smooth black leather. Provision is made for carrying goggles, maps, etc., and there is a spacious tool compartment under the cushion.

Humiston's New Records.

The records established at the Playa del Rey motordrome at Los Angeles, Cal., by Lee Humiston on Dec. 31, 1912, and Jan. 8, 1913, will stand regardless of whether or not the sanction for the event was legally issued, is the statement made by Chairman J. P. Thornley of the competition committee of the F. A. M. Mr. Thornley states that the measurements of Humiston's mount conform to the F. A. M. requirements, the necessary affidavits to this effect having been received from W. G. Collins. The records are now recognized officially, inasmuch as the chairman of the competition committee believes the rider entered the contest in good faith that he was legally sanctioned to do so.

It develops, however, that Humiston did not establish records for 1 to 100 miles as at first announced. On Dec. 31 he rode his Excelsior machine 12 miles, creating new records for the distance, his time for the distance being 7:37.6, the best previous time being that of Ray Seymour on an Indian, 7:39. Comparison of Humiston's time with the official record table shows that Ray Seymour, on an Indian, still holds the records from 13 to 25 miles, inclusive, while from 30 to 100 miles, Humiston secures new marks, his time for the 100 miles being 1:08:01.8. His distance for the hour was 88 miles, 350 yards. This also is a new world's record.

New Merkel Agencies.

The following are new agencies appointed by the Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles: C. E. Wyeth, Newark, O.; Wesley T. House, Wheeling, W. Va.; Kearney Hardware Company, Kearney, Neb.; O. R. Inglis, Rumford, Me.; F. R. Drew Company, Cedar Rapids, Ia.; Anthony Cycle Company, Des Moines, Ia.; C. Jungbluth, Washington, Ia.; L. S. Chidestar, Ottumwa, Ia.; J. K. Haroldson, Rembrandt, Ia.; Washta Implement Company, Washta, Ia.; L. Kirkegaard, Sioux City, Ia.; Jons Auto Company, Boone, Ia.; O. H. Kathman Company, Quincy, Ill.; Stoddard Electric Supply Company, Michigan City, Ind.; W. E. Wandersee, Detroit; L. G.

Chicago Wants the Convention.

The combined motorcycle clubs of Chicago are considering plans to bring the next F. A. M. convention to that city and a tentative programme already has been mapped out. It is claimed that if the convention could be brought to Chicago more riders would participate in the tours, as thousands would attend from Ohio, Indiana, Illinois, Michigan, Kentucky, Iowa, Missouri, Kansas, North and South Dakota, Minnesota and Wisconsin. The programme is formulated to cover a week and a meeting of the Chicago clubs will be held to consider it. The decision with respect to the convention seat will not be made by the F. A. M. directors for some time.

Motorcycles at Toledo Show.

At the recent automobile show at Toledo, O., there was an excellent exhibition of motorcycles, five makes being shown, as follows: Indian, Merkel, Excelsior, Henderson and Yale. The two-wheel machines attracted much attention and the dealers having the exhibits in charge reported numerous sales throughout the week. The agents for the Harley-Davidson, Thor and R-S did not show their machines because of inability to secure space from the show management. However, they report that business is good and they expect to sell more than their yearly allotment.

Growth of Bosch Production.

An accompanying chart illustrates in a graphic manner the growth of Bosch Magneto Company's business in supplying motorcycle magnetos, and inasmuch as a large majority of the American mounts are equipped with Bosch ignition it offers some indication of the growth of the industry. It is pointed out in this connection there were about the same number of manufacturers producing mounts each year, but of course the number of machines utilizing magneto ignition has been growing steadily. This is not in itself sufficient to explain the remarkable increase in the production curve, which for the fiscal year beginning July 1, 1912, shows an increase of 216 per cent. over previous seasons.

The chart indicates that previous to the present season there was disposition on the part of the motorcycle manufacturers to delay calling for shipments of ignition equipment until about Jan. 1 while the demand has been steady throughout the entire year until Jan. 1, 1913. The dotted line, as carried out, number of magnetos that have ben contracted for as to be delivered in the months indicated.

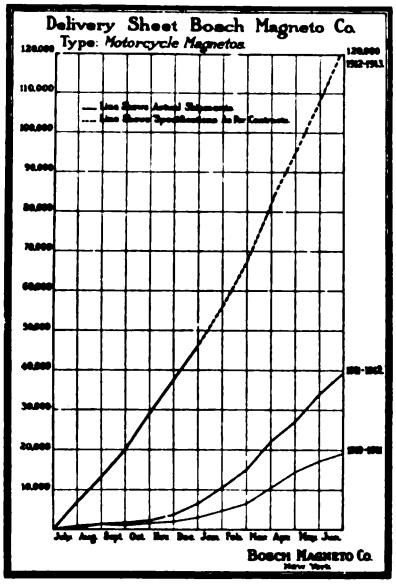

Chart Indicating Production of Bosch Motorcycle Magnetos.

Yale as Economical Transport.

Frank Bitner, a Chicago cement contractor, last year used his Yale machine almost every day in going from job to job and he reports that he found it the cheapest transportation that he could secure. Gasoline and oil were his only purchases and he averaged 78 miles on a gallon of gasoline and better than 190 miles for a gallon of lubricating oil.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

Park Motors Company, Columbus, O.; $30,000; to deal in automobiles; incorporators, Scott Van Etten, Charles Parkison, A. Van Etten.

Automobile Clearing House Company, Cincinnati, O.; $2500; to deal in motor cars; incorporators, Thomas A. Reilly, Edwin P. Bernardi, Samuel D. Bromley.

Detroit Flash Curtain Company, Detroit; $25,000; to manufacture motor car curtains; incorporators, Fred J. Schaffer, William H. Goodfellow, Harry M. Vaughn.

WITH THE MANUFACTURERS.

R. M. Hawkins, formerly assistant purchasing agent of the Standard Welding Company, Cleveland, O., maker of Stanweld rims, etc., has resigned his position.

The Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of Pierce-Arrow cars, announces that the Iowa Auto & Tire Company, Davenport, Ia., which handled the company's product at Davenport up to 1911, no longer represents the company, the present distributor being the Mason Carriage Works of that city.

The Bosch Magneto Company, New York City, announces the appointment of the following new distributors: Doubleday-Hill Electric Company, 719-721 Liberty avenue, Pittsburg, Penn.; Motor Parts Company, 185-187 Columbus avenue, Boston, Mass.; Phoenix Automobile Supply Company, 3974-76 Olive street, St. Louis, Mo.

The Packard Motor Car Company, Detroit, maker of Packard cars, has purchased a plot of land at Locust and 22d streets, St. Louis, Mo., through its local agent, the Halsey Automobile Company. It is understood to be intended for service station purposes.

C. Robert Hoyme, prominent on the Philadelphia automobile row for seven years, has been appointed manager of the Alco branch in that city by the American Locomotive Company, New York City, maker of Alco trucks and pleasure cars. Mr. Hoyme previously was sales manager of the International Motor Company's branches at Philadelphia, Baltimore and Washington, and before that was associated with the Autocar Company, Ardmore, Penn., maker of the Autocar line.

Forrest M. Keeton, president of the Keeton Motor Company, Detroit, maker of Keeton machines, announces the appointment of P. L. Lovelace as foreman of the painting department and John Andre as foreman of the trimming department. Both formerly held similar positions with the Packard Motor Car Company, Detroit, maker of Packard cars.

The Kelly-Springfield Motor Truck Company, Springfield, O., has moved its New York City branch to 239-241 West 56th street, where it is in charge of A. S. Holly.

The Cataract Rubber Company, Boston, Mass., maker of Cataract tires, intends soon to open a branch at New York City. The branch recently established at Providence, R. I., to handle all of the Rhode Island business, was the third step in the company's plan to cover the country with distributing stations for its product.

Edward J. Samuels, who has been head of the publicity department of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has gone to London, England, where he will take up the same line of work for this company. Mr. Samuels has been very successful in this country and the Goodyear executives expect excellent results in his new field.

R. Cairncross Campbell, former manager of the Adams Bagnall Company, Philadelphia, sailed for London recently to become assistant manager to F. S. Bennett of the Buick and Oakland branch of the General Motors Export Company.

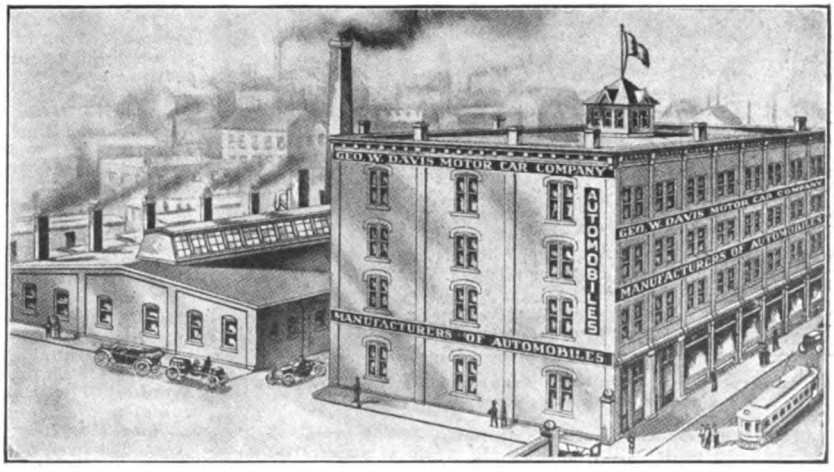
D. F. Kallah, general manager of the Hartford Auto Parts Company, Hartford, Conn., for the past four years, has resigned to enter a new field of business.

The Findeisen & Kropf Manufacturing Company, 21st and Rockwell streets, Chicago, maker of Rayfield carburetors, has established new branches at 1140 Michigan

Digitized by Google

boulevard, Chicago; 1902 Broadway, New York City and 997 Woodward avenue, Detroit, Mich.

W. P. Dean has formed the Keeton Motor Company of New England to distribute throughout that territory the product of the Keeton Motor Company, Detroit. Mr. Dean was manager of the Detroit branch of the Olds Motor Works, Lansing, Mich., maker of Oldsmobiles, from 1908 to 1911. He has already placed agencies for Keeton cars at Bridgeport and Hartford, Conn.; Providence, R. I.; Worcester, Mass., and other cities.



The Marathon Motor Works, Nashville, Tenn., maker of Marathon cars, has plans under way for one of the finest club buildings in the south. It will be used expressly for the employees of the plant and will have all the conveniences of the best clubrooms in the city. Among the many attractive features offered will be a well-equipped gymnasium, a large concrete swimming pool, tub and shower baths, billiard room, large parlor, library room with a liberal supply of the best and latest books and magazines, and a spacious ball room that may be converted into a banquet hall when occasion demands.

The Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly-Springfield trucks, has announced the appointment of Henry Schmidt as manager of its new branch at Seattle, Wash. Mr. Schmidt was formerly connected with the Packard selling organization at Seattle for a number of years.

Charles Drum, connected until recently with the production department of the Packard Motor Company, Detroit, maker of Packard trucks and pleasure cars, has become production manager of the Keeton Motor Company, Detroit, maker of Keeton cars.

The Findeisen & Kropf Manufacturing Company, Chicago, maker of Rayfield carburetors, recently held the annual meeting and booster dinner of its sales and service departments at the New Southern hotel, Chicago. Carburetion in all its phases was discussed and much enthusiasm for Rayfield success was demonstrated.

The George W. Davis Motor Car Company, Richmond, Ind., is well equipped for the manufacture of the Davis car, which was displayed for the first time in the East at the recent New York show. An accompanying illustration presents the plant, which is modern in every particular, being equipped with all the latest devices known to the science of metallurgy. Men of national reputation in the industry are in charge of the production of the Davis automobiles, insuring a high class product.

Factory of George W. Davis Motor Car Company, Richmond, Ind.

The Russell M. Seeds Company, Indianapolis, Ind., a well known advertising agency in that city, has removed to more commodious quarters in the Central Union Telephone building, New York and Meridian streets. Rooms 402-417 are being occupied with general entrance at 403.

The Federal Rubber Manufacturing Company, Milwaukee, Wis., has established a factory branch at 361 Golden Gate avenue, San Francisco, and patrons of the company will be given first class service. E. L. Rettig, Pacific Coast manager of the company, is in charge.

The Ernest Lee Machine Company, Cleveland, O., manufacturer of automobile accessories, has plans for the erection of a new factory to cost about $15,000.

J. W. Mount & Co., Red Bank, N. J., maker of automobile bodies, is having a large addition erected to its factory, at the corner of Maple avenue. This is expected to care for the large growth of business which the firm has enjoyed during the last few months.

E. F. Howell is in charge of the new factory branch established by the Chase Motor Truck Company, Syracuse, N. Y., maker of Chase trucks, at 3607 Lancaster avenue, Philadelphia, Penn.

The McNaul Auto Tire Company, Toledo, O., has moved into the three-story building on Superior street and the entire structure will be remodelled to facilitate the manufacture of a tire with an extra heavy tread.

The Moore Truck & Manufacturing Company has been formed at Detroit and will locate in the Debo building on First street. The company will manufacture the Moore patent barrel truck.

The Abendroth & Root Manufacturing Company, Newburg, N. Y., maker of motor trucks, has opened a branch factory and salesroom at 237 Halsey street, Newark, N. J. A. C. Bogardus of Montclair, N. J., is manager of the plant.

The McVey Manufacturing Company, Dayton, O., maker of automobile accessories, with a capital stock of $60,000, is planning to enlarge its factory.

GARAGE AND DEALER.

The Van Winkle Motor Truck Company, Atlanta, Ga., has opened a factory sales office and service branch at 39 Houston street. I. B. Lawton is general sales manager.

F. W. Ramm & Sons, operating a garage at St. Petersburg, Fla., has decided to incorporate in order that a larger and more complete establishment can be maintained to care for increasing business. The capital will be $100,000 and many of the leading business men of the South have taken stock.

The Universal Motor Truck Company, Cleveland, O., is a strong addition to the automobile houses of that city. The sales and service departments are located at 2352 Euclid avenue. C. W. Moody is general manager and M. J. O'Connor and J. A. Boyd will have charge of the sales department.

The Belcher & Loomis Company, 89 Weybosset street, Providence, R. I., is admirably located in the centre of the city, where it maintains a general agency for a wide variety of automobile accessories and supplies. Inasmuch as the store is on the direct line of travel for visiting motorists there is abundant reason for calling attention to the products handled by the concern in attractive window displays. An accompanying illustration presents the manner in which this important feature of the business is conducted.

Joseph A. Hill and Charles L. Vermylea of Catskill, N. Y., have leased a building on West Bridge street which will be entirely remodelled for a first class garage to be operated as the Peerless Garage Company.

James W. Stockard and J. B. Church, managers of the International Auto Company, El Paso, Tex., are having a new building erected on Campbell street, in which they will handle automobiles and accessories.

A. Spencer Wright has opened a first class garage on Prospect street, Oneonta, N. Y. A large workroom for repairing is located in the rear.

Weaver & Wittle, Lebanon, Penn., have opened a first class garage and machine shop in Walnut alley. In addition a repair shop will be operated.

The Ozark Motor Company, Springfield, Mo., has been incorporated with a capital stock of $5000 and will be located at 231 South Jefferson street.

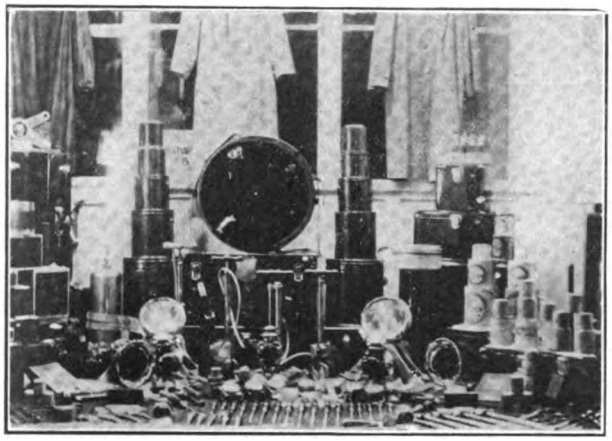
The St. Joseph Automobile Company, St. Joseph, Mo., of which Louis M. Pierce and C. W. Davis are the managers, will occupy and maintain a large modern garage on Ship street, for which a building was recently erected.

The Pugh Motor Car Company, Kingston, Penn., has leased its garage to W. B. Buckley and H. E. Drews, who will in the future conduct the business at 592-594 Market

Digitized by Google

street under the style of the Kingston Motor Car Company.

The City Garage, Norfolk, Va., has installed a vulcanizing plant and in addition will handle the Thermoid Rubber Company's Nassau tires.



C. W. Moody, formerly with the Nyberg Automobile Works, Anderson, Ind., maker of Nyberg cars, and John Clark, formerly superintendent for the company, will open a new garage in the Zeigler building at Anderson.

The Oklah Garage has been moved from its present quarters at 313 to 317 Keeler avenue, Bartlesville, Okla., and the garage feature will be discontinued. Instead a supply store will be opened, equipped with automobile parts and several good makes of cars will be handled.

Dayre Courtney has opened a garage and automobile supply house on Main street, New London, Ia. He will handle several makes of cars and carry a full line of automobile accessories.

Frank Cook of Lakewood, N. J., has taken over the garage in that place formerly operated by the McCue & Beecroft Company. He will handle all kinds of automobile supplies.

Jones & Williams, owner of the Beaumont Garage & Machine Company, Beaumont, Cal., is erecting a new garage on D street, which is nearly ready for occupancy.

Attractive Show Window Arranged by the Belcher & Loomis Company, Providence, R. I.

The Warner Automobile Company, Watertown, N. Y., has sold its entire interests at 155 Arsenal street to Perl W. DeVendorf. Mr. DeVendorf has secured the agency for the Ford cars, made by the Ford Motor Company, Detroit.

The Mt. Pleasant Garage, Harrisburg, Penn., recently known as the Broadway garage and located at 1358 Thompson street, has changed hands and will resume its former name.

The Colonial Motor Company, Baltimore, Md., distributor for Studebaker cars and Universal trucks, has opened a new fireproof garage on North avenue.

The Morristown Auto Company, Morristown, N. J., recently incorporated with capital stock of $25,000, has located its office at 34 Pine street, with A. Newmark in charge as manager.

The J. S. Hoffman Motor Car Company, Sharon, Penn., has occupied a new garage recently erected at the corner of Vine street. The Chalmers and Overland cars will be handled.

The Modern Garage Company, Titusville, Penn., will soon occupy a new garage, which is now in course of completion on Central avenue.

The Anderson Automobile Company, Lancaster, O., located in the Keller building, is making improvements to its garage.

The Herring Motor Company, Des Moines, Ia., has moved into its new building on West 10th street, which was recently erected at a cost of $100,000. The company is wholesale jobber of automobile accessories and supplies.

Samuel A. Yout, Little Rock, Ark., has purchased the automobile business formerly conducted by the Reinman & Wolfory Auto Company of that city, and will operate it under the name of Arkansas Auto Exchange. The garage on Third street will be remodelled.

Walter Miller has opened a new garage on Broadway, Davenport, Ia. A complete repair shop has been installed and Mr. Miller will do all kinds of automobile, motorcycle and bicycle repairing.

C. O. Donner, Alexandria, Minn., has purchased the entire stock in the Alexandria Auto Company, held by his partner, J. A. Bailey, and will continue the business under its original name.

Donald MacFarlane, who conducts an automobile repair business at Berkeley, Cal., has been forced to enlarge his plant because of additional business.

The Two Republics Garage, Texas street, El Paso, Tex., is being enlarged by the erection of a substantial addition.

Newton B. Smith of New Brunswick, N. J., has opened a new garage in that city at 222 Nelson street. He will do repair work of all kinds and handle the Marion and Studebaker cars.

The Sims Automobile Company, Grand Forks, N. D., has opened a garage at Park River, with Clement Woods, formerly of Grafton, in charge as manager.

The R. M. Allen Motor Sales Company, 1924 Euclid avenue, Cleveland, O., has been formed to handle the Velie and Paige lines.

The Birmingham Motor Company, Birmingham, Ala., will soon occupy a new garage on Avenue C, which will be equipped with a modern repair shop.

The Keystone Garage Company, Altoona, Penn., has opened an up-to-date garage on 11th avenue. A repair shop also has been installed.

The Elgin Motor Company, Elgin, Ill., has been formed to conduct a modern garage, supply house and automobile agency and has located on Spring and Milwaukee streets. The agency for several well known makes of cars has been secured.

Albert Rhyan and Arthur Carbary of Lafayette, Ind., have opened a new garage and repair shop at South and Main streets, to be known as the Oakland garage.

The Boyett-Brannon Tractor Company, 70 South Forsythe street, Atlanta, Ga., announces that it will for the present manufacture its motor tractors by contract.

The Hanover Garage on Abbottstown street, Hanover, Penn., will soon be enlarged, the business having greatly increased under the management of Robert E. Spangler.

The Southern Auto & Equipment Company, Atlanta, Ga., has established a business at 94 South Forsythe street. In addition to doing repair work a full line of supplies and accessories will be carried.

The Steinbach Company, Asbury Park, N. J., is erecting a garage adjoining its present establishment on Bangs avenue. The company handles the Mack and Flanders vehicles.

The Rustling Stone Company, Irvington, N. J., has erected a new garage at 152 Shaw avenue, equipped with modern appliances.

The A. P. Tire & Vulcanizing Company, Asheville, N. C., has established business in the Arbogast Motor Company's building on North Main street. The company will deal in automobile tires and rubber goods and has also installed a rectifying apparatus for charging storage batteries.

The Adams Garage, 306 Franklin street, Natchez, Miss., has been sold to the Motor Repair Exchange and the business will be merged and conducted at the same address.

The Streaker Implement Company, Bellevue, O., has taken the agency for Studebaker cars, made by the Studebaker Corporation, Detroit, Mich., and will remodel the building on West Main street.

Dr. H. A. Davis has sold his interest in the Dickinson Motor Car Company, Dickinson, N. D., and that concern is now under the management of Wilcox & Clark.

The Dell Rapids Auto & Supply Company, Dell Rapids, S. D., has outgrown its plant and is building extensive additions.

The Stewart Automobile Company, 231 West 54th street, New York City, has taken the agency for the Pullman cars, made by the Pullman Motor Car Company, York, Penn. A service station has been established and all parts of the Pullman machines are carried in stock.

The Abbott Motor Sales Company, Toledo, O., of which L. E. Barger is manager, has made arrangements to occupy its new building at Madison avenue and 15th street. Its former quarters were at 623 Madison avenue.

The Central Garage, recently established by Frank Cliber and Andrew Stone, Jr., at Hollidaysburg, Penn., has been opened to the public and is enjoying generous patronage. The garage is modern in all particulars and the structure is fireproof.

Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O., were regular equipment on 142 of the 329 cars displayed at the recent New York automobile show. Goodyear tires were, on the average, displayed on one-third of the cars exhibited during 1912 at the automobile shows throughout the country, it is claimed, and the increase this year indicates the growing popularity of this make.

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is *next to criminal.*

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by "sideswiping" a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes---well, once is too often."

Weed Anti-Skid Chains

vs.

Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when the roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make **the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours

Take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On the Rear Tires

they afford perfect traction and adequate brake control.

On the Front Tires

they act as ladders to enable the front wheels to easily climb out of mud-ruts, car tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN** your car to safety.

Cut Your Gasoline Bills In Half!

By Using the M&M Economizer

The M&M is nickel plated and highly polished. It requires a 3-4 inch pipe tap to insert into manifold. It will increase your speed and power 20 per cent. with less gasoline and less carbon. Will POSITIVELY save you from 40 to 50 per cent. of gasoline. It is the only known carbureter adjuster on the market, and can be used for priming the engine.

BEWARE OF INFRINGEMENTS!

Your Money Will Be Refunded in Thirty Days if the M&M is Unsatisfactory

Price of Automobile Size $3.50 complete with friction control. (By mail 17c extra.)
Price of Motorcycle Size $1.25 prepaid.

Ask your dealer or jobber about it. Send for 1913 catalog and full information.

Remy Magneto

Chosen by America's leading manufacturers

More Remy Magnetos are being used on 1913 American Automobiles than all other makes combined.

Our contracted sales for 1913 are Five Times Greater than in 1912.

We ship over 13,000 Remys monthly.

This is an expression of the confidence of this country's foremost manufacturers in Remy Magnetos and the facilities of the Remy plant in Anderson, Indiana.

See that a new Remy is on the car you buy.

Exchange your old magneto (any make) for a new 1913 Remy; it will cost you practically no more than repairs on your present ignition system.

Gallon Less Per Hour!

Mr. Smith saves $2.00 every 10 hours on basis of 20c gas, and gets better control.

YOU CAN SAVE

10% to 25%

Gasoline on your Automobile

Ask your dealer to put one on your car at our expense.

Sold only on a satisfaction or money back basis.

20 Miles to Gallon

G. A. Schmidt, Lawrence, gets 20 miles to gallon on his car.

4300 Miles Without Miss

The "Dream's" owner claims 4300 miles without one moment's trouble.

Power

The Planhard was on the motor winning the great ploughing contest in Argentine—$3000 prize.

Mr. Smith's Letter

THE GRAY & PRIOR MACHINE CO.
Portland Branch
117 Commercial Street, Portland, Me.

Planhard Mfg. Co.,

Gentlemen: I used one of your Planhard carburetors on the 20 h. p. model X Hartford motor in my semi-speed boat Hartford III during 1912.

My boat is well equipped to make tests, as I use a tachometer. I get better control with a Planhard and use **practically one gallon of gasoline less per hour** than when I used one of the most popular carburetors in use today. I have put a Planhard on my automobile as well.

Very truly yours,
A. N. Smith.

You can get all the power your motor can give by using a Planhard.

Compare its simplicity with that of any other carburetor!!

Absolutely automatic. No springs, valves or cams. Permanent adjustment. Gives increased power and speed with any gas in any weather. Send for chart and book showing mileage when Planhard will have paid for itself on your car.

DEALERS, Send for our proposition.

PLANHARD MFG. CO.
1790 Broadway, N. Y.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

Prime Your Motor

If you have "ALL-IN-ONE" Spark Plugs you can quickly prime your motor and easily start it on the very coldest morning. Easy priming is only one of the advantages given by the "ALL-IN-ONE" Petcock. Open the petcock while the motor is running and all soot will be blown off the sparking points—a true *self-cleaning plug.* Open the petcocks when the motor is missing and you'll quickly detect which cylinder is giving trouble—a *real trouble finder.* Open the petcock and inject a little Kerosene—this is the *best carbon remover* ever tried.

"ALL-IN-ONE" has the best features of other plugs and the Petcock besides.

Price $1.50 each.

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

THINK OF YOUR WIFE

When you are buying Your 1913 Car

Imagine her, if you can, on a crowded street, daintily dressed, grabbing a dirty, greasy crank handle and grinding away like a derrick hand.

NO WONDER LADIES LIKE ELECTRIC CARS

with their daintiness and convenience.

But your new car will be just as dainty, just as convenient for women's use, if you insist upon having it equipped with

ELECTRIC CRANKER AND ELECTRIC LIGHTS

However, their efficiency and sure, unfailing service depend upon the battery that operates them.

BE SURE YOURS IS AN

GLBA

STORAGE BATTERY

Use Class A GLBA Battery with an Electric Lighting Generator
Use Class B GLBA Battery with an Electric Self-Starter

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3¼-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

Bosch Plugs

AS GOOD AS BOSCH MAGNETOS

IN the 14 important automobile road races of 1912, Bosch Spark Plugs were on every winner—14 long, trying contests—14 proofs of Bosch Plug superiority. These tests included the following important contests:

The Vanderbilt Cup	**Elgin Trophy**	**500 Mile Sweepstakes**
The Grand Prize	**The Santa Monica**	**The Aurora Trophy**

When the majority of racing drivers and manufacturers entering cars in important road races uses one make of plug you can be positive that reliability and efficiency are in that plug; you can be assured of its meeting your every requirement.

When fitting out be sure you buy Bosch Plugs; they are built by the the makers of the Bosch Magneto and are as good.

BOSCH PLUGS FROM YOUR DEALER **$1.00 EACH** OR ORDER DIRECT FROM THE

COES

THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Firestone
NON-SKID TIRES

THE confidence felt by Firestone users explains the widespread choice of Firestone Non-Skid Tires:

—Confidence in the secure road-grip of "NON-SKID" sharp edges, abrupt angles and deep, vacuum-creating hollows.

—Confidence in the ability of these tires to take the car safely over rain-soaked asphalt, or through mud or slush;

—Confidence in the builder, who is *personally* responsible for every tire—the man with whom quality has been a habit for over twelve years;

Security greater than that of any other tire or mechanical device, without the shortening of tire life and ruining of the road which such devices incur;

Economy of longest tire wear, smallest gasoline consumption; greatest car protection;

Comfort of riding by means of extra thick, unusually resilient tread.

These are the *extra values* every Firestone user buys. Specify these Non-Skid Tires for your car.

INVADER OIL

The increased cost of Pennsylvania Crude has lessened the supply of high grade lubricating oils and flooded the market with low grade, low gravity oils totally unfit for Automobile lubrication.

INVADER OIL is the same now as it has been since the commencement of the Automobile industry —the highest grade cylinder oil that can be produced and made from pure Pennsylvania Crude. It costs more and it's worth more.

Remy Magneto

Chosen by America's leading manufacturers

More Remy Magnetos are being used on 1913 American Automobiles than all other makes combined.

Our contracted sales for 1913 are Five Times Greater than in 1912. We ship over 13,000 Remys monthly.

THE greatest aggregate board of automobile engineers in the world recommends the use of the new Remy Magneto. This is an expression of the confidence of this country's foremost manufacturers in Remy Magnetos and the facilities of the Remy plant in Anderson, Indiana. It means that factory heads, responsible for returns from financial investments totaling one half billion dollars, put their stamp of approval on the new Remy Magneto. These men are ready to trust their entire 1913 productions and business reputations to the performance of the new Remy.

And these builders in making their choice consulted more than 10,000 automobile dealers throughout the United States. They, too, approved the Remy.

Each of these groups of engineers, manufacturers and dealers feels secure in buying Remy quality. The engineers know the Remy stood their punishing tests; the manufacturers know the Remy from its inception; the dealers know the Remy as having made good on more than 300,000 cars during the last fifteen years. All of these groups know that the Remy is the simplest ignition device made; that this simplicity is backed by Remy Magneto Service for Users, Dealers and Manufacturers.

There are more than fifty Remy branches and service stations located in North American motoring centers for intelligent service to Remy users.

See that a new Remy is on the car you buy.

We have published a simple explanation of magnetos in general and Remys in particular. It is written so that a school boy can understand it. Copy to you on request.

Exchange your old magneto (any make) for a new 1913 Remy; it will cost you practically no more than repairs on your present ignition system.

See the Remy Starting, Lighting and Ignition Exhibit at all the Automobile Shows.

THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 2 FEBRUARY 25, 1913 Price, $1.00 the Year

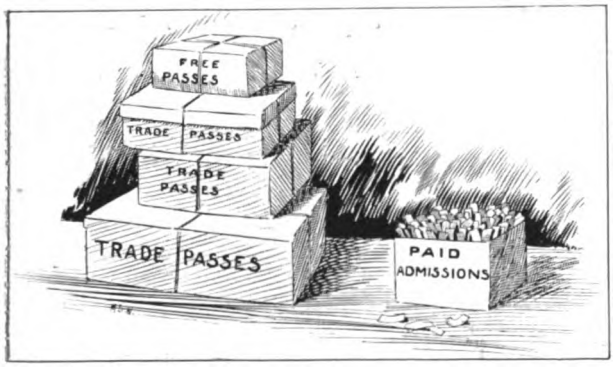
NATIONAL VS. DEALER'S SHOWS.

An Interesting Symposium, Presenting Opinions of Motor Car and Accessory Manufacturers and Others Relative to the Value and Importance of Each--- A Brief Review of the Horse Drawn Vehicle Show Situation.

DESPITE the unanimous action of the executive committee of the National Association of Automobile Manufacturers at a meeting held during the recent Chicago pleasure vehicle display, arranging for a 1914 show in that city on dates corresponding with those of the present season, the question raised by Albert L. Pope, president of the Pope Manufacturing Company, Hartford, Conn., in a letter to the motor car producers at the close of the New York exhibition, appears to be occupying the attention of the industry. It will be remembered that this letter suggested the advisability of abandoning national shows in the future.

The Motor Car Industry Is Seriously Considering the Show Situation.

The members of the committee present at the meeting were the following: W. E. Metzger, Metzger Motor Car Company (now a constituent of the Maxwell Motor Company, Inc., under the name of Flanders Manufacturing Company); S. T. Davis, Jr., Locomobile Company of America; H. H. Rice, Waverley Company; H. O. Smith, Premier Motor Manufacturing Company; Charles Clifton, Pierce-Arrow Motor Car Company; Hugh Chalmers, Chalmers Motor Company; L. H. Kittredge, Peerless Motor Car Company; W. C. Leland, Cadillac Motor Car Company; S. A. Miles, general manager, and J. S. Marvin, traffic manager.



Digitized by Google

Mr. Pope's Letter to Manufacturers.

Mr. Pope's letter has had the effect of causing serious consideration of the entire show situation. "I have thought it over from every standpoint," reads his letter, "and wondered in my own mind how long this industry of ours could stand such expense as automobile shows in general entail." Mr. Pope continues as follows:

"The past week I have been more impressed than ever at the Madison Square Garden show as to the matter of expense, for the automobile industry in general pays for it. Last year I understand gate receipts paid by the public at Madison Square Garden were only 40 per cent. of the total. It is too early at this writing to say what they will be this year, but in all probability they will be somewhat less. The trade in general paying for and giving away the tickets not only pays the rent and decorations, but a large part of the patronage as well.

"The disorganization of your factory and

Gate Receipts Paid by the Public Only 40 Per Cent. of the Total—Albert L. Pope.

sales department and business in general during the weeks of the show is a serious matter and I think one that will have to be reckoned with in the near future by the automobile industry. The money in addition that is left with the hotels in New York and other cities is another serious point.

"Now the situation resolves itself right down to this: Can the automobile industry stand the expense of these shows with all its ramifications?"

In the remainder of the letter, which was published in full in the last issue of The Automobile Journal, Mr. Pope calls attention to the advisability of discussing the question from all points of view, and to the necessity for taking prompt action, if for any reason it should be deemed wise by a majority to discontinue shows, because in the very near future the association would be making leases and arrangements for shows in 1914. Those who felt as he did, that shows should be discontinued, or at least, that the matter should be thoroughly discussed by the manufacturers, were invited to write the N. A. A. M. requesting that a meeting be called for this purpose.

Mr. Miller's Suggestion.

Following Mr. Pope's letter was an announcement by Chas. E. Miller, New York City, the pioneer accessory man, suggesting that the national New York show was now such in name only, because all the products have been shown and in use for months previous to the opening of the displays. "Hence," said Mr. Miller, "the exhibitions themselves are no longer maker's shows, but dealer's shows; who retail directly to the user." He added:

"If the New York exhibition were a local show like the big Boston display, the local dealers, branch houses and jobbers in supplies could control it. Then the show could be held in one building, the profits going directly to the dealers, for certainly the makers have no license to be in the show business for profit. All the makers would need to do would be to furnish the sample cars and do the big metropolitan advertising.

"The motor business wagon show should be held out-of-doors, in the late summer or early fall, so that practical demonstrations of loading and unloading, for example, could be held. This would indicate the real value of the product to the intending purchasers."

Believing this matter of decided importance to the industry as a whole, The Automobile Journal has requested expressions of opinion upon the subject from manufacturers of cars and accessories, show managers and others. Among those from whom replies have been received is Alfred Reeves, general manager of the Hartford Suspension Company, Jersey City, N. J. Inasmuch as Mr. Reeves has been identified prominently with the show committee in charge of national displays in New York City for some years, his opinion cannot fail to be of interest. His letter follows:

Alfred Reeves States Position.

Acknowledging your recent letter on the subject of the holding of automobile shows, beg to state that the attitude of this company is that national automobile shows of the highest possible character, as have obtained during the past 10 or 12 years, should be continued in New York and Chicago, just as long as the general public shows a readiness to come in increasing numbers each year and pay 50 cents admission to see what we, as manufacturers, have to sell them.

I think the question of a continuance of automobile shows will be best answered by the attendance or non-attendance of the public and every year has seen an increase in attendance.

As to the cost of shows, they generally cost exactly

Digitized by Google

what the manufacturer will permit his company to spend. The cost of space is almost all returned in one form or another; while the manufacturer should look upon the show as a business proposition and have his employees conduct themselves accordingly.

I don't believe that the dealers could afford to put on a show equal to what New York and Chicago has expected and received during the past few years, when to some degree, a part of the expense was borne by the manufacturers.

It may be that the time to retire is when one is at the highest point of their career, in which case, this year or next would be the time for the shows, but it would have to be by mutual agreement on the part of all manufacturers, else shows not so representative in character might be held to the detriment of the automobile industry's reputation.

There is not an industry in this country today that would not be willing to pay many hundreds of thousands of dollars to have the same keen interest by the public, as well as the dealers, in an exhibition of their product as is favored the annual motor car exhibition.

I believe the national show, as well as the local show, will gradually be eliminated as interest in those affairs cease among those who buy.

Yours truly,
HARTFORD SUSPENSION COMPANY,
By ALFRED REEVES, General Manager.
Jersey City, N. J., Feb. 18.

It would appear that several manufacturers have accepted Mr. Pope's invitation to address letters to the National Association of Automobile Manufacturers. Among these is the Inter-State Automobile Company, a copy of the letter being as follows:

Inter-State Enters Protest.

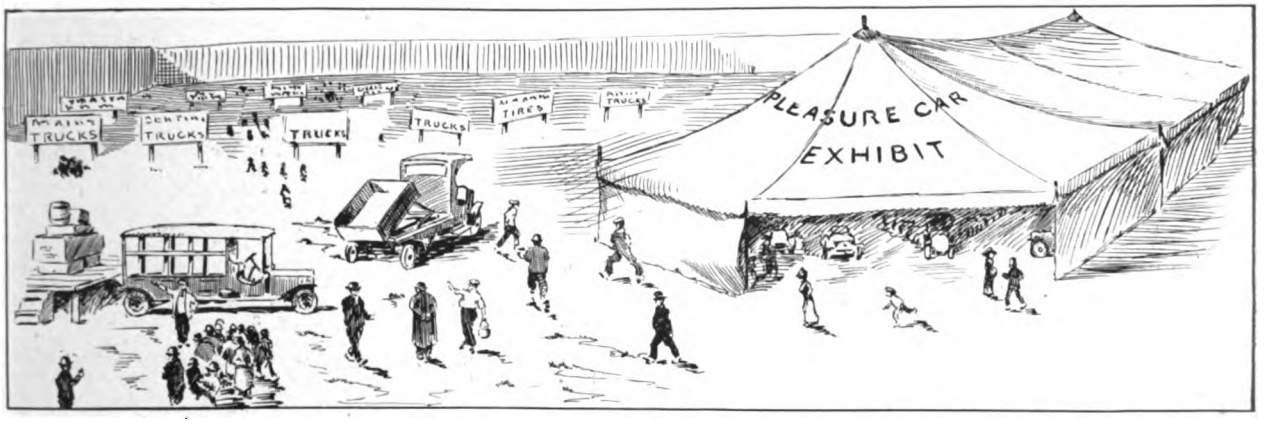
For the past few years we have been making a study of the National Association exhibits held at New York and Chicago. We are led to believe, from what experience we have had, that these shows are not worth the money expended.

We find it almost impossible to sell cars for 60 to 90 days previous to the holding of these shows. This works a hardship on the manufacturers. The expense entailed in preparing the show jobs for exhibition in our factory demoralizes production.

The price we pay for show exhibit space is exorbitant. The men we have in attendance at these shows and the money they expend is another item to be taken into consideration seriously.

These shows are held during the very bad weather and there is a great deal of exposure. The unventilated rooms, overcrowded condition of the show rooms is not beneficial to health. The holding of these shows breaks up our production and selling organization for two or three months in the year. We find that the agents and contemplated agents visiting these shows are bewildered at what they see and cannot come to a decision.

A very great majority of them go to the cities to have a good time and they have it, and little or no attention is paid to actual business. Taking all these things into consideration, we believe it would be well to discontinue the annual exhibits.



We would like very much to learn that our protest against these shows, together with protests that you may receive from others, have your very careful consideration.

Yours very truly,
INTER-STATE AUTOMOBILE COMPANY,
By ————————, President.
Muncie, Ind., Feb. 11.

Some concerns have preferred to address their replies to Mr. Pope. W. C. Shepherd, receiver for the Matheson Automobile Company, Wilkesbarre, Penn., is one of these. Mr. Shepherd takes up a number of conditions, which he discusses as extravagances, and among these he classes the show business. Upon this question he writes as follows:

Show Period as "Marking Time."

The show marks a period of the year which can be described as "marking time." It gets one nowhere, costs a large amount of money, interrupts manufacture, challenges competitive companies, is an acknowledgment to the general buying public of a willingness on the part of the manufacturers to compare and change or add to. It is notice to the dealer of a cessation of business until he can be shown the latest and best—or worst—of the industry, and instead of being an incentive to the dealers is oftentimes a disappointment because of the fact of the carrying over by them of a number of cars which the manufacturer has depreciated by the new exhibit, and in fact the show is handed down from the early period of the industry. It has served its purpose and no longer is it wise or businesslike to continue. It is neither worth while nor desirable since the standardization of motor cars to exploit or exhibit refinements and details at such a frightful cost of time and money.

Suggestion for Out-Door Summer Show as Made by Chas. E. Miller and Amplified by Forrest M. Keeton.

The practise obtaining in the automobile industry of distributing thousands of dollars' worth of tickets free to anyone who wished them gives a false import to the interest shown in the industry. Since I have been connected with this company I have stopped this practise.

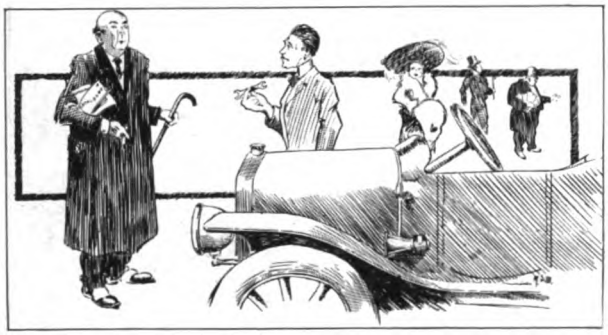
The shows, as you say, simply form a stimulus for advertising in all directions, in newspapers and publications, which already has passed a point where wisdom and commonsense no longer rule, and where the automobile industry stands challenged from every standpoint of economy and good business as exhibiting a great waste of money, great extravagance through a multiplicity of advertising mediums and the immense amount of money spent in making known to the public what it has to sell. No business on earth would stand such expenditures—and neither will the automobile business stand it.

Digitized by Google

The letters received indicate that the subject as presented both by Mr. Pope and Mr. Miller has received serious consideration. They make an interesting symposium of the situation. Some of those written by automobile manufacturers are given below:

Agrees with Mr. Pope.

Mr. Pope has expressed the sentiment of the Warren Motor Car Company, with reference to the discontinuance of the national shows. While we have not heard all of the arguments and have not given the matter a great deal of consideration, still we feel that the manufacturers or the dealers should conduct all of the shows, in which event the expense incident to an exhibition would be greatly reduced.



Yours very truly,
WARREN MOTOR CAR COMPANY,
By R. W. ALLEN, General Manager.

Detroit, Mich., Feb. 11.

Wants Dealer's Shows.

We are in favor of discontinuing national shows and allowing dealers to conduct the shows in New York City and in Chicago as they do in other large centres. We received a letter from Mr. Pope some weeks ago and replied favorably to it.

Manufacturers as a rule now present their new models in June or July and contracts with dealers are

Models Shown Are for Most Part Those Which Have Been on the Streets for Months—M. J. Hammers.

as a rule generally closed by the first of September, and thus it cannot be expected that there will be much dealers' trade at a show held in January or February. We did not exhibit at New York this year, but did at Chicago.

Yours very truly,
THE BARTHOLOMEW COMPANY,
By G. G. LUTHY.

Peoria, Ill., Feb. 10.

Would Abandon National Shows.

Beg to state that this company takes the stand that they would be very glad to see the national shows abandoned, and that the same be carried on by the dealers in the different cities.

We have not been in favor of these shows at any time, and the sooner they are abandoned the better we think it would be for the manufacturers.

Very truly yours,
JAMES CUNNINGHAM, SON & CO.

Rochester, N. Y., Feb. 10.

Shows Not Particularly Beneficial.

Will say that the directors of our companies have had no recent discussion as to the merits of the present system of automobile shows. The writer can, therefore, only speak for himself.

I have watched the recent shows very carefully, and have arrived at the conclusion that they are not particularly beneficial to the automobile manufacturers except in an indirect way. I would not care to discredit the entire system, but do not believe that the New York and Chicago shows differ in any respect from the Boston, Philadelphia or other shows of that class, and I believe the time is near at hand when the New York and Chicago shows will be treated exactly as automobile shows are treated in other cities; that is, merely as a means of boosting the dealer's business locally.

Very truly yours,
REO MOTOR CAR COMPANY,
By H. M. SNYDER, Secretary.

Lansing, Mich., Feb. 10.

Discontinue All Shows.

These shows have been not only a source of great expense to the manufacturers, but their business has been interrupted by so many of their employees being away attending them that, in our opinion, it would be to the advantage of all concerned if all shows were discontinued.

We do not agree that it would be advisable to discontinue the New York and Chicago shows, or run them on a different basis, and continue the local shows. In our opinion if any shows were held at all, they should be the two national shows; or better still, only one national show; or still better, no shows at all.

Yours truly,
D. McLAREN, Receiver,
COLUMBUS BUGGY COMPANY.

Columbus, O., Feb. 10.

Change Might Create Greater Evil.

I have yours of Feb. 6, and note your reference to Mr. Pope's letter. On the whole I believe it is a good proposition, and in some ways it will probably work serious harm.

As manufacturers we have been forced to take the position that we could not make any show otherwise than at New York and Chicago. Local dealers in all towns have prevailed on us, urged and insisted that we should help them at their local shows, that we should either pay for the space, send our representative or do something. We have held to the opinion that we promoted the national show, or helped to, and did not feel that we could go farther. Now, if we elliminate the national shows we feel that the expense will be far greater. At the present time shows work very well for the industry, they keep up the interest and we are enabled to sell a volume of work through this interest.

It is further questioned as both of these large cities would continue to have a show if not under some national organization, at least controlled by a local organization, so that I do not know that anything special would be gained in eliminating the national show and putting it into private ownership. In several cities where they started out with a show you will notice that they have run counterwise and the result has been two shows, and this does not always work out to the best interest of the industry or the exhibitor.

So on the whole canvassing the situation with some serious thought we believe if it is an evil we have, better meet the evil other than change it so it may grow into a greater evil.

Respectfully,
W. H. McINTYRE COMPANY.

Auburn, Ind., Feb. 11.

Something to Be Said Both Ways.

This is one of those subjects about which "there is much to be said on both sides." The Chalmers company have found this year's shows in both New York and Chicago very profitable. The national automobile shows seem to have lost none of their drawing power, and our sales this season were far in advance of any earlier show season.

However, the suggested alternative might give even better shows. Dealer's shows are conducted with great success in Buffalo, Detroit, Minneapolis, Cleveland, Omaha, Kansas City, Boston, Philadelphia and a great many other cities.

It is really rather early to say which type of show is most productive of business. Of course, the national shows hold the records at the present time, and it is hard to judge if a dealer's show in New York or Chicago would do better business, because such shows have never been held there.

Very truly yours,
CHALMERS MOTOR COMPANY,
By LEE ANDERSON, Advertising Manager.

Detroit, Mich., Feb. 10.

Digitized by Google

Makes but Very Little Difference.

I do not see that it makes but very little difference to the average manufacturer whether the New York and Chicago shows are called national shows or dealer's shows. Nearly all of the prominent companies have branches in those cities, and I feel quite sure that the preponderance of branches is so great that the dealer would in most cases induce the manufacturer to pay practically the same expense that he pays today. I do not believe in discontinuing the pleasure car shows, but I am not so sure in regard to truck shows.

Yours very truly,
L. H. KITTREDGE, President,
PEERLESS MOTOR CAR COMPANY.
Cleveland, O., Feb. 11.

Willing to Give Bond.

Wish to say that we heartily agree with Mr. Pope's suggestions to abandon the shows; in fact, they should all be abandoned, not only by the manufacturers, but by the dealers. We do not favor any show. It does not protect the manufacturer in any way. He is compelled to wait until the spring of the year for half of his customers to make up their mind as to what car they desire to buy and all of them wait for the show, or at least the greater part of them. Besides it is a great source of expense that is unnecessary.

We would be only too glad to give bond not to make a show in the United States if other members of the National Association will do likewise.

Yours very truly,
WESTCOTT MOTOR CAR COMPANY,
By H. L. ASHLEY, Secretary and Treasurer.
Richmond, Ind., Feb. 10.

Expense Disproportionate to Returns?

I must say in reply that the suggestion to abandon the national shows in New York and Chicago has been given serious thought for some time by the officers of the Cutting Motor Car Company.

In our selling organization we have never considered it feasible to economize too strictly in a matter of placing our car before the public in a satisfactory light, and at the same time helping each of our agents to place his proportion of our product.

The question has arisen in our minds as to whether or not the expense the manufacturer is subject to in exhibiting at New York and Chicago is out of proportion to the returns received. We feel that this matter should receive serious consideration at the hands of a committee from the National Association who are best qualified to judge, and we hope in the near future such a meeting will be called.

Yours very truly,
CUTTING MOTOR CAR COMPANY,
By W. W. CLARKE, Secretary and Treasurer.
Jackson, Mich., Feb. 13.

Interfere with Deliveries.

We, as manufacturers, are in favor of abandoning the shows, as we feel that the expense is entirely out of proportion to the good resulting therefrom. It not only costs a great deal of money to show in New York and Chicago, but at the same time entails considerable incidental expense, which we feel could be very easily dispensed with. Coming as they do in the very busiest time of the year, the national shows tend to disrupt our manufacturing and sales forces, and seriously interfere with deliveries.

The amount of money expended for shows throughout the country each year is enormous, and we think that even the dealers could apply same to the promotion and development of their business in a much better way. We have expressed these sentiments to all inquiries this season, and shall certainly stand by them if the matter is brought to an issue by the National Association of Automobile Manufacturers, which body is now seriously considering the matter.

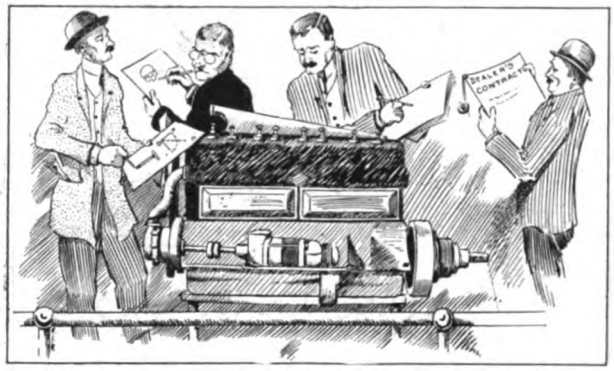
Yours very truly,
KLINE MOTOR CAR CORPORATION,
By CHAS. E. SWEENEY.
Richmond, Va., Feb. 11.

More Good from Local Shows.

We wish to express our views to you in regard to the holding of national shows in New York and Chicago.

There seems to have been a growing disposition to discontinue the shows. We are heartily in accord with some change being made. The manufacturers have their output all sold months before the shows are held, either in New York or Chicago, and it causes a disruption of business, as the dealers will hold off placing their specifications until after they have been to the shows, we believe more as a pretext, and when the shows come, very seldom do they place their orders. The factories are demoralized for months before the shows come and the organization is entirely disrupted; the sales department is at a standstill, and we believe, taking it all in all, that it would be better for the business if there were no national shows held.

Then, the expense seems to be enormous, as all advertising mediums make life miserable for the manufacturers just before and after the shows. This, of course, is a secondary consideration.



We believe more good can be done by holding local shows in the vicinities of the large dealers. Then they will get the direct advertising. We do not wish to be understood that there is no good comes from the automobile shows, for there is along certain lines, but we believe they have served their usefulness, and we certainly trust some methods will be used to discontinue them and adopt some other methods of advertising.

Very truly yours,
JACKSON AUTOMOBILE COMPANY.
Jackson, Mich., Feb. 11.

Did Good Business at Chicago.

We have your letter in regard to the abandoning of the national shows in New York and Chicago. Our position in that matter is as follows:

We have never been able to secure a great deal of

Show Provides a Meeting Place for Designers, Officials, Etc.—Perfection Spring Company.

business through the New York show. For that reason we have not been represented there for the last two seasons. We were represented there for the two years before that, however. We think possible our inability to secure a paying business at the New York show is largely due to the fact that we were not represented through the East sufficiently. However, we will be compelled to exhibit at the New York show next season, if one is held, because of the large number of dealers we now have in the eastern states.

Now with reference to Chicago show, we would dislike to see this exhibit discontinued as it is certainly a place to get business. We have just returned from last week's show in Chicago with four times the business that we ever received at the shows, and of course, this is sufficient reason for us wanting the Chicago show continued, and in addition to this we have just written Mr. Miles favoring the 10-day plan instead of the week.

We do not believe that we could spend the same amount of money and get the same returns in any other way.

Very truly yours,
CROW MOTOR CAR COMPANY,
By M. E. CROW, President.
Elkhart, Ind., Feb. 11.

Waste of Money to Exhibit.

We wrote Mr. Pope in answer to his letter, stating that so far as we were concerned we would be glad to see the automobile shows eliminated entirely. Not only do

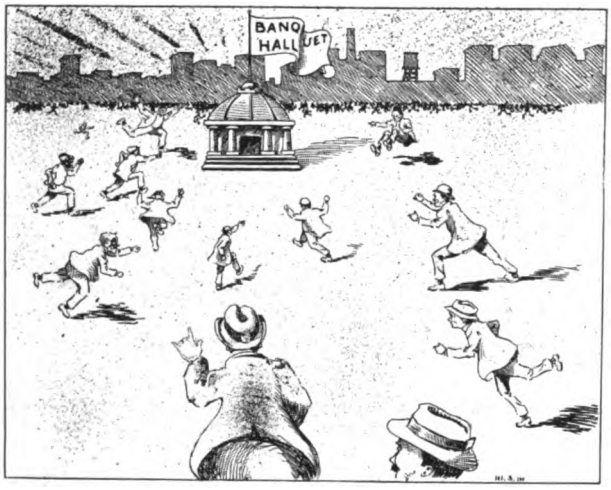
Digitized by Google

we refer to national shows in New York and Chicago, but all other shows as well.

Most manufacturers maintain expensive quarters for show rooms where it is convenient for prospective buyers to call and look over their line of cars, and we think it is only a waste of money to exhibit at automobile shows.

Yours truly,
J. I. CASE THRESHING MACHINE COMPANY,
By C. J. FARMER, General Sales Manager.
Racine, Wis., Feb. 18.

Favors Continuing National Shows.



Without going into details as to the why's and wherefore's of the matter, this company is strongly in favor of the continuation of the two national automobile shows, one in New York and one in Chicago.

Very truly yours,
CADILLAC MOTOR CAR COMPANY,
By K. P. DRYSDALE, Advertising Department.
Detroit, Mich., Feb. 13.

Costs Too Much Money.

We have your favor in reference to automobile shows. This letter reached us in the absence of the writer, who was attending the Chicago show. We are of the opinion very firmly that if the trade ceased holding these shows they would be many thousands of dollars ahead every year.

Our show expenses this year are about $30,000, which

A Great Majority Go to the Cities to Have a Good Time and They Have It—Inter-State.

looks awfully extravagant, and we know there are other concerns of about our size and capacity that have spent $20,000 more than we did. It wonders the writer that the automobile buyers and users have not criticised the automobile builders as being a lot of spendthrifts because this is beyond any reason or sense.

We have about come to the conclusion that, if automobile shows will be continued by the association or not, we will quit and that we will entertain our dealers nicely here in the factory for a week or two early in the season, where we will have goods to show, our factory in operation, and they can see how our goods are being made. We believe a week of this kind will be much more educational to the dealer than anything you can do for him. To give you our positive and ending opinion, the show business costs too much money and we want to withdraw from any further shows.

Yours very truly,
IMPERIAL AUTOMOBILE COMPANY.
Jackson, Mich., Feb. 11.

In addition to the letters received, Forrest M. Keeton, president of the Keeton Motor Company, Detroit, has issued the following in the form of an interview:

Favors Summer Display in Detroit.

I believe that there should be no let-up in the matter of shows or contests, and I believe still another show should be added to the list, and that a summer exhibition to be held at Detroit, as 80 per cent. of the automobiles are made in Michigan. It is during the summer that the new models come out, and at the time of the national shows most manufacturers have gotten out their cars many months before and agents have disposed of a large proportion of their outputs. I speak not only for the pleasure car makers, but for the truck manufacturers in this matter.

The show for dealers held in the summer would bring together thousands of agents at a time when agency contracts are made. Providing this show could be held at a place like our Michigan state fair grounds in Detroit, demonstration trips could be held on the track and contests on the roads surrounding Detroit, all of which would be to the best interests of the exhibitors.

The commercial vehicle section, to my mind, should be an out-of-door display, or at least the cars should be shown under tent covers, but in position to be run out at any time for a road demonstration. The state fair grounds have roads within the grounds and on these the trucks could be made to show their paces. The pleasure car sections would then be located in the great fair buildings and grouped according to class, the electric cars in one building, the gasoline pleasure cars up to a certain price in another building and so on.

There is room to exhibit every make of car in the United States and more room could be gained by the erection of a big tent, such as was used for the Indianapolis show of last spring. Given such a show as this, with all buildings connected with a covered passageway, and the industry would have an exhibition at which the amount of business transacted would be enormous and amount to more money in one or two weeks than is totalled at all of the automobile shows held during the winter. The present shows are grand advertising and should be continued, but the country wants a trade show, and I believe that there should be one and at Detroit. I shall do all in my power to help along such a cause.

M. J. Hammers, general manager of the Abbott Motor Company, Detroit, also issues an interview, a part of which is given below:

Nothing New to Be Shown.

That the annual automobile shows as now conducted, especially the New York and Chicago events, have lived their day and fulfilled their original purpose, is the absolute conviction of the majority of automobile manufacturers. Until the past few weeks few people with authority and influence have felt free to publicly express their views on what heretofore has been considered a delicate subject.

The necessity of these events has ceased to be a fact. During the earlier days when the industry required all the encouragement and assistance that could be given it, they were unquestionably a good thing, but the public attitude has changed and the day of educational campaigns to teach people the utility and commercial value of the motor car has passed. The business of manufacturing automobiles has attained such proportions that it ranks in both stability and importance with other great industries. There is now little more logic in holding these periodical exhibitions than would justify a similar display of railway coaches and street cars.

A few years ago we had "shows" in a very acceptable sense of the term, but not so any longer. Then the new models were not made known until they were displayed at the New York show, but now practically all manufacturers are announcing their respective lines not later than August, and many have ceased to make these announcements altogether. Anybody with any degree of interest now attending these shows well knows just what he will see. The models shown are for the most part those which have been on the streets from six to eight months.

After as careful analysis of trade conditions as possible, I have been unable to discover any real demand for the annual show. The situation seems to be that while the majority of manufacturers have had their own private convictions in the matter, each has disliked to be the first to take a definite step, not knowing for a certainty in just what light their position might be regarded.

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

It is my firm belief that the time has come when the industry can abolish the matter of automobile shows in New York and Chicago in the winter time without suffering anything in the way of reduction in the total amount of automobile business done in the country. If in the opinion of all manufacturers an automobile show should be held it should be held in the summer season at about the time the manufacturers introduce their new models, and hold just one show, and that at some point outside of both New York and Chicago, preferably Detroit.

W. L. Kissel, secretary of the Kissel Motor Car Company, Hartford, Wis., thus describes his attitude in an interview:

Local Shows More Important.

It is all wrong. If the shows were held in the summer when the new models are first announced, there might be some excuse for them, but as a matter of fact, they come so late that very little is shown that the public has not already become perfectly familiar with. Of course there is a great deal of business transacted at these annual "round-ups," but when you come to analyze it, it appears very doubtful whether much of it is business that was not headed your way regardless of the shows.

Relieved of the responsibility of the New York and Chicago exhibitions, the manufacturers could lend more aid and encouragement to the dealer's shows in the smaller cities. These shows are becoming more important every year and their success is a fine tribute to the ability of the dealers and the best possible indication that the dealers of New York and Chicago would be successful in managing any exhibitions that might be arranged in those cities.

I do not care to have this construed as a reflection on the management of either of the national shows. It has in both cases been very able, but I do think that as a national affair the show has survived its usefulness.

The members of the Motor & Accessory Manufacturers, and other accessory houses, also are interested, as is evidenced by Mr. Miller's statement. They have made display as an organized body at the New York, Chicago and Boston shows. The opinions thus far received from these concerns are quite as diversified as those presented by the automobile manufacturers. Some of them are given below:

One Exhibition as Substitute.

We are inclined to think that a show at New York and Chicago is a considerable advantage. It has some tendency to unify the industry, and provides a universal meeting place for a great majority of designers, officials and those directly responsible for the success of the industry.

We are further inclined to believe that if the national shows are dispensed with, local shows will take the place, and will not afford the opportunity for the interchange of opinions and social intercourse that is made permissible by the national shows.

If, as a substitute, one national show could be held either in Michigan or Ohio, thereby affording a central location, it would seem a very acceptable substitute for the New York, Chicago and Boston shows. A show in a central location, however, and substituting this show for all others, would of necessity continue for a greater length of time than any of the national shows now being held.

Replying to your first question, we believe that our interests are best served by national shows, such as held at New York and Chicago.

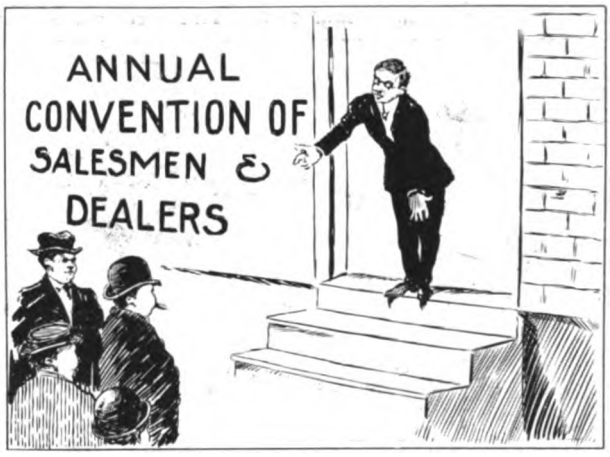
Second, we believe it is not possible nor commercially feasible to exhibit at all the local shows throughout the country, and until some better plan has been devised, we favor the continuance of the two national shows.

Respectfully yours,
PERFECTION SPRING COMPANY,
By CHRISTIAN GIRL, Manager.
Cleveland, O., Feb. 15.

Dealer's Shows a Valuable Stimulant.

We are glad to note your early interest in the important subject. There is no question but that the national shows have largely served their purpose except that they give an excellent chance for newer lines to be introduced, and we believe that instead of combining as is at present done, there will be a much larger national showing of new models and accessories, allowing a longer season of selling goods, instead of holding up for months products awaiting winter shows.

The writer has attended bicycle and automobile shows for 20 consecutive years, and I believe is qualified to opine that the national shows are held too late, but that from Jan. 1 on, dealer's shows in all cities of any size above 50,000, will prove a valuable stimulant to the business and favorable to the trade, and that local agents and representatives will see to it that their factories give them some support in showing wares.



The whole problem, of course, is open to argument, fitting various cases, as it is now held. We sell only to manufacturers and jobbers and the season in which all shows are held is far too late for us to find either class open for business.

We hope to see much earlier shows in Chicago or Detroit and then later, dealer's local shows.

Yours very truly,
SMALLEY DANIELS.
Detroit, Mich., Feb. 14.

Trade Comes to Manufacturer.

We are well satisfied with the present rule of the association restricting its members to exhibits at the national shows at New York and Chicago and the local dealer's show at Boston.

A Trip to the Factory Would Give More Points to the Dealer—E. A. Kruse.

While we have usually secured good results from our exhibit at the Boston show, we would be in favor of limiting the exhibits to the national shows were the Boston show to be used as a precedent to influence the association to countenance exhibits by its members at other local shows.

We do not doubt that any jobber of accessories would be very glad to have as many as possible of the manufacturers of the goods he distributes exhibit at the local shows in the territory he covers. Experience has proven to our satisfaction, however, that the expense entailed by the manufacturer in endeavoring to go to the local trade by exhibiting at local shows is in no way commensurate with the returns.

On the other hand, at the national shows the trade from all over the United States, as well as from numerous foreign countries, comes to the manufacturer.

There is also a dignity and enthusiasm connected with the national shows which we believe has been an important factor in the rapid advancement of the automobile and allied industries.

The dignity and enthusiasm of the national shows is a great contrast to the conditions which prevail at most of the local shows, many of which are so poorly managed and so deficient in nearly every respect that they

Digitized by Google

are far from being either a credit or a benefit to the manufacturer displaying his goods, or the industry in general.

Very truly yours,
C. A. SHALER COMPANY,
By ROBERT B. DUNLAP.

Waupun, Wis., Feb. 13

Local Shows More Satisfactory.

Replying to yours regarding national automobile shows in New York and Chicago, would say that as this is our first year in business, we naturally are not in position to express an opinion regarding value of these shows from a business standpoint.

From the writer's personal experience he is inclined to believe that local shows under the auspices of dealers' associations will be as productive of business as the larger affairs; in fact, will be more satisfactory from every standpoint.

Yours very truly,
MARATHON TIRE & RUBBER COMPANY,
By F. KESSER, Sales Manager.

Cuyahoga Falls, O., Feb. 14.

Have Outlived Their Usefulness.

Would say that we are heartily in accord with Mr. Pope's ideas. We believe that the national shows have outlived their usefulness and according to our opinion there is not a single exhibitor at these shows, except possibly some who have a radically new article to present, who can obtain benefit anywhere near in proportion to the cost of exhibiting.

Before we heard from you, and in fact before we heard of Mr. Pope's letter, we were considering the advisability of discontinuing our exhibit at the shows next season, and we were very much pleased to find that there are others

Co-Operation of Manufacturer and Dealer Would Result in Better Returns—T. O. Probey.

besides ourselves realizing the conditions. We feel that there can be no question that the shows which do not bring immediate sales are unprofitable and we think that almost every exhibitor at these shows will admit that he cannot make any great number of sales there, and that what sales are made would in all probability be made even if he were not an exhibitor at the show.

When automobiles were new and there were many new features and accessories pertaining to them, an automobile show was valuable, but at the present time when practically everything exhibited there has been exhibited many times before and has been advertised and called to the attention of the buyer for a very long time, the shows have no usefulness.

It is possible that the shows held later in the season when the public is ready to buy, and conducted by the dealers themselves, might be worth while, but we think that if the exhibitors would put the same amount of money and energy into advertising from their own stores they would probably get more business out of it.

In conclusion would say that it is our opinion that Mr. Pope is right in believing that the shows are an unnecessary drain on the automobile industry and we are heartily in favor of abandoning them.

Yours very truly,
LEATHER TIRE GOODS COMPANY,
By C. B. WOODWORTH.

Niagara Falls, N. Y., Feb. 15.

Cartage Only Local Show Expense.

We would give our opinion that for our benefit only the holding of national shows as heretofore has not been of great benefit to ourselves as wheel manufacturers. Nor do we think the holding of local shows would be of much benefit to us. The situation between the accessory man and the automobile manufacturer is very different.

They have their local branches, and all expense they would need to have would be the transfer of stock of the local branch to the building in which the local show would be held—all the expense being a matter of cartage. The benefit so derived by the local branch would be to the benefit of the manufacturer.

Yours truly,
PHINEAS JONES & CO.,
By HENRY P. JONES, President.

Newark, N. J., Feb. 12.

Willing to Stop Exhibiting.

If the automobile shows, at which members of the Motor & Accessory Manufacturers exhibit, were discontinued entirely, we would be very glad to stop exhibiting. We do, however, think that they are a benefit in a great many ways to the parts maker, but they are a great expense and the expense is hardly justified from our point of view.

Yours very truly,
ROSS GEAR & TOOL COMPANY,
By EDWARD A. ROSS, Secretary.

LaFayette, Ind., Feb. 17.

Glad to Have Them Discontinued.

Would say the nature of our business does not require us to exhibit at auto shows, either national or local. We have only taken part in the New York and Chicago shows, simply because the others have done so, and we would be glad to have them discontinued. We have never exhibited at local shows at all.

Yours very truly,
BROWN-LIPE GEAR COMPANY,
By H. W. CHAPIN, General Manager.

Syracuse, N. Y., Feb. 12.

Local Shows Cost More Money.

I always believed in advertising and exhibiting the products which you make. Of course I do not believe that holding local shows similar to the ones in Boston, New York and Chicago, would be a great advantage to the manufacturer. However, I think in my judgment, it would be almost impossible for any manufacturer to be represented in every local show.

In the first place the expense would be enormous to the manufacturer, and another reason, while we sell largely to jobbers, we would be under obligations to all of them to help them out by paying part of their expense at every local show where they would represent, therefore, I think it would be a great disadvantage to us, while it would be a big advantage to the local dealers.

Furthermore, if they would abandon the shows in Boston, Chicago and New York, we ourselves would not exhibit at all in local towns for the reason stated above. We would simply send our own catalogue to our trade to avoid the enormous expense of exhibiting at local shows.

Respectfully yours,
B & L AUTO LAMP COMPANY,
By N. BROWN, President.

New York City, Feb. 13.

No Additional Business Gained.

The writer is very much of the same opinion as Mr. Albert L. Pope and Mr. Chas. E. Miller relative to the advisability of continuing our exhibit yearly at the national automobile shows at New York City and Chicago. For a fact, we do not gain any notoriety, nor do we secure any additional business other than we get through our regular sales department.

We sincerely wish you hearty co-operation in the matter which you are handling at present.

Yours truly,
MUNCIE GEAR WORKS,
By L. J. STEWART, General Manager.

Muncie, Ind., Feb. 13.

Satisfied with National Shows.

On the show circuit of 1912 we covered nearly all the national and dealer's shows about the country, and were

Digitized by Google

convinced that for our product we could not profitably use any but the New York and Chicago national shows. Consequently, for 1913 we have exhibited at New York and Chicago during the national shows and have limited our exhibits to that extent. We believe that the dealer's shows about the country are fine in their ability to enthuse local interest in automobiles and accessories, but for our part are satisfied with exhibiting at the two national shows above mentioned.

Yours truly,
IGNITION STARTER COMPANY,
By GEO. P. SWEET, Secretary.
Detroit, Mich., Feb. 13.

Exhibitors Secure Practically No Return.

As to the value of the automobile shows to the exhibitors, would say that we agree with everything that Mr. Pope has said on this subject. We have exhibited at the national shows regularly for nearly 10 years and are convinced that, as far as direct results go, the exhibitors secure practically no return whatever for their tremendous outlay of time and cash, a part of which represents profit to the show promoters. Notwithstanding all stories circulated by the press agents, there is practically no business done at the automobile shows, and if the shows possess any value whatever to the trade it is simply to hold the interest of the general public. We shall be glad to see the shows abolished altogether.

Yours truly,
RUSHMORE DYNAMO WORKS,
By S. W. RUSHMORE.
Plainfield, N. J., Feb. 14.

National Show More Satisfactory.

We have found that both the New York and Chicago shows are very beneficial from our point of view, and the present method of holding the shows is, in our opinion, much more satisfactory than that of local shows, such as are held in Boston.

Yours very truly,
BUDA COMPANY,
By L. M. VILES, Treasurer.
Harvey, Ill., Feb. 13.

It will be admitted that the managers of the local shows are in a position to throw some light upon the situation, and here again there appears to be a difference of opinion. Some of the letters received from these men are appended:

Local Show Not as Productive.

In reply to your inquiry as to the relative merit of a national show or a local dealer's show in either New York or Chicago, would say that it is quite probable that a local dealer's show in either of these large cities would not be as big an affair nor one that would be as productive from a publicity or general advertising standpoint for the industry as the present shows have been.

Yours very truly,
NEW JERSEY AUTOMOBILE EXHIBITION CO.,
By C. E. HOLGATE, Assistant Manager.
Newark, N. J., Feb. 17.

Put All Cities on Uniform Basis.

My candid opinion is that national automobile shows should be abandoned, inasmuch as it is discrimination on the part of the manufacturer to select certain cities in which to hold their national shows, leaving the local dealers in the other cities to hold their own local shows at their own expense. I therefore feel that it is of far greater benefit to the industry as a whole to put all cities on a uniform basis.

Very truly yours,
BALTIMORE AUTOMOBILE DEALERS' ASSOC., Inc.,
By H. M. LUZIUS, General Manager.
Baltimore, Md., Feb. 15.

Public Would Be Benefited.

I believe that co-operation of the manufacturers with their local dealers in holding shows throughout the country would result in much better returns from all standpoints. My reason for such a movement is because I believe the dealer and his agents know the line, or should know it, thoroughly. Such being the case the public would be benefited by the broader scope offered with the manufacturer acting in concert with his local representative.

Very truly yours,
WASHINGTON AUTOMOBILE DEALERS' ASSOC.,
By T. OLIVER PROBEY, President.
Washington, D. C., Feb. 18.

Prefers State Shows.

Would say that the New York national show is of little benefit to the dealers in this far-off country, held at such a late date after the yearly models are in the hands of agents. I do believe, however, that there should be some way of bringing the manufacturer and dealer closer together.

In regard to the local shows, I believe they stimulate interest and enthusiasm that could not be obtained in any other way, but there should not be a show held in every small town, as they are doing this year. If the manufacturers would help support local shows, one in each state, held at about the same date, we would get better service. If these shows are not held at about the same time prospective purchasers would go to these shows and be inclined to wait until the last show before placing their orders, expecting to see something new or improvements.

Yours truly,
W. B. THOMBS,
(Manager Portland Show.)
Portland, Me., Feb. 14.

Suggests Dealer's Trip to Factory.

The writer is very much in favor of the local show project as he fully believes that more benefit is derived from the local show for the reason that our own customers and prospects come directly in contact with us and the factory men who are here, and will gladly come to a local show while they would not think of making a trip to New York or Chicago, unless they happen to feel in the humor.

Regarding the dealer's project, would say that we believe a trip to the factory would gain more points for the dealer than any automobile show could offer.

Therefore, we are of the opinion that if the manufacturers would lend more aid to all legitimate dealers, or in other words, those dealers who have handled their cars successfully for a number of years, it would be of great value to both the manufacturer and the dealer.

Very truly yours,
E. A. KRUSE,
(Of the Cincinnati Show Committee.)
Cincinnati, O., Feb. 18.

Local Sales Make Local Advertising.

In reference to the national show question—namely, New York and Chicago—the writer personally has attended every show that has ever been held in Madison Square Garden. We have watched its growth and have noted from a personal observation the amount of business attained from same, and the writer firmly believes that if the manufacturers would abandon national shows and would proportion the same amount of money that they stand at the national shows, which has developed into more of a get together than a business proposition, we are positive that the representatives of all the principal cities would be greatly benefited.

Taking Hartford as an example, the writer has given eight shows in the past eight years and in every instance the dealers or exhibitors have made a great many sales, and it is the means of securing hundreds of prospects who are in the market for cars. The bigger shows simply line up a few agents, who are slow in placing their orders, and dealers from all over the country attending them secure possibly one or two sales from their territory, but these same sales would be received at their own show, and would do them more good through local advertising.

Very truly yours,
F. W. DART,
(Chairman Show Committee.)
Hartford, Conn., Feb. 19.

Lack of space does not permit of reproducing all of the letters received, but those presented are sufficient to indicate the opinions of the industry. The subject of horse drawn vehicle shows is taken up on the following pages.

Digitized by Google

EXPERIENCE WITH HORSE DRAWN VEHICLE.

THERE is a suggestion, on the part of some car and accessory manufacturers, that the present situation with reference to shows is somewhat analogous to that which obtained in the horse drawn vehicle industry at one time. Probably few men are better able to give accurate information concerning this latter industry and its relation to the show problem than Herbert Longendyke, Troy, N. Y., treasurer of the Journal Company of Troy, publisher of the Carriage Dealers' Journal, the official organ of the National Carriage Dealers' Association. At the request of The Automobile Journal, Mr. Longendyke has prepared an interesting resume of the subject, which is presented below:

Horse Drawn Vehicle Shows.

The national horse drawn vehicle shows, unlike the national automobile shows, were strictly trade affairs, or market places, where manufacturers and dealers got together. Inasmuch as the vehicle industry itself was a staple one, with an ever increasing market, there was not that need for educating the public, through shows, that was very apparent in the automobile field with the advent of those machines.

It may interest you to know, however, that the manufacturing of horse drawn vehicles (especially in the pleasure class, such as buggies, surreys and the more luxurious types) in a wholesale way, in large factories, is of comparatively recent date. Speaking broadly, the years from 1870 to 1875 saw the development of the original, or pioneer, big factories. Prior to that time every city and town had its local "Brewster," who built mostly to order and sometimes took a chance on manufacturing a few vehicles ahead in anticipation of demand.

At first the big factories encountered a very strong prejudice against "factory work," which was supposed to be of inferior quality as compared with the built-to-order product of the smaller builders. The writer, who was formerly engaged in the wholesale carriage manufacturing business, remembers distinctly that such prejudice existed, in some degree, as late even as 1890.

Need for Dealers.

The large wholesale factories were immediately confronted with the problem of creating dealers, of whom there were none at first, since the trade had previously been in the hands of local or custom builders. Little by little, men with the instincts and abilities of merchants, were induced to become dealers in horse drawn vehicles. Some entered the business as dealers in nothing but vehicles, harness and the allied or accessory articles; others added vehicles, etc., as a department to their already established business.

These dealers not only had to overcome the prejudice against factory made work, and at the same time compete with the local builder of established trade and reputation, but were also confronted with another serious condition, which, by the way, has found a replica in the automobile trade; namely, the increase in the large wholesale factories resulting in the demand for more really bona fide dealers than existed, and compelling many of the factories to resort to the marketing of their goods as best they could. In consequence of this condition, many "curbstone" dealers were created and much selling direct to consumers at, or near, wholesale prices resulted. The inevitable consequence was that the bona fide dealers suffered keenly from the situation described.

National Association Formed.

Matters went along in this way for several years until the retail dealers found themselves conducting their business at an insufficient profit, and in 1889 a number of large dealers got together and formed the National Carriage Dealers' Association, the object of which was to secure the aid and assistance of the wholesale factories in abolishing trade evils, which were equally as detrimental to the manufacturers as to the dealers. The writer was at that time engaged in the manufacturing business and knows from experience what a detriment to the entire industry those conditions were.

The National Carriage Dealers' Association held annual conventions, which aroused a great deal of interest and a large increase in membership. The dealers saw opportunities for the betterment of conditions, and, in the main, were heartily supported by the manufacturers.

One of the first results of these annual conventions, which were at that time held in different cities, was that the travelling salesmen of the larger factories would be in attendance for the purpose of furthering their trade interests among the many dealers who were assembled. Almost immediately the brighter and more energetic salesmen began having samples, or specimens, of their goods shipped to the convention city and placed on exhibit in hotel lobbies, and in vacant stores near the convention hall.

Frequently, if these exhibited goods were not purchased by the retail dealers in the town where the convention was held, sales were made direct to consumers at, or near, wholesale prices so as to avoid the labor and expense of reshipping and recrating. It soon became apparent that dealers in the towns where conventions were held suffered from the facts related above, and the officers of the dealers' association soon saw that they must take steps to remedy that evil also.

Trade Convention and Exhibit.

They decided, therefore, that they must in some way control the exhibition of specimen goods, which was growing in volume every year. This led to an arrangement whereby in connection with the annual trade convention a trade exhibit was conducted under the auspices of the national association. Our publication, The Carriage Dealers' Journal, was then, as now, the organ of the National Carriage Dealers' Association, and the writer and his partner, Mr. C. C. Conant, were made managers of the details of the annual exhibition.

Immediately subsequent to that action of the national association the attendance at the annual conventions increased rapidly, as did the volume of exhibits. The attendance of dealers represented every state in the Union, and even foreign countries, and practically the entire wholesale manufacturing trade exhibited specimens of their products.

These affairs grew to such magnitude that in 1897 the dealers' association selected New York City as a permanent place for holding conventions, because it was the only city, at that time, with a building sufficiently large to hold all the exhibits. On two occasions the national association held its convention and exhibition in Philadelphia, and on two other occasions in Chicago, but New York City was usually the place selected.

Other affairs of like nature, though not so national in scope, were soon projected and carried to successful conclusions by local associations in Cincinnati and Kansas City.

At the annual shows, held at New York City, the attendance of dealers from long distances naturally represented the larger and more important dealers of large purchasing capacity. The smaller dealers, in the Middle and Far West, could hardly be expected to attend. When the carriage shows started in Cincinnati and Kansas City, these small dealers, who had not attended the New York shows, took advantage of the opportunity presented in these two other cities with great satisfaction to themselves and to the exhibitors. As a natural consequence the New York show became less national, and more of an eastern show, since the large dealers from long distances who previously attended the New York shows could attend the market presented by the Cincinnati and Kansas City shows.

Advent of the Automobile.

The advent of the automobile brought about a change of conditions in the East long before its effect was felt in the Middle West and Far West. For a few years the number of horse drawn vehicles consumed in the East diminished to a considerable extent, though, even now, the volume of horse drawn vehicles in the East is far greater than many people suppose or imagine. But there was a sufficient diminution in the number of dealers in horse drawn vehicles, as well as in the volume of business which each of them did, to make the national car-

Digitized by Google

riage shows at New York City no longer a business necessity and they were, therefore, discontinued.

Those held at Cincinnati and Kansas City are still running successfully.

Inasmuch as these carriage shows were primarily market places, and were held at a time when dealers were ready to place orders for the ensuing season, you will perceive that there is not an exact parallel between them and the automobile shows. There have never been any local shows of horse drawn vehicles, as the term is understood in the auto trade.

It is our belief, based on observation and experience, that the automobile shows have been a leading and potent factor in the development of the automobile industry. It is probable that the increase in the number of local auto shows may have lessened the value, or effectiveness of the national shows by reason of the lesser attendance of people from long distances. It is also possible that as a natural evolution the national shows may eventually become local shows, representing the cities where the national shows are now held and the territory immediately tributary thereto.

Carriage Shows of Great Value.

The carriage shows were unquestionably of great value and benefit to the trade, and proved to be an incentive to progress to the manufacturers, and a stimulus, as well as an educational feature to dealers. From years of close and intimate touch with dealers, and their own statements to us, both personally and in writing, we can say, unqualifiedly, that the carriage shows made the dealers more efficient as merchants, and gave a fillip and zest to them in their business, resulting in their marketing more goods and extending their business radius. This was due, not wholly to the shows, but also to their mingling at convention time with other dealers and exchanging ideas and views of business experiences.

The question of shows is one which will never receive a unanimous answer. In any line of trade there will be found many manufacturers who deny the value of shows and call them a useless expense. Still others will be found who admit their value and benefit, but question whether the results compensate for the cost and time. Still others take the view that shows are necessary evils, like certain other overhead expenses.

Our experience of over 15 years in conducting carriage shows, was that about 10 per cent. of the exhibitors were always big winners, and we found usually that those who made shows profitable were the ones who looked upon them as profit making opportunities, and planned and organized to that end.

The Trade Show Next.

If we might venture an opinion, we would say that it seems to us the next logical step in the automobile trade is a dealers' show, or trade show, held at a time of year which would be most satisfactory to both manufacturers and dealers. The co-operation of the dealers should be secured by making them, or their organizations, participants in the management and conduct of such trade shows.

The writer has on innumerable occasions heard automobile dealers express dissatisfaction at their inability to get the undivided attention of exhibitors at the present public shows. They realize, of course, that attention must be given to the public who are in attendance, but they do feel that a show where only manufacturers and dealers would be together would be much more satisfactory, especially if held at a time of year coincident with the buying or contracting season.

It is, of course, axiomatic that no industry can stand on a solid foundation unless the retail dealers are prosperous and making progress in a financial way. The most unfortunate condition in the automobile trade is that so few dealers are making money, or, to put it bluntly, that such a large percentage of them have "gone broke," or become dissatisfied through the realization of the fact that they are only about three jumps ahead of the sheriff.

Much of this is unquestionably due to conditions similar to those that once were prevalent in the horse drawn vehicle trade; namely, abundance of "curbstone" dealers who have little or no overhead expenses, and who form the most frightful sort of competiton for dealers with established places of business and organizations which necessitate certain fixed charges.

I speak from actual knowledge and not from theory. There is, of course, an inevitable annual weeding out of dealers who are among the less fit, but even the fittest could hardly survive under conditions which exist in the auto trade at present.

Very truly yours,
JOURNAL COMPANY OF TROY,
By HERBERT LONGENDYKE, Treasurer.
Troy, N. Y., Feb. 17.

RAY HARROUN'S CARBURETOR.

Company Organized in Indianapolis to Place New Device in the Market.

Ray Harroun, the well known racing driver, is the designer and manufacturer of a new carburetor which promises to bring him additional fame. A company has been incorporated and a plant that has already produced a number of the new carburetors is in operation in the Industrial building at Indianapolis, Ind., which will be the home of the industry. The equipment is designed to meet the new conditions faced at present by motor car manufacturers, especially as applied to the low-grade fuels.

The Harroun carburetor does not incorporate a water jacket. Air, heated by contact with the exhaust manifold is carried through the air jacket around, and then through the carburetor. This practically eliminates cold weather troubles, it is claimed, and makes possible the production of a good mixture with a very inferior grade of fuel. Mr. Harroun has closed a contract to furnish the carburetor to the Nordyke & Marmon Company, Indianapolis, who will use it on all Marmon cars in future. Other similar contracts are said to be pending.

Many persons have gained the impression that the new factory at Torrance, Cal., being erected at a cost of $100,000 for the manufacture of traction plows and motor trucks, is to be used by the Union Tool Company, near whose plant the new building is being erected. It is stated, however, by the Pacific Metal Products Company, which is already operating a $100,000 factory in addition to its other interests, that the new plant is building for that company's convenience in the manufacture of its new line of traction plows and motor trucks.

Since the announcement that the Speedwell Motor Car Company, Dayton, O., would give an option of its new rotary valve or a poppet valve motor in its 1913 Speedwell cars, orders have been received which necessitate the operation of the factory with day and night shifts.

MORE ABOUT THE NEW TIRE GUARANTEE.

SUPPLEMENTING the statements made in the last issue of The Automobile Journal by leading tire manufacturers with reference to the new tire guarantee adopted recently by the Motor & Accessory Manufacturers, additional letters are presented below. Owners have been particularly interested in the wording of the new guarantee, and the producers were asked to explain its effect upon the user. There seems to be difference of opinion regarding the matter, and while some clearly disapprove of a definite mileage guarantee others state that their understanding of the matter is such that change will be made in their past policy in this respect. In order that the continued discussion may be understood clearly the new guarantee is reproduced herewith:

We guarantee all pneumatic motor car tires, bearing our name and serial number, to be free from imperfections in material and workmanship. Tires returned for consideration under this guarantee will be accepted only when all transportation charges are prepaid. If, upon examination, it is our judgment that tires are defective, they will be repaired or replaced at our option.

When tires are replaced by us, charges will be made to owners at the time new tires are delivered, for such amounts as in our judgment will compensate for the service rendered by such replaced tires.

Tires worn out in usual or unusual service, abused knowingly or unknowingly, misused, used on rims not bearing these stamps (———) injured through accident or design, are not covered by this guarantee.

(Name of tire) pneumatic motor car tires are not guaranteed to give any definite miles of service, and any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights in excess of those for which the various tires are recommended, or who does not keep tires inflated to the pressure recommended by us.

It is understood that the Motor & Accessory Manufacturers contemplate making a more exhaustive statement of the situation in the near future, and some of the manufacturers, particularly those who are members of that association, prefer to await its appearance before discussing the matter for publication. Among the letters received are the following:

We wish to call your attention to the fact that there has been no change in the guarantee, with the exception that the guarantee does not apply, as in the case of our own tires, when any of the numerous substitutes for air are used, or when our pneumatic tires are applied to rims which do not bear the mark used for the protection mutually of ourselves, the car builder and the car owner.

There has evidently been a misunderstanding on the part of the car owning public as to mileage guarantee. While it is true that some tire manufacturers for their own convenience have taken in the abstract 3500 miles of service as a basis, there has been no guarantee that such a mileage would be given by the majority of manufacturers. It is true that one tire manufacturer openly advertises a guaranteed mileage of much greater than the above mentioned figure. That, however, is the individual policy of that concern, but speaking broadly, there has been no mileage guarantee on the majority of makes of tires, and the action taken was simply for the purpose of disabusing the minds of car owners of the misunderstanding existing on their part.

Yours very truly,

UNITED STATES TIRE COMPANY.

By J. D. ANDERSON, General Sales Manager.

New York City, Feb. 10.

We believe removing the mileage guarantee from pneumatic tires will be a good step in the right direction, as it will protect the manufacturer against misrepresentations which often occur. We believe it would help the user and operator of his car, and eventually mean that the manufacturer would produce a better tire.

Under present conditions it seems to be the aim of the manufacturer to produce a tire that will give a certain amount of mileage at a given value, where on the other hand a tire would have to be made that would stand on its merit alone.

Yours very truly,

FALLS RUBBER COMPANY,

By F. NOLTE, Secretary.

We have for the past eight years given a written guarantee for 5000 miles on Ajax tires and we shall continue to do so.

There is no denying that some of our users have taken advantage of us in making false claims of mileage obtained and thus securing adjustments which probably they may not have been justly entitled to. Yet our experience has convinced us that making a tire of the best materials, compounded scientifically and manufactured with the greatest of care, has justified the liberal guarantee that we have always offered.

Our determination to offer the highest quality tire manufactured, carries with it the further determination on our part to continue our written guarantee of 5000 miles, which accompanies every Ajax tire we sell.

Our claim for existence is quality and our proof of it is our guarantee.

Yours very truly,

AJAX-GRIEB RUBBER COMPANY,

By J. C. MATLACK, Secretary,

New York City, Feb. 17.

As we understand the guarantee adopted by the Motor & Accessory Manufacturers, each company is left free to make adjustments on such basis as it sees fit. The guarantee adopted is merely an ordinary commercial one. Any reputable manufacturer in any line usually stands ready to make good his product which is actually defective in material or workmanship. The trouble has been that the mileage guarantee on automobile tires has been abused by consumer and dealer alike. The experience of the larger tire companies in this connection has been somewhat expensive, so that it is not surprising that they should attempt to protect themselves against further loss.

Yours very truly,

MARATHON TIRE & RUBBER COMPANY.

By F. KESSER, Sales Manager.

Cuyahoga Falls, O., Feb. 13.

Death of President Cowham—Announcement is made by the Cutting Motor Car Company, Jackson, Mich., of the death in that city, Jan. 13, of William F. Cowham, president of the company. Mr. Cowham had been for a number of years a prominent figure in the automobile industry, and the loss to the Cutting company is one which will be felt personally by a large number of friends and acquaintances in all sections of the country.

MANY SALES ON LOCAL SHOW CIRCUIT.

Larger Attendance Than Ever Before Indicates Continued Interest in Automobile Industry---Splendid Success Follows New Plan at Hartford, Conn.

WHAT is claimed by the show committee to have been the only successful 50-cent local show in the country came to a close in the state armory at Hartford, Conn., Feb. 15. The management goes on to explain that the price of admission always had been 25 cents in the past and the advance was made this year in an effort to make an appeal only to those who would be interested in the cars and accessories on display. The result was far beyond the most hopeful expectation, the attendance for the week totalling more than 45,000. The first two days of the show there was some dissatisfaction among the dealers, but before the week was out most, if not all, of the exhibitors were convinced that the committee's judgment was correct.

An accompanying illustration gives a very faint conception of the beauty of the interior of the building. The setting was typical of famous East Indian scenes with the celebrated Taj-Mahal as the central figure. This is shown at the rear of the picture, and the canvass contained no less than 14,499 square feet. The weight was 4000 pounds, and it is said to be the largest drop curtain ever produced. In addition, 5000 incandescent lamps of four candlepower and 40 200 candlepower tungsten lamps were utilized in the decorations. Following the practise adopted two years ago, the official programme was in cut-out form, this time presenting the head of an Indian potentate.

Interior of the State Armory, Hartford, Conn., During Recent Display in That City, Showing the East Indian Setting Employed.

The show was under the joint management of the Hartford Automobile Dealers' Association and the First Infantry, C. N. G. The former was represented by F. W. Dart, William L. Ledger and E. C. Biddle, who have acted as show committee for this organization for some few years. The militia committee was composed of Col. John J. Hickey, Lieut.-Col. R. J. Goodwin and Capt. Earl D. Church. The list of exhibitors follows:

Pleasure Cars—Capitol City Auto Company, Mitchell; H. D. Graves, Lozier; Electric Auto Station, Baker electric; Fred T. Reid, National; Palace Auto Service Station, Hudson, Studebaker, Waverley electric; Charles Yetter, Stutz; Stevens-Duryea Company, Stevens-Duryea; L. H. Elmer, Ford; J. I. Case Manufacturing Company, Case; E. H. Harris, Overland; Miner Garage Company, Pierce-Arrow; Columbia Motor Car Company, Columbia; Philip Corbin, Fiat; New England Garage Company, Cutting; Skinner Bros., Stearns-Knight, Woods electric, Chalmers; Brown, Thomson & Co., Cadillac, Rauch & Lang electric; S. A. Foster, Rambler, Regal; Buick Garage Company, Buick, Locomobile, Alco, Little, Chevrolet; Packard Motor Car Company, Packard; Russell P. Taber, Reo; Edward Clark, Paige; R. M. Spencer, KisselKar; R. B. & C. O. Britton Company, Maxwell, Flanders electric; Magna Automobile Company, Detroit electric; Pope Manufacturing Company, Pope-Hartford; George D. Knox, Peerless; Winton Motor Car Company, Winton; Hartford Electric Light Company, Standard electric.

Commercial Vehicles—S. A. Foster, White; Brown, Thomson & Co., Lippard-Stewart; Buick Garage Company, Alco; S. A. Miner, Pierce-Arrow; Packard Motor Car Company, Packard; Russel P. Taber, Reo; Edward Clark, Paige; Pope Manufacturing Company, Pope-Hartford; George D. Knox, Peerless; R. M. Spencer, Kissel-Kar; Hartford Electric Light Company, G. V. electric; R. D. & C. O. Britton Company, Federal; Magna Automobile Company, Adams.

Miscellaneous—Indian Refining Company, H. W. Yeager, Philadelphia Grease Manufacturing Company, Finch & Hayes, Post & Lester, Perry Motor Supply

MANY SALES AT NEWARK.

Jersey People Had Considered New York Display and Were Ready to Buy.

More than 300 pleasure cars and business wagons, representing 70 different makes were in place in the First Regiment armory, Newark, N. J., when Augustus V. Hamburg, president of the Newark Board of Trade, opened the sixth annual show of the Newark dealers, Feb. 15, for one week. The event was under the direct management of Horace A. Bonnell, assisted by Claude E. Holgate and a number of men representing the local agencies.

It transpired that although many Jersey people attended the national show in New York City in January, this was largely for the purpose of making a cursory examination of the machines and to secure catalogues of the various products, which were considered in private. With the opening of the Newark show there was every disposition to make purchases, and the business transacted throughout the week was highly gratifying to the exhibitors. In attendance it is claimed by the committee that the Newark show will rank fourth in the entire country, precedence being given only to Boston, Chicago and New York.

The decorative scheme was "Jersey-American," which is a coined term originated by Manager Bonnell. The main floor presented a country estate, the pergolas being reproduced from George Gould's famous Lakewood estate, Georgian Court. Vines of smilax and flowers served to carry out the rustic setting, and a huge flower mound in the centre added a decidedly pleasing effect.

The two classes of machines, pleasure and commercial, were so arranged under one roof that ample opportunity was afforded for those who were interested in either type to make the best possible study and comparison. The list of exhibitors follows:

Pleasure Cars—J. W. Mason, Velie, Maxwell; H. J. Koehler S. G. Company, Hupmobile; R. M. Owen & Co., Reo, Premier; E. D. Carlough, Franklin, Marion; J. J. Meyer, Auburn; Lozier-Stutz Sales Company, Lozier, Stutz; Ellis Motor Car Company, Pierce-Arrow; Greene Motor Car Company, Locomobile; J. M. Quinby & Co., Simplex, S. G. V.; Wilson Motor Car Company, Moline; Edwards Motor Car Company, Pathfinder; Packard Motor Car Company of New York, Packard; Detroit-Cadillac Motor Car Company, Cadillac; Paddock Zust Motor Car Company, Chalmers; Van Deman & Wainwright, Pullman; A. Elliott Ranney Company, Hudson; A. G. Spaulding & Bros., Stevens-Duryea; Oldsmobile Company of New York, Oldsmobile; Newton-Humphreville Company, Studebaker; Service Motor Car Company, Henderson, American, Abbott-Detroit; Buick Motor Company, Buick; Central Motor Car Company, Regal; Peerless Motor Car Company of New York, Peerless; W. C. D. Motor Car Company, Flanders; Michigan Motor Sales Company, Michigan; Wallace Motor Car Company, Cole; Haynes Automobile Company, Haynes; J. W. Ward, Little, Chevrolet; Oakland Motor Sales Company, Oakland; Alexander Brunner, Kline-Kar; W. H. Linkroum, Winton; North Jersey Motor Vehicle Company, National; Rickey Machine Company, Marmon; Nyberg Auto Company of New Jersey, Nyberg; Aymar & Bradley Company, Stearns-Knight; Fairchild Electric Vehicle Company, Standard electric; R. & L. Company; Garford; Norwalk Motor Car Company, Norwalk.

Commercial Vehicles—J. W. Mason, Velie; Edward McK. Hunt, Stewart; Abendroth & Root Manufacturing Company, A. & R.; Peerless Motor Car Company of New York, Peerless; Buick Motor Company, Buick; Lansden Company, Lansden electric; Hoagland-Thayer, Inc., Adams; Greene Motor Car Company, Locomobile; Ellis Motor Car Company, Pierce-Arrow; Packard Motor Car Company of New York, Packard; International Motor Company, Mack, Saurer, Hewitt; Nonpareil Motor Truck Company, Nonpareil; Universal Motor Truck Company, Universal; A. G. Spaulding & Bros., Chase; Charles R. Zacharias, Croce; H. J. Koehler S. G. Company, Koehler; Nyberg Auto Company of New Jersey, Nyberg; J. B. Furber, International.

Accessories—Newark Rubber Tire Company, Hardman tires; Chas. E. Ball, Inc., supplies; Norben Oil & Supply Company, oils and greases; Frank E. Delano, tire filler; Van Deman & Wainwright, tires; Economy Auto Supply Company, supplies; W. S. Sheppard, oils and greases; E. W. Hirsch, fire extinguishers; Overman Tire Company, cushion tires; National Oil & Supply Company, oils and greases; Essex Storage Battery & Supply Company, supplies; Y. M. C. A. Auto School; Standard Oil Company of New Jersey, oils and greases; Joseph B. Ballantine, tops; D. B. Dunham & Son, bodies; Maxi Company, carburetors; Tire Trading Company, tires and pumps; Chas. E. Miller, full line; S. B. R. Specialty Company, supplies; Millar Supply Company, tire filler; Coffin Rubber Company; Auto Safety Signal Lamp Company; Robinson-Lewis Company; Electric Repair & Motor Company; Commercial Casualty Company, insurance; A. H. Van Deman, tire treads.

FOREST SETTING FOR CARS.

Minneapolis Dealers Make Sixth Annual Display Among Natural Tree Trunks.

The national circuit show in Minneapolis, Minn., which was the sixth annual event for the dealers of that city, was held Feb. 10-15. The interior of the state armory was transformed into a forest, the cars being displayed among natural tree trunks, and an immense painting of Minnehaha falls at the end of the main hall carrying out the effect in a pleasing manner.

The show was held under the management of Walter L. Wilmot and special trains brought large delegations from all sections of the state. As a result there can be little doubt as to the effect of the display in a business way. The list of cars shown is given below:

American, Stutz, Premier, Paterson, R-C-H, Hudson, Speedwell, Cutting, Jackson, Stanley steam, Packard.

Digitized by Google

BINGHAMTON ADOPTS INNOVATION.

Visitors Encouraged to Inspect Accessory Display Before Car Exhibit Is Opened.

The Binghamton Automobile Dealers' Association, Binghamton, N. Y., has attempted to inaugurate some interesting innovations at each of its annual exhibitions, of which that which opened in the state armory Feb. 11 was the fourth. This time there was effort to secure added interest in the accessory division by opening the doors to the balconies, etc., in advance of those leading to the main floor. Mayor John J. Irving presided at the formal exercises, after which the visitors were free to inspect the cars as well.

Binghamton has an enviable reputation in southern New York State for its interest in motor cars and motoring. The Binghamton Automobile Club has aided the local dealers materially in fostering annual touring events, etc. It is not surprising, therefore, to note that the attendance at this year's show, which closed Feb. 15, was much larger than heretofore, and that the business transacted was of satisfactory proportions.

The decorative scheme was simple yet effective. Electric lights played an important part, these hanging in festoons from the balcony front to the chandeliers and girders and outlining the anchor, crescent and star on the side walls. The complete list of exhibitors follows:

Pleasure Cars—Binghamton Motor Car Company, Buick, Pope-Hartford, Lozier, Oakland, Stevens-Duryea; June Automobile Company, Mitchell, Chalmers, Regal; New York Sales Company, Hudson, Cole, Paige, Little; Binghamton Cadillac Company, Cadillac; R. H. Martindale, Michigan; Knickerbocker Motor Car Company, Henderson; Binghamton Ford Sales Company, Ford; H. H. Young Automobile Company, Imperial, Empire; Lowell & Hammond, Stutz, Marmon, Overland; J. M. Davidge, Pierce-Arrow; S. H. Lewis Company, Franklin, Abbott-Detroit, Maxwell; Palmer-Singer Distributing Company, Palmer-Singer; Lewis & Noblette, K-R-I-T, Marion; C. H. Worden, Studebaker; R. W. Whipple, Packard; W. A. Crandall, White, Detroit electric; Prentice & Hoadley, Hupmobile, Metz.

Commercial Vehicles—S. H. Lewis, Chase; L. W. Gillespie, Brockway; Tiona Oil Company, Atterbury; George S. Storrs, International; R. W. Whipple, Packard; Binghamton Motor Car Company, Buick, Detroit electric, Federal.

Motorcycles—George S. Carver, Dayton; H. Hutchins, Monarch; Frank S. Bump Company, Merkel, Indian; B. E. Jewell, Excelsior; W. J. Lyon, Henderson, Yale; Turner's Bicycle Store, Harley-Davidson.

Accessories—N. H. Snow, tops and fittings; E. Q. Williams, spark plugs; R. W. Whipple, supplies; Fred P. Carter, clocks; Myers Bros., novelties; Tuec Company of Binghamton, vacuum cleaners; O. K. Vulcanizing Company, tires and repairs; Whipple-Davis Agency, insurance.

Attractive Decorative Scheme Utilized by Rochester Automobile Dealers for the Accessory Division of Recent Show.

RICHMOND'S SECOND EXHIBITION.

Old Horse Show Building Selected for Display in the Historic Virginia City.

Perhaps no more appropriate location could have been selected for the second annual exhibition of the dealers in Richmond, Va., Feb. 17-22, than the old Horse Show building, where in former days the members of the first Virginia families assembled to inspect the best horses of the country. The show was one calculated to impress the visitor with the fact that the driving

Digitized by Google

horse of the past has been superseded in every way by the automobile of the present.

The event was under the management of Thomas R. Hutcheson, who was ably supported by the members of the local association. The interior of the building was transformed into a garden, beautifully illuminated by thousands of electric lights. The attendance was even larger than last year, and the dealers are confident that the business transacted and in prospect more than repays them for their efforts. Among those who made display were:

Ford Auto Company, W. C. Smith & Co., Overland Sales Company, Jones Motor Company, Foster Motor Company, Lloyd Motor Company, D. A. Pretiss & Co., Kaufman & Co., B. A. Blenner, Haviland Oil Company, International Harvester Company, Alsop Motor Company, Broad Rock Lithia Water Company, Eastern Motor Sales Company, Gordon Motor Company, Coleman Cuthins, Shafer Manufacturing Company, Shenandoah Motor Company, Worth Electric Company, Chicago Pneumatic Tool Company, Baker & Hatke.

MANY EXHIBIT AT BALTIMORE.

Good Business Results Despite Big Shows Previously Held in Nearby Cities.

Under the able management of H. M. Luzius the Baltimore Automobile Dealers' Association held its annual show under the joint auspices of the Automobile Club of Baltimore in the Fifth Regiment armory, Feb. 18-22. Despite the fact that a number of shows have been held within easy access of Baltimore within the past two months, the attendance was so large as to give indication that the people of that city and vicinity had been awaiting the annual local exhibition before making up their minds with reference to the season's models.

The decorations were quite in keeping with the previous shows held under the same management. The business transacted was such as to indicate to the local dealers that it is wise to continue the local show, insofar as that city is concerned at least. The list of car and accessory exhibitors is given below:

Pleasure Cars—Auto Outing Company, Buick; Beehler & Ogden, K-R-I-T; Carter Auto Company, Havers; Chesapeake Garage, Rambler; Chesapeake Motor Car Company, Hupmobile; Colonial Motor Company, Studebaker; J. S. Ditch & Co., Detroit electric; Ford Auto Company; Ford; Foss-Hughes Company, Pierce-Arrow; Franklin Motor Car Company, Franklin; Lambert Automobile Company, Hudson, Church-Field electric; Locomobile Company of America, Locomobile; Mar-Del Mobile Company, Packard; Michigan Garage Company, Michigan; Model Automobile Company, Apperson; Motor Car Company, Stevens-Duryea, Overland; Mt. Vernon Motor Car Company, KisselKar; Neely & Ensor, Alco, Kline-Kar; Norwalk Motor Sales Company, Norwalk; Oakland Motor Company, Oakland; Pullman Motor Car Company, Pullman; Rice Bros. Company, S. G. V.; Rittenhouse-Winterson Auto Company, Cartercar; F. W. Sandruck, American; Schacht Motor Company, Schacht; Schall & Crouch Auto Company, Lozier, Paige; Stoddard-Dayton Auto Company, Stoddard-Dayton; Walter Scott, Marmon, Premier; Carl Spoerer's Sons Company, Spoerer; Square Deal Auto Company, Empire, Maxwell; Standard Motor Company, Cadillac; L. M. Vordemberge Motor Company, Pathfinder; D. C. Walker Auto Company, Stearns-Knight, Mitchell; White Motor Company, White; Winton Motor Car Company, Winton; Zell Motor Car Company, Peerless, Chalmers, Rauch & Lang electric.

Commercial Vehicles—C. B. B. Motor Company, Kelly-Springfield, Modern; Chase Motor Truck Company, Chase; Colonial Motor Company, Universal; Consolidated Gas Electric Light & Power Company, G. V. electric; Foss-Hughes Company, Pierce-Arrow; International Harvester Company, International; International Motor Company, Mack, Saurer; Locomobile Company of America, Locomobile; Lord Baltimore Motor Car Company, Lord Baltimore; Mar-Del Mobile Company, Packard; Neely & Ensor, Alco, Lippard-Stewart; Oakland Motor Company, Federal; Rittenhouse-Winterson Auto Company, Seitz, Commerce, Baker electric; Schacht Motor Company, Schacht; White Motor Company, White; Zell Motor Car Company, Peerless, Chalmers.

Accessories—Auto Air Appliance Company, Auto Supply Company, Autogenous Welding & Equipment Company, Baltimore Buggy Top Company, J. M. Brian, 3rd., Brooks-Ward Supply Company, George R. Curtis, Dahl Punctureless Tire Filler Company, Elastic Wheel Company, Essenkay Sales Company of Maryland, Howard A. French & Co., French-Schutz Company, Gauer-Blaylock & Co., T. J. Gallagher, August Gross' Sons, Heinz Motor Company, Holofcener Gas & Electric Fixture Company, Indian Refining Company, International Manufacturing Company, Keystone Lubricating Company, Little Joe Weisenfeld Company, Maryland Auto Supply Company, Maryland Electric Supply Company, Maryland Motor Car Insurance Company, Merryman & Robinson, R. W. Sandruck, R. M. Stein Company, W. T. Shackelford & Co., Carl Spoerer's Sons Company, Standard Oil Company, R. W. Thompson.

ALBANY'S FOURTH DISPLAY.

More Than 22,000 People View the Exhibition of Pleasure Cars and Trucks.

The fourth annual show of the Albany Automobile Dealers' Association was held in the state armory, Albany, N. Y., Feb. 15-22, under the management of C. A. Simmons. The attendance for the week was over 22,000, the largest number that has ever been present at a motor car show in Albany. Practically every dealer reported more sales than at previous displays.

It was the largest Albany show in every way. A third more exhibition space was provided by a rearrangement of the aisles, and the list of machines was complete in all respects. Pleasure cars were disposed about the main drill hall, while the commercial vehicles were seen in the basement. The increasing interest in the mechanical transport was reflected by the fact that it was customary to find large crowds in that section throughout the entire week.

Manager Simmons was assisted by the following committee of the dealers' association: Chairman, C. D. Hakes; treasurer and secretary,

J. B. Wood; E. V. Stratton, C. F. Weeber, W. J. Sutherland, J. S. Kingsbury, W. B. Mason.

PRESIDENT TAFT OFFICIATES.

Presses Button Which Formally Opens Dealer's Show in Washington, D. C.

The annual show of the Washington Automobile Dealers' Association, which came to an end in Convention hall, Washington, D. C., Feb. 8, was marked by the fact that for the first time in the history of the industry an exhibition of this character was formally opened by the President of the United States. In his office at the White House, President Taft pushed a button which turned on the 15,000 electric lights and unfurled a large American flag in the centre of the exposition building. The display included a wide representation of the pleasure cars, commercial vehicles and accessories carried by dealers and agents in that city.

The event was in charge of a show committee, of which President T. O. Probey was chairman and general manager. The other members were: J. H. Miller, F. W. Robartes, Arthur Foraker, W. Bruce Emerson, Charles W. Semmes, E. A. Garlock, I. J. Henderson, F. C. Sibbaid, J. H. Duryea, J. Edward Chapman and A. D. Loeffler. To these men belongs a large share of the credit for the successful outcome of the venture. The attendance throughout the week was particularly pleasing and the amount of business transacted was thoroughly in keeping with the importance of the event. The list of exhibitors follows:

Pleasure Cars—Berryman & Williams, Pathfinder; A. D. V. Burr, Winton; G. H. Cowle Company, Cole; J. H. Earle Company, Oakland; Emerson & Orme, Detroit electric, Apperson; Henderson-Rowe Company, Chevrolet, Little, Pullman; T. Lamar Jackson, Stevens-Duryea; Locomobile Company of America, Locomobile; A. Loeffler Company, Speedwell, Regal; Matheson Motor Company, Premier, Henderson, Michigan; Miller Company, Stutz; Norwalk Motor Company, Norwalk; Washington Auto Service Company, Hupmobile; White Automobile Company, White.

Commercial Vehicles—Congressional Garage, Wilcox; Henderson-Rowe Company, Pullman; International Harvester Company, International; Knox Truck Company, Knox Martin tractor; Locomobile Company of America, Locomobile; A. Loeffler Company, Speedwell, Commerce, Lippard-Stewart; White Automobile Company, White.

Motorcycles—Berryman & Williams, Harley-Davidson; Haverford Cycle Company, Haverford; Osborne & Leishear, Excelsior, Henderson, Baxter sidecar.

Miscellaneous—Barber & Ross, accessories; Irvin T. Donohoe, accessories; Metal Shelter Company, garages; Edwards Manufacturing Company, garages; Keystone Lubricating Company, oils and greases; Meyer Bros., ivory novelties; Leroy Mark, insurance; Sin-Ti Rubber Company, tire preserver; Vacuum Sales Company, vacuum cleaners.

ONE SHOW FOR PITTSBURG.

All Danger of Competition with Exposition Display Seems to Have Disappeared.

While for some time there has been a movement on foot in Pittsburg, Penn., to hold a rival exhibition of motor cars during the week of March 1-8, when the display in the Exposition building under the management of Thomas I. Cochran will be held, at present there does not appear to be any danger of such competition. Announcement is made that the second show has been postponed until a later date.

The display space at the Exposition building measures 350 by 165 feet, and this is maintained to be larger than that afforded in Madison Square Garden in New York City. The 1913 show will be the third under the auspices of the Pittsburg Auto Show Association, and the experience of Manager Cochran has been such as to warrant the advance assumption that it will be larger and better than before. Every step has been taken to make it one of the motoring classics of the year. Pleasure vehicles and commercial cars will be shown and a line of accessories and supplies.

Poster Utilized to Announce Forthcoming Pittsburg Show.

DEALERS HOLD OWN SHOW.

This Year's Event in Portland, Me., Differs from Those Held in the Past.

Although the dealers in Portland, Me., have held a number of shows, these have been managed heretofore by outside parties. This year the Portland Automobile Dealers' Association decided to hold its own display, which was conducted by W. B. Thombs and an able committee in the new City Hall auditorium, Feb. 10-12. It afforded an excellent opportunity for the people of Maine to inspect the new models, many of

Digitized by Google

which were exhibited in that state for the first time.

The attendance was decidedly satisfactory, and from a business standpoint there was a large number of closed sales and an unusually long list of prospects. The decorations were simple, but effective. There is little doubt that the plan adopted this year will be continued in other years. The list of exhibitors was as follows:

Automobiles—W. B. Thombs, Buick, Chevrolet, Little; Spear Auto Company, Ford, Detroiter, Flanders; A. F. Talbot, American; E. E. Wentworth, Marion; Stoughton-Folkins Company, Oakland; Portland Company, Knox, Cole; Morrill & Higgins, G. M. C. truck; F. A. Nickerson, Pierce-Arrow, National; Maine Motor Car Company, Chalmers, Peerless, Pope-Hartford, Paige, Stevens-Duryea; T. B. Jefferies, Rambler; R. D. Milliken, Imperial; Miles B. Mank Motor Company, Cadillac; W. E. Hackett, Stearns-Knight; Harmon Auto Company, Hudson; W. M. Chellis, Franklin; L. C. Gilson Company, Mitchell, K-R-I-T; Darling Auto Company, Reo.

Accessories—Portland Garage Company, York & Boothby, Kendall & Whitney, Wayne Oil Tank & Pump Company, Darling Auto Company, Cressey & Allen, Talbot, Brooks & Ayer, Little-Coffin Company, Gulf Refining Company, Standard Oil Company, Maine Motor Car Company, L. W. Cleveland Company, James Bailey Company.

BROOKLYN'S BIG DISPLAY.

Splendid Line of Cars and Satisfactory Business Follows Opening of Third Exhibit.

The attendance on the opening night and the experience of previous displays was such as to indicate to the members of the Brooklyn Motor Vehicle Dealers' Association that the third annual display in the Twenty-third Regiment armory, Brooklyn, N. Y., Feb. 22-March 1, would prove by far the most successful yet held. The proximity of this section to the national exhibition in New York City is held to be a help rather than a deterrent to satisfactory sales. The people of Brooklyn and Long Island apparently attend the larger show, and after making decision in their own homes come to the Brooklyn display prepared to make purchases.

The armory was transformed into a garden setting. From the high roof a large silk canopy hung in long wavy folds. Natural flowers and growing plants helped to make the scene one long to be remembered. The electric lighting effect was particularly pleasing, and the cars and accessories were so disposed as to take utmost advantage of the illumination provided.

The management of the event was in the hands of Harry A. Cochrane, who has had ample experience in the matter of staging shows of this character. His plan of providing room for all makes of pleasure and commercial vehicles, as well as accessories and supplies, in one building, proved of decided value with those who were anxious to learn of the merits of the respective productions. The list of exhibitors is presented below:

Pleasure Cars—Joseph D. Rourke, Haynes; Central Motor Car Company, R-C-H, Henderson; Central Garage, Jackson; Detroit Cadillac Company, Cadillac; A. Elliott Ranney Company, Hudson; Fairchild Electric Vehicle Company, Baker and Standard electrics; Gotham Motor Car Company, S. G. V.; Harrolds Motor Car Company, Pierce-Arrow; Mitchell Motor Company, Mitchell; E. I. Montigney, Stutz; C. H. McCausland, KisselKar; R. M. Owen & Co., Reo, Premier; Packard Motor Car Company of New York, Packard; Poertner Motor Car Company, National, Herreshoff; Peerless Motor Car Company of New York, Peerless; Prospect Park South Garage, Crawford; White Company, White; I. S. Remson Manufacturing Company, Locomobile, Abbott-Detroit; Buick Motor Company, Buick; Simplex Automobile Company, Simplex; Winton Motor Car Company, Winton; M. I. Wolfe, Flanders, Oldsmobile, Knox; Bishop, McCormick & Bishop, Ford, Cole, Paige; Cumberland Garage Company, Velie; Woods Garage & Sales Company, Oakland; I. M. Allen Company, Stevens-Duryea; Parry Auto Sales Company, Hupmobile and Pathfinder; Rambler Motor Car Company, Rambler; Dunham Auto Company, Lozier, Moon; Carpenter Motor Vehicle Company, Studebaker; Montauk Motor Company, Pope-Hartford; Pastre's Garage, Inc., Columbus electric, Firestone-Columbus; Farrell Auto Company, Apperson; Charles S. Tate, Regal; Bruns Auto Company, Chalmers; Ackerman & Baird, Mercer; Stewart Auto Company, Pullman; Drouet & Paige, Inc., Palmer-Singer; I. C. Kirkham, American; Church-Field Electric Company, Church-Field electric; Benz Auto Import Company, Benz; Norwalk Motor Car Company, Norwalk.

Commercial Vehicles—White Star Motor & Engineering Company, White Star; International Motor Company, Saurer, Mack, Hewitt; R. & L. Company, Garford; Wholesale Supply Company, Lansden electric, Maccarr; Universal Motor Truck Company, Universal; Harrolds Motor Car Company, Pierce-Arrow; C. H. McCausland, KisselKar; R. M. Owen & Co., Reo; Packard Motor Car Company of New York, Packard; Peerless Motor Car Company of New York, Peerless; White Company, White; I. S. Remsen Manufacturing Company, Locomobile; Buick Motor Company, Buick; M. I. Wolfe, Knox; Bishop, McCormick & Bishop, Ford; Cumberland Garage Company, Velie; Parry Auto Sales Company, Hupmobile; Montauk Motor Company, Pope-Hartford; Farrell Auto Company, Cass; Autocar Company, Autocar.

Accessories—Chas. E. Miller, Long Island Auto Club, Powell-Elliott Auto Repair Company, Martin-Evans Company, Paul L. Marko & Co., Julius Bindrim, Ernest Flentje, Newmastic Company, Pullman Tire Company, Carron & Co., Inc., Oriental Rubber & Supply Company, Aristos Company, A. H. Kegenhard, Schaap Flame Welding System, Owen-Rollman, Metal Shelter Company.

BOSTON'S ANNUAL EXPOSITION.

Chester I. Campbell, Veteran Show Manager, Plans Bigger and Better Than Ever.

Although the task has been made somewhat more difficult by reason of the large number of shows throughout the country this year, Chester I. Campbell, the man who has managed every automobile, motor boat and aeroplane display that Boston has had, believes he has succeeded in arranging a bigger and better Boston show than ever before. As was true last year the exhibition will be conducted in two sections, that for pleasure cars and their accessories, March 8-15, and

Digitized by Google

that for commercial vehicles and their accessories, March 19-26.

Advance announcements indicate that there will be a much larger representation of both pleasure cars and trucks than at either New York or Chicago, and this despite the fact that the Boston display will be held under one roof in the Mechanics' building, instead of two or four as was true of the two national exhibitions. Boston, by the way, is on the national circuit this year, although still classed as a dealer's show, the first section being under the auspices of the Boston Automobile Dealers' Association and the second in charge of the Boston Commercial Motor Vehicle Association.

The Boston show is recognized as the leading display in the country, and this applies in every respect. Concerning the decorative treatment, while no detailed announcement has been made concerning it, it is promised that no trade exhibition in the country ever has had a more beautiful setting.

SYRACUSE PLANS COMPLETE.

More Exhibitors Than Ever Before for Fifth Annual Dealer's Show.

Everything is in readiness for the opening of the fifth annual show of the Syracuse Automobile Dealers' Association in the state armory, Syracuse, N. Y., Feb. 25, for one week. A study of the list of exhibitors indicates that there will be 92 pleasure vehicle displays, 30 of commercial cars, six of motorcycles and 30 of accessories.

The show is under the management of Henry T. Gardner, who has planned an elaborate setting representing an Italian garden, in which southern smilax and artificial blossoms will assist in carrying out the idea with 24 classic busts. Cars ranging in value from $475 to $5000 will be on display, and present indications are that the event will be by far the most successful held in that section.

HAVOLINE OIL EXHIBIT.

Special Display Arranged by Indian Refining Company for Use at Local Shows.

Being represented by a large number of distributing stations throughout the country, the Indian Refining Company, 17 Battery place, New York City, maker of Havoline oils, has taken advantage of the opportunity afforded by local shows to bring its product more directly to the attention of the motoring public. An accompanying illustration presents the exhibit prepared for this purpose, and it may be added that the large can and the name Havoline are transparent and illuminated, making a decidedly attractive display.

Havoline oils are made from the best grade of crude, which is carefully filtered by a special process to remove the free carbon and carbon producing elements. Particular care is taken in this branch of the work so that the resulting product is held to be one which will burn up cleanly and perform its function of lubricating the motor without undesirable carbon deposits.

Havoline Oil Display Utilized by Indian Refining Company at Local Shows Throughout the Country.

In addition to the Havoline oils for motor lubrication, which are produced in three densities for pleasure vehicles—heavy, medium and light—there are special oils for different motors, motorcycles, marine engines, motor trucks, gears, transmissions, etc., and Havoline greases, compounds and soaps. The same high grade materials and careful attention to the preparation are noted in all the products.

At the various displays the Indian Pathfinder, or Havoline oil book of tours, each volume covering a certain section or state, is distributed as well, or these may be secured by addressing the company, in which event the applicant should make clear the section in which he is interested.

MANAGES PREST-O-LITE BRANCH.

Well Known Boston Man Heads New England Organization in That City.

A. N. Dodge, who on Feb. 1 took charge of the Boston branch of the Prest-O-Lite Company, Indianapolis, Ind., is one of the best known men in the motor car industry in and around Boston. He first became identified with the business in March, 1907, connecting himself with Chester I. Campbell in the management of the Boston Automobile Dealers' Association shows. He continued in this position until September, 1908, when he resigned to become New England manager for the Truscott Boat Manufacturing Company.

In 1911 he resumed his work with Mr. Campbell, with whom he remained until he assumed charge of the Prest-O-Lite Company's Boston branch Feb. 1. Mr. Dodge's many friends in the industry in Boston and vicinity have given him their warmest congratulations, while hundreds of well known motorists have called at his office to wish him the best of success in his new venture. His experience has been such as to warrant the prediction that the business done by this branch will show a marked increase under his management.

Arthur N. Dodge, Manager, Prest-O-Lite Boston Branch.

MILLER ADOPTS PARCEL POST.

Pioneer Accessory Dealer First to Announce Free Delivery by This Method.

Chas. E. Miller, 97-103 Reade street, New York City, the pioneer accessory house in America, is the first to make announcement of the intention to utilize parcel post for making free delivery of the products handled anywhere in the United States. This is strictly in line with the Miller policy, and in effect places a Miller branch in every locality in the country.

In addition to the New York headquarters, which has built up a splendid business during the past 15 years, branch houses are located in New York City, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Philadelphia, Penn.; Newark, N. J.; Detroit, Mich.; Cleveland, O.; Atlanta, Ga., and New Orleans, La. The big Miller catalogue, which is free to anyone at request, places the individual motorist, no matter where located, in direct touch with any of these stores, and parcel post makes it possible to take advantage of New York prices or special quotations.

NEW MOTOR FUEL COMING.

Standard Oil Company Said to Be Prepared to Introduce Motor Spirit.

According to information from Chicago, the Standard Oil Company is prepared to market a new fuel for automobiles to be known as motor spirit. This is said to be a by-product of petroleum, with a gravity of 52-55 degrees, Baume, as compared with 58-60 for the present grades of gasoline. It is expected to sell for three cents a gallon less and to give at least 25 per cent. more mileage.

Motor spirit is said to have existed for some time, but with a color and odor which made it unsuitable for use. W. M. Burton is held to have perfected a process of refinement upon which patents only recently were granted. Experiments are said to have shown that a slight adjustment of the carburetor becomes necessary because of the need for more air.

SPLITDORF'S FOREIGN POLICY.

Will Locate Branch and Service Station in London for European Users.

Another step in the Splitdorf policy to secure absolute service for users of its ignition devices was taken when O. J. Rohde, treasurer and general manager of the Splitdorf Electrical Company, Newark, N. J., sailed for Europe on the Kaiserin Augusta Victoria, taking with him a corps of experts on magnetos, coils and ignition in general. They will be established in London to attend to the wants of users of American cars.

Mr. Rohde has systematized the New York service station of the company to such a degree of perfection that his ideas will prevail in the working out of the details for the accommodation of Europeans and visitors alike. He will establish the service stations abroad with practical men in charge and when the system is thoroughly organized he will return to New York.

DETROIT BRANCH FACTORY.

Philadelphia Body Building Concern Locates Additional Plant in the Heart of the Industry.

The Edward G. Budd Manufacturing Company, Philadelphia, Penn., maker of automobile bodies, has decided to establish a branch factory in Detroit. The advantages of being in the heart of the automobile industry became apparent when an opportunity presented itself to purchase the buildings formerly occupied by the Grabowsky Power Wagon Company, which recently went into bankruptcy, and the Budd company has taken possession of this plant.

The property consists of 8.5 acres of land with buildings and the price paid was $110,000. The appraised valuation of the property is said to be $140,000. Contained in the purchase is a modern reinforced concrete building, four stories high, with 72,000 square feet of floor area, and a modern power building. There are also several sheds which the Grabowsky company utilized for storage purposes.

The Budd plant in Philadelphia will be operated to supply the trade in the East and south of Toledo, O., while the Detroit branch will handle the Michigan business and part of the West. By next May it is anticipated the production will total 30 completed bodies a day. The Edward G. Budd company was organized in June, 1912, with capital of $500,000 all paid in, and manufactures pressed steel bodies for commercial and pleasure cars.

THE CHANDLER ORGANIZATION.

Additional Details Concerning Company Which Will Produce New Six-Cylinder Car.

Following the announcement of the Chandler six-cylinder car during the progress of the Chicago pleasure vehicle show, comes the information that the Chandler Motor Car Company is located temporarily at 982 Woodward avenue, Detroit, although it is not anticipated that the machine will be produced commercially in that city. The officials of the company are: President, F. C. Chandler; vice president and sales manager, Charles A. Emise; treasurer, Samuel Regar; secretary, M. S. Mead; designer, J. V. Whitbeck; superintendent, J. R. Hall.

It is learned that in August of last year Mr. Chandler resigned as general manager and Mr. Regar as treasurer of the Lozier Motor Company, Detroit. They employed Mr. Whitbeck, who severed his connection with the Lozier engineering department at the same time, to design the new car. The other officials of the Chandler concern tendered their resignation with the Lozier company about the same time, but continued in their connections until released. In the meantime work has been underway on the new model in a temporary shop and it was given its first road trials several weeks ago.

JOINS LOZIER COMPANY.

Paul H. Smith Will Head Sales Department in Charge of Dealers and Agents.

President Harry M. Jewett of the Lozier Motor Company, Detroit, maker of Lozier cars, who has been building up his organization since he assumed the presidency of the company four months ago, has completed what he believes to be one of the most efficient executive forces in the industry. The latest addition to the Lozier staff is Paul Smith, who becomes sales manager with full charge of all branches, dealers and agents.

The association of Mr. Smith with the Lozier company will no doubt largely increase the distribution of Lozier cars. Four years ago he became assistant sales manager and for the past three years has headed the sales force of a company where he made an exceedingly strong reputation for doing business in a large way. During this time the production of this concern increased from 12,000 cars a year to 50,000. Mr. Smith has been identified with both high and medium priced machines and his knowledge of and personal acquaintance with over 4000 dealers will be of decided value to the Lozier company.

NEW STEEL CONCERN.

Pittsburg Men to Locate Plant to Produce Automobile Material in Canal Dover, O.

A new concern, capitalized at $1,200,000, to be known as the Dover Superior Steel Company, has closed negotiations to locate its plant at Canal Dover, O., and will employ 600 men. The promoters of the company are all well known and practical steel men of Pittsburg, Penn., including W. M. Parkin, H. T. Myer, Archie Smith and M. S. Young.

The firm is to manufacture steel bar for automobile chassis and steel furniture. The metal will be received at its plant direct from the Canal Dover furnace and in its molten state. Thirty-

Digitized by Google

five acres of ground adjoining the furnaces have been secured for the erection of the plant.

INCREASES CAPITAL STOCK.

Maker of Midland Cars Prepares for Enlarged Production Facilities in Present Quarters.

The capital stock of the Midland Motor Company, Moline, Ill., maker of Midland cars, has been increased from $100,000 to $300,000. Decision to vote the increase was reached at a special meeting of the stockholders and the entire additional issue of stock has been subscribed.

The purpose of the increase is to enlarge the output of the plant. No additional buildings will be erected at present, the size of the plant being such that it can accommodate a comfortable growth in the Midland production. It was made known at the stockholders' meeting that during the present year 1000 cars will be built and placed on the market.

UNDERWRITERS' ORGANIZATION.

Western Insurance Men Meet at Chicago, Formulate Plans and Elect Officers.

The Western Automobile Underwriters' Association was organized at a meeting of companies writing that class of insurance, held at Chicago recently. P. D. McGregor of the Queen Company presided and F. J. Sauter of the A. D. Baker Agency, was elected secretary. William S. Warren, who has been active in the organization work, reported on the previous meetings and the negotiations which have been carried on with the eastern interests, together with the plan for co-operation between the New York and Chicago conferences, providing for an interlocking board of directors.

The constitution, bylaws and rules of practise were submitted and adopted. The following officers were elected: President, P. D. McGregor, Queen; vice president, Thomas E. Gallagher, Aetna; secretary and treasurer, F. J. Sauter, A. D. Baker General Agency; executive committee, T. E. Gallagher, William S. Warren, Liverpool & London & Globe; H. C. Eddy, Commercial Union; C. E. Dox, London & Lancashire & Orient; A. D. Baker, Michigan Commercial & Old Colony; F. H. Osborn, Federal Union; F. R. Bigelow, St. Paul F. & M.; Marshall & McElhone, Fireman's Fund, and S. K. Crawford, American Automobile Company.

TO DOUBLE ITS CAPACITY.

Universal Motor Truck Company Secures Additional Capital and Will Increase Plant.

Fred K. Parke, secretary, treasurer and general manager of the Universal Motor Truck Company, Detroit, maker of Universal trucks, has announced that the company has been incorporated under the laws of Delaware, the capital stock being $1,200,000, of which $500,000 is preferred stock and $700,000 is common. All stock has been sold and work will be begun at once on the erection of a factory quite as large as the present plant.

The new building will adjoin the old one, the company having owned the entire square block of property since its organization. It will cost $250,000 without the machinery. According to Mr. Parke the Universal company will soon be one of the largest concerns in the world producing commercial vehicles and as the business increases other additions will be made.

FORM CREDIT ASSOCIATION.

Omaha Jobbers and Dealers Organize to Further Their Mutual Interests.

A meeting of the jobbers of automobile supplies and the local representatives of tire factories was held in Omaha, Neb., during the recent show to perfect arrangements for forming a credit association and a constitution and bylaws were adopted. The name of the new organization will be the Automobile Supply Jobbers' Credit Association of Omaha.

This association was formed for the protection of its members in matters of credit and for the betterment of trade conditions in its territory. The following officers were elected: President, C. G. Powell; vice president, Arthur Storz; secretary and treasurer, L. C. Cohen. These three officers, together with T. V. Graves of the Goodyear Tire & Rubber Company, and F. H. Waldman of the Omaha Rubber Company, will conduct the affairs of the organization.

Robert Burman, the racing driver, has signed a contract to drive a Keeton car, made by the Keeton Motor Company, Detroit, in the 500-mile race at Indianapolis, Ind., May 30. Burman will superintend the construction of the car himself at the factory of the company.

NEW TRUCK MODELS AT CHICAGO.

Twenty-Four Makes Not Seen at New York Display Are Represented at Show in Western Metropolis--Some of the Construction Features Revealed.

TWENTY-FOUR makes of commercial motor vehicles which were not seen at New York City were shown by the manufacturers exhibiting during the second week of the Chicago show in the Coliseum, Annex, First Regiment armory and Wilson building, Feb. 8-15. Eight of these were produced in Chicago and practically all of the others in the Middle West. It must not be understood that all of the 24 were entirely new, although it is true that some of them had never before been exhibited at a national show, either in New York or Chicago.

General View of the Coliseum Main Floor During the Progress of the Commercial Vehicle Display in Chicago.

The business done at Chicago was quite in keeping with that which had been anticipated. This was in a measure due to the plan adopted by the management under Samuel A. Miles, two years ago, of sending personal invitations to business men, municipal authorities and others at all likely to be interested in the display. The setting was the same as that which attracted the attention of the visitors during the first, or pleasure vehicle section.

The 24 makes shown for the first time this year were: Adams, Avery, Buffalo electric, Clark, Commerce, Diamond T, Four Wheel Drive, Harder, Harvey, Hercules, Ideal, Jeffery, Litttle Giant, Menominee, Mercury, Mogul, Moon, Moore, Natco, Old Reliable, Sampson, Urban electric, United States and Walker electric. While each was of special interest, it follows that not all were of equal importance from the standpoint of those who were searching for features that could be regarded strictly in the light of radical departures from standard construction.

For instance, there is little doubt that the product of the Four Wheel Drive Auto Company, Clintonville, Wis., which made its initial appearance at any national show, attracted unusual attention. As its name implies it is driven by all four wheels, both axles being operated by shaft and bevel gears. The motor drives in the usual way to a gearset in which the gears always are in mesh, the different speeds being engaged by individual friction clutches.

Back of the change gear casing is a sub-transmission in a separate compartment, which con-

Digitized by Google

sists of differential and gears in the 1.5-ton truck and differential, silent chain and gears in the three-ton model. This sub-transmission transfers the power from the centre line to the left side of the truck. Inside the driven gear in the sub-transmission is placed a differential from which extend the drive shafts to the axles. This is held to keep the power and strain equally divided between the front and rear axles, also to permit turning of corners without stresses upon any of the shafts, axles, tires or other parts of the truck.

Both axles are of the full floating type. Close to the wheel hubs on the forward member are placed the patented ball and socket steering joints, which enclose special universal joints, permitting the axle to drive either in a straight line or at an angle. The braking system comprises one set of external band members secured to the universal joints on the drive shafts leading to both front and rear axles, and another acting on drums on the rear wheels.

One Corner of the Chicago Truck Show with the Adams Line in the Foreground.

Another distinctive design is that of the Diamond T, made by the Diamond T Motor Car Company, Chicago, which is worm driven. That is, there are three models produced, two of which are worm driven, these being rated at 1.5 and three tons. A five-ton model has final drive by double side chains. It may be well to add that the three-ton model was not shown. The smaller chassis is fitted with a block motor employing fixed ignition and enclosed valves. In this the gearset case is a unit with the motor. In the five-ton chassis the motor and transmission are separate.

The Ideal, made by the Ideal Automobile Company, Fort Wayne, Ind., differs from conventional practise in the use of the Wayne gearless differential in the rear axle. In the casing usually occupied by the gears is a pair of friction clutches actuated by cams. The application of the driving power throws the cams slightly and expands and engages the clutches. When one wheel moves faster than the other as on a curve, the clutch of that wheel shaft becomes disengaged, leaving the wheel to run free, while the other takes the drive. So long as both are moving together the driving power is held to be equally distributed. The car is made in two models of one and two tons capacity.

Another new form of transmission is found in the Menominee, made by the D. F. Poyer Company, Menominee, Mich. The motor and transmission are a unit, and instead of driving direct from the mainshaft to the propeller shaft, there is a pinion on the mainshaft which drives a gear located directly beneath it. The shaft that carries this gear drives the propeller shaft, and as a result the latter starts from a position several inches lower than would be possible with the motor unit located as it is to insure the maximum of accessibility.

The Commerce, produced by the Commerce Motor Car Company, Detroit, is the only one of the new models to use the friction drive. Practically the only difference in the line is the addition of a 1250-pound delivery wagon which has slightly heavier construction and an engine of more power than the 1000-pound wagon.

The Harvey, produced by the Harvey Motor Truck Works, Harvey, Ill., is a new model. It is made in but one capacity, being rated at one

Digitized by Google

ton. Standard construction is utilized in the main, although a departure is to be noted in the use of cast steel wheels. If memory serves correctly, this is the first vehicle of light capacity to be equipped in this manner, although several makers of heavy duty machines are utilizing them. The motor is of the L head type and has four cylinders. The transmission is selective and affords three speeds forward and reverse. Final drive is by side chains.

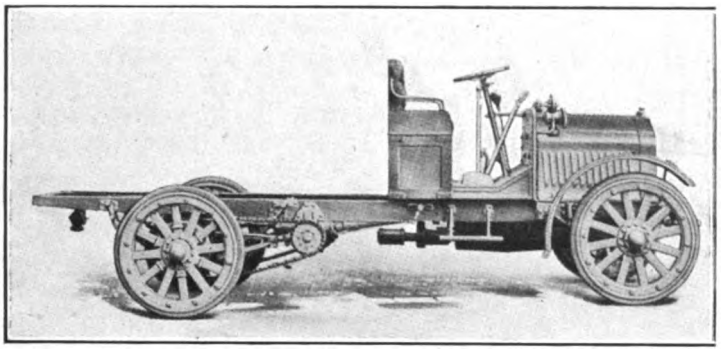
Another new design is the Moon, although a light delivery wagon was displayed by the Moon Motor Car Company, St. Louis, Mo., at a show in that city about a year ago. The model shown at Chicago may be regarded as new, however, since it has a rated capacity of 1.5 tons, against 1500 pounds for the older machine. It follows standard practise throughout, utilizing a four-cylinder, L head motor, three-speed selective transmission and live rear axle.

The Moore, made by the Palmer-Moore Company, Syracuse, N. Y., is the only representative of the two-cycle type among the 24 new machines. The motor has three cylinders, with four-inch bore and stroke, and is air-cooled, being fitted with shutters in the intake and exhaust ports which are under the control of the driver for throttling purposes. Aside from the motor the chassis follows standard practise and does not differ materially from the first vehicles which were brought out by this concern about a year ago.

The Avery Company, Peoria, Ill., has a new Avery farm tractor, which differs from the two-ton machine previously produced, largely in the matter of carrying capacity. It is rated at three tons. Four other models were shown, these being trucks of one, two, three and five tons. Some of these are new, in that motors of new design have been incorporated, but the construction may be regarded as following standard practise.

The Adams Bros. Company, Findlay, O., presented its new two-ton truck, which was described at some length in a recent issue. The line is particularly interesting because of the use of block motors, on which the oil pump, water pump and magneto are driven by a worm drive transverse shaft at the front of the crankcase. The hinged, sloping hood, with radiator behind it, is still retained.

The Clark, made by the Clark Delivery Car Company, Chicago, has adopted the automatically advanced Eisemann magneto for ignition on its block motors. The gearset is of the individual clutch type, the gears always being in mesh. Motor positions vary in the different models, being under the seat with some and under a hood in others. The two-cylinder horizontal engines have been discontinued.



Another View of the Individual Exhibits, Taken in Front of the Gramm Stand.

The Little Giant, made by the Chicago Pneumatic Tool Company, Chicago, continues the two-cylinder engines in two models, one of these being supplied with a planetary gearset and the other with a sliding gear transmission. A new model has a four-cylinder motor and three-speed selective transmission.

The chief feature of interest, aside from the substantial construction which follows standard practise in the main, on the six-ton Mogul trucks, made by the Mogul Motor Truck Company, Chicago, is to be found in the tire equipment. This consists of rubber cushions and a series of steel

Digitized by Google

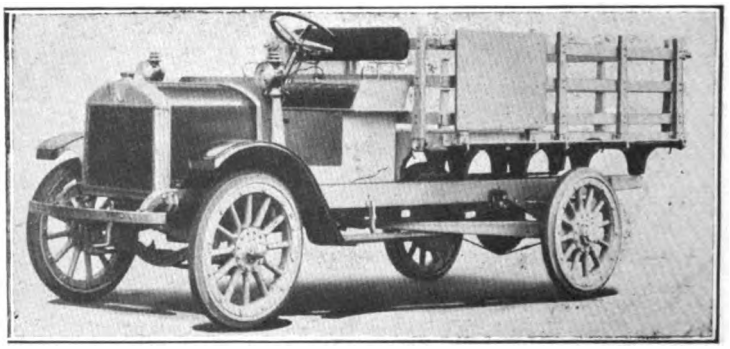
Side View of the First Selden One-Ton Model.

blocks forming the tread. It is contended that the metal resists wear by reason of its hardness and that the sharp edges grip the road and hold the truck in line should there be any tendency toward side slip.

The Old Reliable, made by the Old Reliable Motor Truck Company, Chicago, shows a change in its braking system. On the four-ton model the countershaft brake is a Kline, in which the brake is actuated through an eccentric instead of a toggle arrangement.

There does not appear to have been decided change in the following: Harder, Harder Auto Truck Company, Chicago; Natco, National Motor Truck Company, Bay City, Mich.; Jeffery, Thos. B. Jeffery Company, Kenosha, Wis.; United States, U. S. Motor Truck Company, Cincinnati, O., and Mercury, Mercury Manufacturing Company, Chicago. The last named is fitted with high wheels, and the motor is a two-cylinder opposed unit, air cooled.

The Sampson is a continuation of the older machine of that make, assumedly to be produced by the new Maxwell Motor Company. The Hercules is a new product of the Flanders Manufacturing Company, which also is now a part of the Maxwell concern. It is a one-ton wagon, following standard practise, although a departure is noted in the use of square spokes in the wheels. This is held to make for greater strength.



The three electrics shown for the first time this year at Chicago are not new in the strict use of the term. The Walker, made by the Walker Vehicle Company, Chicago, is notable for its balance drive mechanism, which was first revealed a year ago. The Buffalo, produced by the Buffalo Electric Vehicle Company, Buffalo, N. Y., virtually is the old Babcock, which was continued by the new concern after the incorporation of the larger company last year. The Urban is made by the Kentucky Wagon Manufacturing Company, Louisville, Ky.

In addition to the vehicles already mentioned a number of machines shown for the first time at the recent New York show also were displayed at Chicago and attracted unusual attention. Among these was the one-ton Selden, marketed by the Selden Truck Sales Company, Rochester, N. Y. Because of the prominence of the Selden in the pleasure vehicle field this is of special interest, although it follows standard practise very closely. The motor is a four-cylinder, water-cooled, L head unit with bore of 3.75 inches and stroke of 5.25. The clutch is a multiple disc. The transmission is selective. Final drive is by side chains. The driver is located on the left with control in the centre.

Another new model this year is the worm driven Universal, made by the Universal Motor Truck Company, Detroit, and rated at one ton. Except for the worm, the construction is in every way conventional. This is assembled with the differential in the full floating rear axle. A unit power plant is employed, this being suspended at three points. The driver is at the left with centre control.

Last year the A. O. Smith Company, Milwaukee, Wis., exhibited a five-ton worm driven model at Chicago. This year it presents the Smith-Milwaukee six-ton vehicle, which is held to be the largest machine equipped with the worm drive yet produced in this country. It offers other features of construction which are distinctive.

The transmission gearset, the driving shaft and the rear axle are a unit. The large torque tube is enlarged at the forward end and joined with the gearcase, the tractive effort being ex-

One-Ton Worm Driven Universal Truck.

Digitized by Google

tended through this tube against the heavy frame cross member that supports the forward end of the transmission case. The relation of the torque tube is preserved by large radius rods that extend to it from the ends of the rear axle housing.

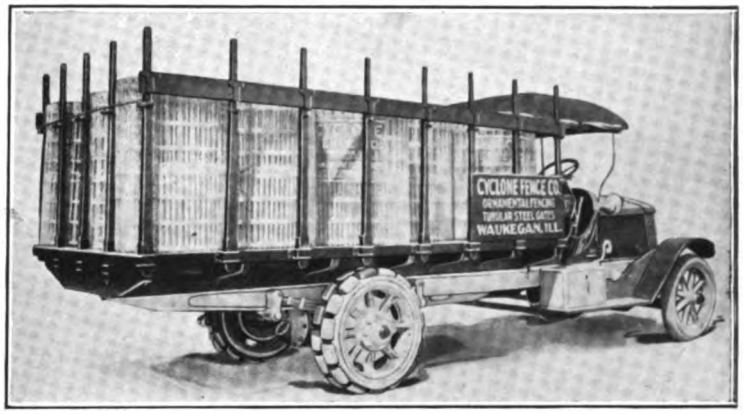
The individual clutch type of selective gearset is unusually heavy and has constantly meshed herringbone gears. The shafts of each are mounted on three large bearings and the entire mechanism is suspended from the cover of the case, so that it may be removed by taking out the cover retaining bolts.

A pressed steel housing is used for the rear axle, instead of a casting. The chassis also is noticeable for the use of steel cored wheels, with the brake drums cast integral, the spokes being semi-circular in section, united by heavy webs. Another feature is the skeleton radiator frame, which is designed to increase radiation. The motor has a bore of 5.25 inches and stroke of 5.75.

NEW MARMON CATALOGUE.

Radical Departure from Usual Treatment of the Subject in Text and Drawings.

A catalogue which makes its appeal to those who are interested in the artistic treatment of motor car subjects is that describing the Marmon line for 1913, just issued by the Nordyke & Marmon Company, Indianapolis, Ind. Particular attention must be drawn to the illustrations, which include a number of drawings by a well known eastern artist, depicting the Marmon in various scenes of interest in this country and abroad. The frontispiece discloses the New York Central station in New York City. Other views include: The bathing beach at Atlantic City, one of the shopping districts at Newport, Fifth avenue, Imperial valley in southern California, quaint street in the Netherlands, etc.



The chief value of the book lies in its unusual treatment of the text, which is made entertaining to those not fully versed in the technical points of automobiles. It may be added that an effort has been made not to confine the argument to any one make of car, but to give a description of automobile building that is of practical and lasting benefit.

PABST TROPHY RACE.

Milwaukee Planning to Hold Big Meet Without Vanderbilt and Grand Prize Events.

Undaunted by the failure to secure a hearing before the Motor Cup Holding Company to set forth claims for the Vanderbilt and Grand Prize races, which will this year be held at Savannah, Ga., the Milwaukee, Wis., men who are behind the racing forces in that city, are making plans to stage a big race meet in Milwaukee in which the Pabst Trophy will be featured. Large cash prizes will be offered to induce racing drivers and their machines to enter the contest.

After the recent Motor Cups Holding Company's meeting at which the 1913 races controlled by the organization were awarded to Savannah, it was believed that Milwaukee would join the newly formed Western Automobile Association and secede from the American Automobile Association. L. E. Meyer, secretary of the Milwaukee Auto Dealers' Club, disclaims any such intention, as he says it is realized that the A. A. A. had nothing to do with the award of the races to the Georgians. Milwaukee has had a costly experience in road race promotion, he stated, but with this experience and many months' time to formulate and put in operation plans for the Pabst Trophy race, he believes the city will more than demonstrate its ability to hold a successful meet.

Six-Ton Smith-Milwaukee Worm Driven Machine.

Bars Criminals as Chauffeurs—The Bussey bill in the New York legislature provides that no license shall be issued to a chauffeur who has been convicted of a felony, and authorizes the secretary of state to revoke the license of a chauffeur upon the report of a conviction, and no license shall be granted to the chauffeur in the future unless the conviction should become reversed by the courts.

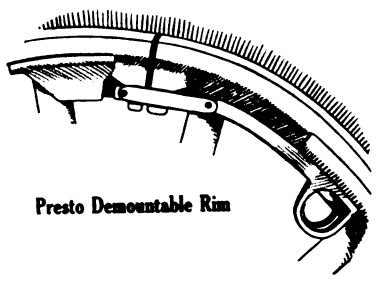
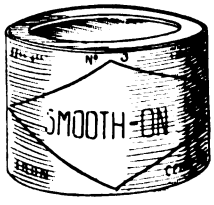
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



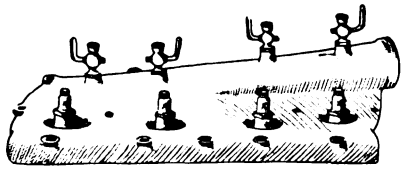
The Presto Demountable Rim, manufactured by the Presto Inter-Rim Company, Boston, is constructed in standard sizes and will fit all straight side, clincher or solid tires. A feature of the rim is the contracting locking ring utilized in conjunction with a safety locking device or toggle, and it is held by the maker that one motion securely locks and holds in position both the rim and shoe. To remove the rim a lever is moved downward, expanding and forcing it off. To replace the new rim and shoe, the tire is mounted on the wheel in the usual manner and with the valve stem placed in its proper position. The wheel is rotated until the stem is at the bottom and the lever at the top. The lever is then moved upward to its normal position where it locks automatically.

—— ★ ——



Danver Priming Cocks are fitted by A. C. Danver, Hospital and Borden streets, Providence, R. I., to model T Ford automobiles. They are screwed into the cylinder head on the left hand side of the motor and their openings communicate directly into the combustion chamber. The cocks are of the conventional type, having liberal sized cups, and are fitted with a spring retained handle. Their function is to provide means for priming the motor without removing the spark plugs and by their use it is possible to locate missing cylinders, introduce kerosene and remove carbon deposits. The priming cocks are moderately priced.

—— ★ ——



Smooth-On Iron Cement is marketed by the S. B. R. Specialty Company, East Orange, N. J., and is included in a repair outfit which also comprises an elastic cement, a roll tape and an instruction book. The iron cement is held to be very efficient for repairing cracked water jackets and leaky radiators. It is claimed that the work may be completed quickly, involving no other labor than cleaning the parts, applying and heating the material. A quality emphasized with the cement is that it is easily worked and completely fills the opening, which may be smoothed over to make a neat appearing job. The two cements are utilized separately or together, depending upon the nature of the repair to be made.

Smooth On Iron Cement

Danver Priming Cocks

Angier Ford Spare Wheel

Calomix

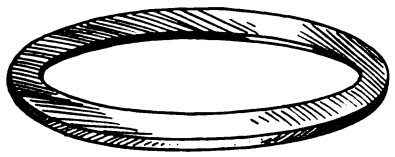
—— ★ ——

The Angier Spare Wheel, made by Angier's, Streator, Ill., is designed for Ford cars and is of the demountable type. It comprises an extra wheel for models N R S or T and will fit either front or rear axles. It is removed by displacing the nuts retaining the hub flanges and this is made possible by replacing the old bolts in the hub with studs having finished nuts. When the latter are removed by a special bit stock the wheel can be displaced quickly and without affecting the bearings, speedometer gear, etc. The equipment comprises an extra wheel, studs, nuts and the wrench member. It is moderately priced and provides demountable features not fitted to Ford cars.

—— ★ ——

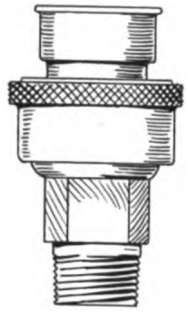
The Calomix, produced by the Calomix Manufacturing Company, Troy, N. Y., differs from those devices employed for converting a raw mixture into a vapor in that provision is made for heating it. It com-

Digitized by Google



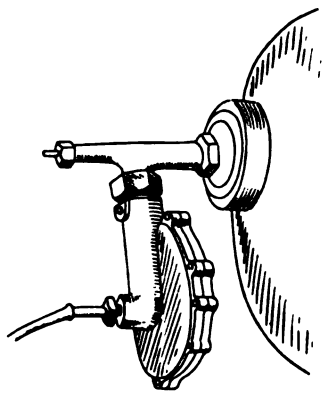
prises a brass gasket about .5 inch thick, conforming to the shape of the flanges utilized on the carburetor and intake manifold, and is placed between these members. In addition to a small fan wheel which rotates and breaks up the raw fuel, the Calomix is provided with passages through which the exhaust gases pass, warming it. Suitable connections are included for fitting to the manifold and various sizes are manufactured to meet carburetor requirements. It is installed easily and is not expensive.

—— ★ ——

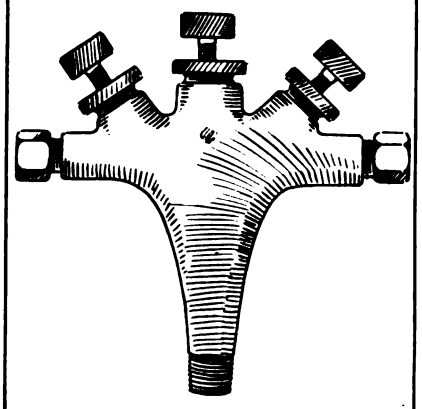


Victor Gaskets are produced by the Victor Manufacturing & Gasket Company, Chicago, in standard forms for a variety of purposes in connection with the motor car. That shown is for fitting between the spark plug and cylinder to prevent leakage and is made in two types, open and closed. Copper and asbestos are employed and when these materials are compressed they make for a perfectly tight joint between the parts. They are made in various sizes and are inexpensive. The company also manufactures special gaskets and issues an illustrated catalogue which will be mailed free of charge upon request.

—— ★ ——



The Tucker Grease Cup, manufactured by W. W. & C. F. Tucker, Hartford, Conn., is a positive lock compression type and is made for service on motor cars and machinery where vibration tends to loosen the head. The locking device is free from ratchets and all parts are enclosed, preventing the entrance of dust or dirt. The maker points out that it may be refilled easily and that the parts requiring lubrication are cared for properly in that the grease flows freely when required by the bearing, etc. The cup is no higher or larger than the ordinary member and is constructed in various sizes, taps for each being carried in stock.



Victor Gasket

Tucker's Grease Cup

Prest-O-Lite Reducing Valve

Bingham Compensator

—— ★ ——

The Prest-O-Lite automatic reducing valve is manufactured by Prest-O-Lite Company, Indianapolis, Ind., and is attached easily and quickly to the gas tank made by this company. Its function is to maintain the correct pressure at all times and this is secured regardless of whether the tank is full, half empty or nearly so. It makes for convenience in that the head or other lamps may be lighted without the usual adjustment of the pressure and that the blaze is such that maximum efficiency is secured. Economy is effected through preventing a waste of gas. The automatic reducing valve is moderately priced.

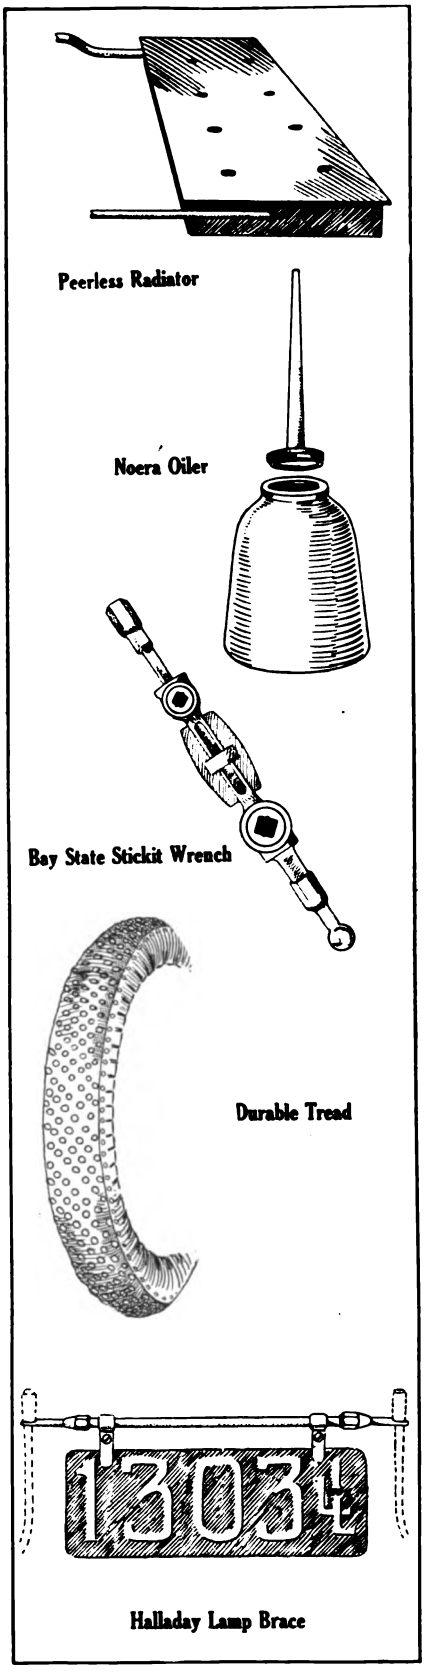
—— ★ ——

The Bingham Compensator is made by the Bingham Manufacturing Company, Cleveland, O., and as the name implies, is designed to regulate or compensate the pressure in the float chamber to which it is attached. It is held by the maker that at high and low speeds there is a differing pressure at the spraying nozzle, but not in proportion to the amount of fuel, making for waste. The Bingham device compensates by reducing the pressure in the float chamber proportionately to the reduction of that at the spraying nozzle. It is provided with two speed adjustments, also a fuel control, and is inexpensive.

—— ★ ——

The Peerless Radiator is designed for heating motor cars and is located in the floor of the machine. It utilizes the

Digitized by Google



hot water from the circulation system of the power plant and is applicable with both thermo-syphon and pump systems of cooling. When the former is employed a connection is made between the pump and the cooler and a second lead attached to top of the water jacket. With the thermo-syphon system one pipe is led to the lower water manifold. It is held that it increases circulation capacity, keeping the motor cooler, especially when an alcohol anti-freezing solution is employed. The home office of the maker is at Gibbs, Idaho, while the New York office is at 275 West 23rd street.

—— ★ ——

The Noera Oiler is the product of the Noera Manufacturing Company, Waterbury, Conn., and a feature is the diameter of the mouth, it being 1.25 inches, as against the usual .875 inch or less. This makes it a simple matter to replenish the supply of lubricant. The oiler is practically a one-piece construction, the bottom being of clock spring steel pressed against the shoulder of the dome, the seam being double turned. The spout and breech lock are similarly constructed, no solder or brazing being employed. It is made in 10 sizes, from three ounces to one pint in capacity, and is finished either in copper plated steel, polished steel, polished brass, nickel plated brass, or steel.

—— ★ ——

The Bay State Sticket wrench set is marketed by G. A. Cutter, sales agent, Taunton, Mass., and comprises a double ended ratchet wrench, strapped to seven strong stamped steel sockets strung on a square steel shank. One end of the wrench fits the shank and the other the sockets. The wrench also fits four sizes of nuts, and with the sockets 11 different sizes of nuts and cap screws. The reversible ratchet wrench is secured to the shank by a substantial leather strap and with the use of a washer prevents rattling. An 1.25-inch ball is fitted to one end of the shank, but may be removed if desired, allowing the sockets to be displaced. The other end of the shank has a ball stop and spring ball for holding the socket in position. It is a compact, practical set and in addition to being adapted for a large variety of work, may be carried easily in the tool roll. Extra sockets are supplied.

—— ★ ——

Durable Treads are marketed by the Durable Tread Sales Company, 524 West 34th street, New York City. They are constructed of two layers of tanned leather between which are placed five thicknesses of fibre fabric. The tread is thickly studded with steel rivets having large solid heads. The treads are secured to the rim by means of patented nickel steel rim hooks which are formed to the exact shape of the bead of the shoe. It is held by the maker that skidding is prevented and that the use of chains is not necessary. It is also claimed that blow-outs are eliminated as the rim anchorage reinforces any weak spot in the casing.

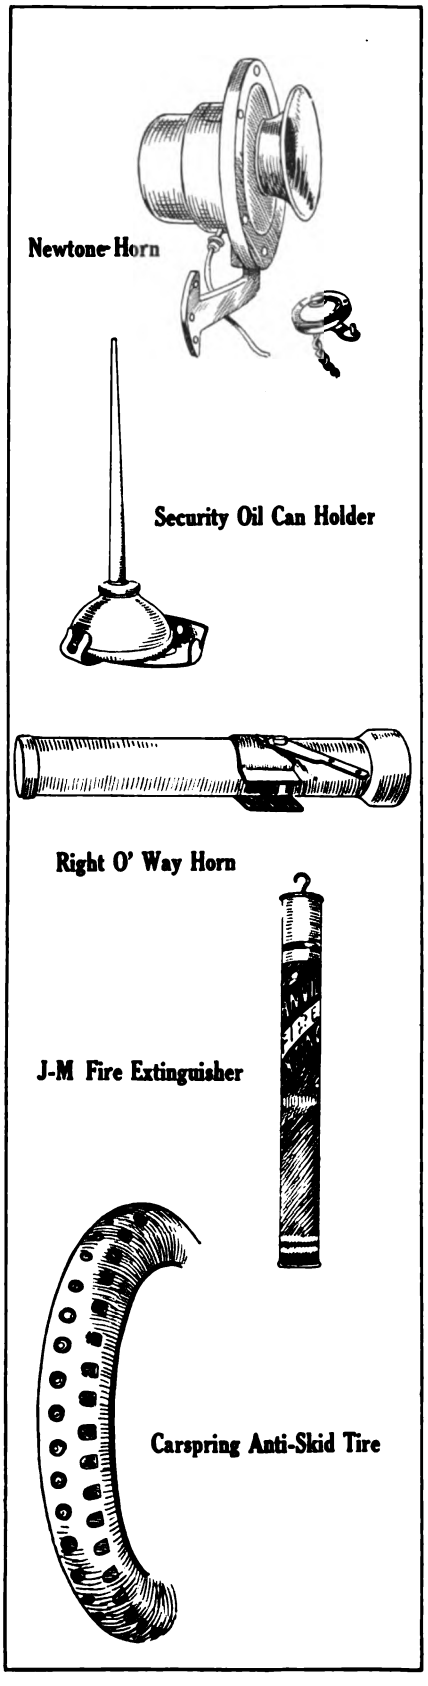
—— ★ ——

The Halladay Lamp Brace and number holder is manufactured by the L. P. Halladay Company, Streator, Ill., and not only eliminates vibration of the lamps, but serves to carry the license number. It is adjusted easily to any car having lamp irons, a form of turnbuckle being employed. The license tag is secured to it by

Digitized by Google

a special clamp and a quality claimed for the device is freedom from motion. It is finished in black japan, brass or nickel and is moderately priced.

★



The Newtone Type N Horn, produced by the Automobile Supply Manufacturing Company, Brooklyn, N. Y., is designed for those who desire a compact, high grade, efficient signal. It operates on a six-volt storage battery or five dry cells and a quality emphasized is the small amount of current required and consumed. The motor shaft rotates on Hess-Bright ball bearings and requires no oiling or adjustment. It is finished in black enamel, nickel or gun metal and comes complete with push button and cable.

★

The Security Oil Can Holder is marketed by the Mayo Manufacturing Company, Chicago, and is designed for retaining the oiler under the hood. The clamp is so constructed that the can may be removed easily by tipping it, and it may be replaced in a similar manner. It will hold cans from three to 3.5 inches in diameter and is finished in copper.

★

The Right O' Way Horn is produced by the Davies-Bach Manufacturing Company, Cleveland, O., and is actuated by the exhaust of the motor. It is operated in the conventional manner, by a pedal or lever, and a clear, penetrating, as well as pleasing, tone is claimed for the signal. It is made in two styles. A being a combined horn and cut-out, while B is for service in states where the cut-out is prohibited. It is held that the horn will not clog, is constructed of high grade material and is attached easily. It is moderately priced.

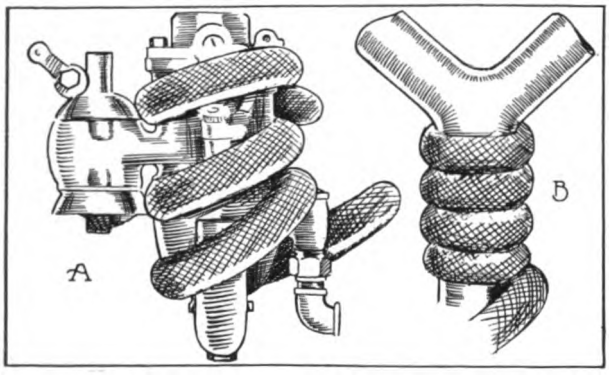
★

The J-M Fire Extinguisher, marketed by the H. W. Johns-Manville Company, New York City, is a compact metal tube filled with a dry powder which is guaranteed to put out any fire in its first stage, arising from gasoline, benzine, calcium carbide, etc., if employed according to directions. It is also warranted not to injure the paint or upholstery of a car and not to freeze or cake in the container. It is constructed in a special size for motor cars, although it is produced for garages and motor boats.

★

The Carspring Anti-Skid Tire is manufactured by the New Jersey Car Spring & Rubber Company, Jersey City, N. J., and is a one-cure wrapped tread shoe having depressions instead of projections. Cups having a convex base at the apex of the tread are employed with semi-circular cups on either side which grade off as the tire rounds out. It is held that this construction prevents side slip and increases traction through the cup forming a vacuum which is broken as the tire revolves.

★



The Holtzer-Cabot Electric Company, Boston and Chicago, maker of the Holtzer-Cabot dynamo system of electric lighting, has established a department at the factory in Brookline, Mass., installing its dynamo on private cars. The company is prepared to equip any type of gasoline vehicle and a large number of owners have taken advantage of the opportunity to install electric lighting systems on machines not thus fitted. Estimates will be furnished upon application.

Digitized by Google

HEATING THE CARBURETOR.

More or less difficulty is experienced in starting a cold motor at this time of the year. The heavy grade of fuel, coupled with freezing weather, brings about a condition that makes cranking anything but a pleasure. The motor starter has reduced starting troubles only to a certain extent. It is misunderstood by some in that they believe the engine will respond even when it has been exposed for hours to exceedingly low temperatures and without priming or assistance. Under such conditions, however, the engine is not likely to start any easier than if it were cranked in the conventional manner.

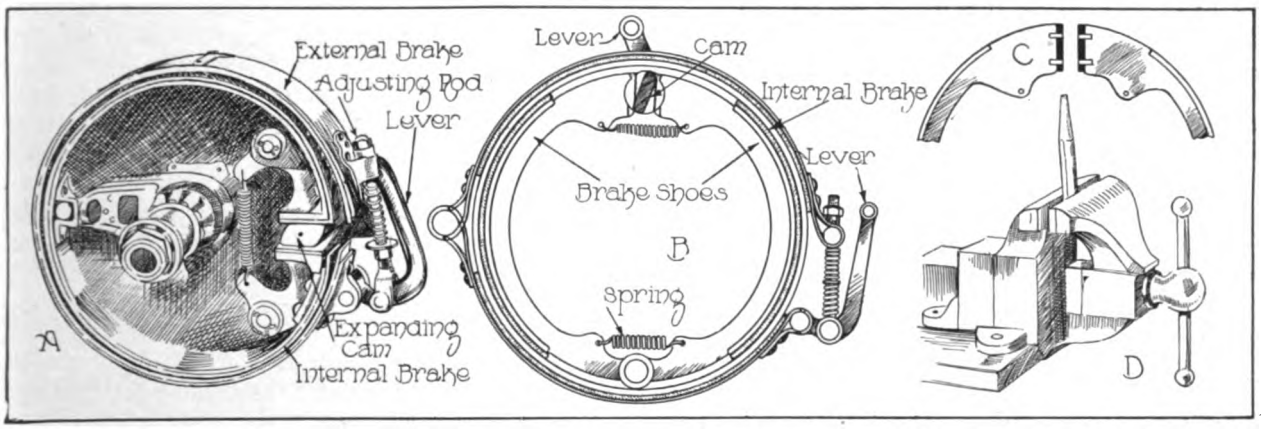
Depicting Method of Heating Carburetor:. A, Utilizing Bag of Heated Sand; B, Wrapping Same Around Intake Pipe.

This contention has been borne out in several instances noted by the writer when machines fitted with motor starters failed to start, although the device performed its function of revolving the crankshaft. In two of these the carburetor was primed or flooded without success and both machines were 1913 models. Both motors, however, were started after priming the cylinders. It should be explained that the weather was exceedingly cold and that the cars had been exposed for several hours. Other owners of machines fitted with motor starters state they have not experienced any difficulty, while a few admit that they prime the cylinders with gasoline, which practise is to be commended.

There is a large number of motorists whose cars are not equipped with motor starters and when the machine has seen considerable service the starting of the motor becomes troublesome, especially if the engine is fitted with an old type of carburetor. The manufacturer of vaporizers has made considerable improvement in his product, such as priming devices and attachments for enriching the mixture from the seat, and with these conveniences on a new motor, starting should not be difficult even with a heavy grade of fuel now utilized.

Although the majority of makers provide means for priming the cylinders in the shape of petcocks, there are motors not thus equipped. Under these conditions it becomes necessary to remove the spark plugs and inject the gasoline, but this method requires time and is not convenient especially if one is in a hurry. While the difficulty may be overcome by fitting special plugs having priming attachments, this means the outlay of from $4 to $6, depending upon the make.

It is well known that low temperatures prevent vaporization of the fuel and this is aggravated when the carburetor and intake pipe or manifold are very cold. Even if a partial amount of vapor is created by the air passing over the spraying nozzle, the mixture is likely to become condensed by coming in contact with the chilled walls of the intake pipe, much in the same manner as steam is turned into water when chilled.



If the carburetor be heated the fuel will be vaporized easily and it will be possible to start the coldest of motors. It is not practical to utilize a naked flame, owing to the danger of igniting the fuel or producing suitable conditions for combustion, but the carburetor and intake manifold as well can be heated easily and without much effort by using hot sand.

Digitized by Google

It is a simple matter to make a sand bag which when filled will be about an inch or more in diameter. The length will depend upon the size of the carburetor and manifold, but it should be of sufficient length to permit of making several wraps around the carburetor and the intake manifold. The manner of applying the sand bag is depicted herewith.

Of course the sand will have to be heated and this may be accomplished by placing it in the oven or on a radiator. It should be heated very hot and this will not require any great length of time. The sand will retain the heat for a considerable period and it is surprising how quickly and easily the carburetor and intake pipe may be warmed by it.

The suggestion is not necessarily confined to the motorist who garages his car upon his premises, as the sand bag could be carried in the car and placed upon a radiator while the owner was making a call and with the machine exposed to the cold. The device can be made in a few minutes, will cost practically nothing and will solve the motor starting problem.

Illustrating Types of Brakes: A, Showing Components of External Contracting and Internal Expanding Design; B, Those Utilized on a Well Known Make; C, Method of Repairing Worn Faces with Metal Strips Retained by Machine Screws; D, Depicting Use of Punch When Riveting New Linings to Shoes.

CARE AND REPAIR OF BRAKES.

With the manufacturer providing more liberal surface, brakes do not require the attention that formerly was true when the bands were narrow. With the large diameter drums and ample face, brakes give maximum efficiency and aside from an occasional adjustment do not give trouble. In time, however, the linings will wear, the amount depending upon their service and the driver. There are a number of conditions that will arise, however, and if the owner is familiar with the principle of brake construction he should be able to make minor repairs as well as adjustments.

Brakes may be divided into two classes, the external contracting and internal expanding types, although these forms may be applied in a different manner; that is to say, the brake drum may be so constructed as to enclose the contracting band. The principle, however, is similar to the external design.

While it would appear a simple matter to adjust either type when they do not grip properly, the novice is apt to so alter the positions of the contracting or expanding mechanism that although the bands grip as desired they frequently drag. This should be avoided as the least friction set up between the linings and the drums not only unduly wears the materials, but wastes power.

When brakes do not hold it does not necessarily mean that the bands need readjusting. It is possible that the friction faces may be covered with oil or grease, a condition that is frequently taken as an indication that new linings are required. When adjustments fail to give the desired results the wheels should be removed and if the facings are impregnated with lubricant they may be cleaned by washing with gasoline. If the grease or oil is working out from the differential into the brake drums, the felt washers should be displaced and new members fitted. Because the lubricant does not work out between the brakes and wheel drum is no assurance that the facings are not greasy.

An accompanying illustration shows two types of brakes, that at A being of conventional design. As the parts are clearly marked the reader should be able to understand their operation. It will be seen that the outer or external contracting band is actuated by a lever and tog-

Digitized by Google

gle joint arrangement and that means are provided for lengthening or shortening the rod opening and closing the brake proper. By shortening the rod the area of the gripping band is restricted.

The internal expanding brakes are operated by a double cam and as these are generally employed for the emergency brakes, there is but little wear of the expanding mechanism. Where they are employed for the service members, the cams will wear in time. When badly worn it may be necessary to fit new parts, but a repair may be effected as outlined at C, this consisting of building up the faces of the brake member. In making this repair care should be exercised not to increase the normal diameter of the shoe and due allowance should be made for the brake lining, else the brakes will drag.

In relining brakes the first step is to ascertain the original thickness of the lining and the material employed. The same width should be secured and the drum measured to obtain the correct length. This is a case of mathematics or the drum may be measured with a string. Brake linings come in varying thicknesses, ranging from .125 to .25 inch. There are several excellent materials for this work and a list will be found in the Classified Buyers' Guide, elsewhere in this issue.

The shoes will have to be removed and this is not a difficult operation. Before attempting to remove the rivets securing the lining to the shoes the latter should be thoroughly washed in gasoline. Some employ a torch to burn off the old lubricant, but the writer prefers the washing process. The shoe is next clamped in the vise and the peined-over rivets cut off with a sharp cold chisel and a hammer. The rivets can then be driven out with a punch.

Next clean the shoe and secure one end of the new lining to it by clamping the parts in the vise, taking care that the facing is even or flush with the edge of the shoe. In attempting his first operation the novice is apt to fit the lining unevenly, but by observing caution the band should be free from wrinkles and be true.

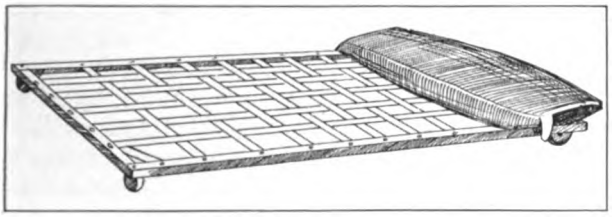
With the shoe and lining held securely in the vise the drill is run through the rivet hole in the shoe and lining and the latter well countersunk so that the head will be well below the contacting surface of the lining. After drilling a number of holes and inserting the copper rivets the shoe is removed from the vise and a punch gripped in the jaws as shown in the drawing. The shoe is then held on the punch so that the head of the rivet is in contact with the top of the punch. The small end of the rivet may then be peined over. Care should be taken to have the heads well countersunk in the lining when the work is completed.

In reassembling the brakes all springs should be tested to note if they have proper tension so that the linings will not drag. If they have lost their elasticity new ones should be fitted. After adjusting the brakes, jack up the wheels and note if they drag. A simple method is to place a hand on the brake drums after a short run and note if they are warm. If so the adjustments should be altered as this is a good indication that there is undue friction.

GENERATORS AND COLD WEATHER.

Some owners take precautions to prevent the water in the circulation system from freezing, but forget the generator. The fluid in these members will not freeze when the car is in motion or the device is generating gas, particularly in the latter instance, as considerable heat is developed. If the generator is water jacketed, the fluid should be replaced with anti-freezing solution. If the car be exposed for any length of time and the lights are not left burning, remove the water chamber member and place it where it is warm. It takes but a few seconds and may save considerable expense as well as annoyance.

At the first meeting of the officers and board of directors of the Motor Dealers' Contest Association of New York City, the principal thing accomplished was the appointment of the chairmen of the various committees which will have to do with the managing of the organization. Following are the appointments announced: Executive committee, Inglis M. Uppercu; exhibition, C. H. Larson; entertainment, Arthur J. Inderrieden; publicity, John C. Wetmore; racing, George Robertson; membership, Edward F. Korbel; house, S. S. Toback; grievance, H. M. Bonner; finance, James C. Nichols; road contests, William J. Morgan; auditing, A. B. Cordner; touring, Emanuel Lascaris.



Joseph Seymour, the former automobile racing driver, has returned to the automobile business from the field of aviation and has joined the selling force of the New York City branch of the White Company, Cleveland, O., maker of White pleasure cars and trucks. Seymour raced in two Vanderbilts, the Grand Prize, the Briarcliff and Lowell events and one of the 24-hour contests at Brighton.

EQUIPPING THE PRIVATE GARAGE.

Part IV.

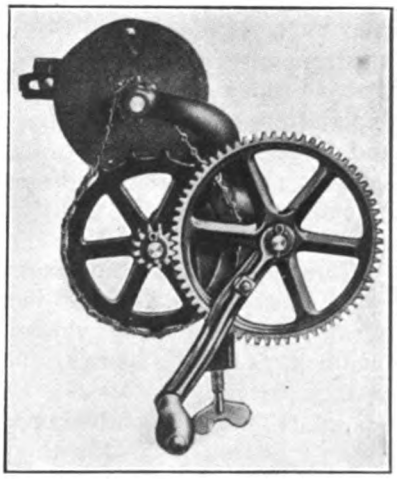
Some owners do not care to go to the expense of building a pit and while it is a decided con-

A Creeper Is of Value When the Garage Is Not Equipped with a Pit.

venience it may be dispensed with and a creeper employed. This is practically a bed or rest, in that the workman may lie upon it when under the chassis making an adjustment. It is of value in that the wearing apparel is kept from contact with the greasy floor and the operator is not as likely to catch cold through lying upon the cement, etc.

Creepers are not expensive and in an accompanying illustration is presented a serviceable type marketed by the Milwaukee Auto Specialty Company, Milwaukee, Wis. It is constructed in two styles, one having roller casters and the other a countersunk ball caster. With either design the workman may roll under and out from beneath the chassis with little effort and the device is a considerable improvement over the old mat or coat employed by some.

The creeper is constructed from one-inch angle iron with the corners turned and riveted and the network is one-inch flat band steel, riveted to the frame. Being flexible it conforms readily to the shape of the body, making for comfort. The head rest is of enamelled duck, filled with a suitable material. The frame is of aluminum, neatly enamelled and the entire construction is very light and durable. The dimensions are 36 inches long by 15 wide, and this style is 2.5 inches from the floor. The other design is two inches from the floor. A creeper may be constructed by one handy with carpentering tools, but the cost of the ready made article is such that it is more advantageous.



Selecting the Tools.

As previously pointed out it is more advisable to purchase a small number of high grade tools than a large quantity of inferior make. A practical equipment may be secured by buying one or two at a time and if not familiar with the makes one may consult a friend who is experienced mechanically. While there always are bargain sales of tools, the novice will do well to make sure the tools are made by a reliable firm and are not defective.

In the matter of monkey wrenches the writer favors, as do most repairmen, an all metal tool such as the Coes. It is constructed to withstand severe service and comes in varying sizes to meet individual requirements. Two or more of these will be invaluable and one should be at least six or eight inches, and if possible a much larger one for heavy work. The number of S wrenches may be limited if the box or socket wrench outfit previously mentioned is to be included in the equipment. If not, a complete set of S members will be necessary. They may be purchased in sets of one or two at a time as required. As the majority of cars provide a number of these tools and special members, it may be possible that only a few extra ones will be needed to complete the set. A Stillson also will prove serviceable.

Good Pliers Necessary.

At least two pliers will be necessary, one of the ordinary type and the other for cutting purposes. These should be of good quality and it is not economy to select cheap ones as they are generally useful. A breast or hand drill should be included and a two-speed member is preferable. While one may be purchased for about $1, it will be found that the chuck capacity is limited. It is advisable to select one of good construction, having a chuck capable of taking at least a .5-inch drill. The drills may be purchased with the tool or picked up a few at a time. They are not expensive and by buying them singly a complete set can be accumulated in a short time.

The Luther Dimo-Grit Grinder.

Screw drivers are called upon to do really hard work and one should be secured at least 10 inches long and of the metal forging type—one

Digitized by Google

in which the central shank extends through the handle formed of two wooden pieces. A smaller member can be included for lighter work, and one having an all wood handle is best as it will be of service in testing out the ignition, the handle preventing shocks to the operator.

A grinder is a valuable addition to the equipment of the garage, especially when the owner effects his own repairs. Drills and cold chisels become dull and require resharpening, and frequently a part must be reduced slightly to make a fit. Making special sized bolts or taper pins are necessary in some overhauls. With a grinder the work is made easy and considerable time, as well as stock, is saved.

The Luther Grinder Manufacturing Company, Milwaukee, Wis., produces a large variety of grinders and in an accompanying illustration is shown the No. 46 tool. It is heavy enough to take care of all ordinary work and will handle fine edged tools. It is designed to be clamped to the bench or other convenient place and is operated by hand, energy to the wheel member being transmitted by a chain. The gearing is such that a proper grinding speed is assured at little expenditure of muscle. The bearings are wide and fitted with dust caps, and parts subject to stresses are constructed of malleable iron. An extended and threaded shaft permits of the use of several wheels at one time if desired.

The equipment comprises a medium grit grinding wheel, six by 1.5 inches, a felt polishing and a cloth buffing wheel. A foot power attachment is listed as extra. The grinder is moderately priced.

Files and Hammers.

In selecting files only those of good quality should be purchased. A large coarse file will be needed for rough cuts, while flat, half-round and square mill files about eight or 10 inches long will be of service generally. The three-cornered and "rat tail" members also will be useful.

If possible include three hammers. Two should be of the machinist ball pein type, a light and a heavy member. Some prefer the latter to weigh about 12 ounces, while others may desire a heavier tool, or one weighing 1.5 or two pounds. The third hammer should have a head of copper, lead or reinforced rawhide for driving out bolts without damaging the threads.

Cold chisels are inexpensive and one is warranted in selecting at least three, these including those with a .25, .5 and .75-inch cutting edge. The diamond point and round nose may be added if desired. In purchasing a hacksaw it is advisable to buy one having an adjustable frame so that different sized blades may be fitted. A few extra blades will be required until one has mastered the use of this tool and at least one should have fine teeth for cutting light tubing.

Miscellaneous Tools.

A centre punch is useful and a set of drifts or closed punches may be obtained at a slight cost.

Tool Equipment.		Supplies.	
Coes Wrenches	Cutting Pliers	Soldering Flux	Friction Tape
Breast Drill	Centre Punch	Dixon's Graphite	Shellac
Hacksaw	Solid Punch	Brush and Can	Waste
Stillson Wrenches	Adj. End Wrench	Cotter Pins	Taper Pins
Screw Drivers	Lead Hammer	Hex. Cap Screw	Hex. Nuts
Gasoline Torch	Tin Snips	Emery Cloth	Lock Washers
Bearing Scrapers	Wheel Puller	Oil Cans	Abrasive
Soldering Iron	Carbon Scrapers	Solder	Hand Soap
Machinist's Hammer	Steel Rule	Grease Gun	Oil Gun
Pliers	Valve Lifter	Copper Wire	Iron Wire
Socket Wrench Set	Spring Spreader	Prussian Blue	Packing
Files	Cotter Pin Extractor	Cup Grease	Gasket Material
Cold Chisels	Hacksaw Blades	Light Oil	Kerosene

A Complete Set of Tools and Line of Supplies May Be Secured by Purchasing a Few at One Time.

The small ends should measure .0625, .125, .25, .375 and .4375 inch. A steel rule, tin snips, cotter pin extractor, bearing and carbon scrapers and a valve lifter may be included in the equipment, although some of these members may be made.

A gasoline torch, solder and flux are handy in the garage and there are a number of useful purposes to which the torch may be put. While the list may appear rather formidable to the novice, and the entire equipment involve the expenditure of a considerable sum, many of the tools listed may be secured at very reasonable prices. A number of supply houses issue catalogues, illustrating and describing the parts as well as giving the cost of each tool. Among the houses mailing complete data upon tool equipment are Chas. E. Miller, 97-103 Reade street, New York City; the Bi-Motor Equipment Company, 177 Portland street, Boston, and the Waite Auto Supply Company, Providence, R. I.

(To Be Continued.)

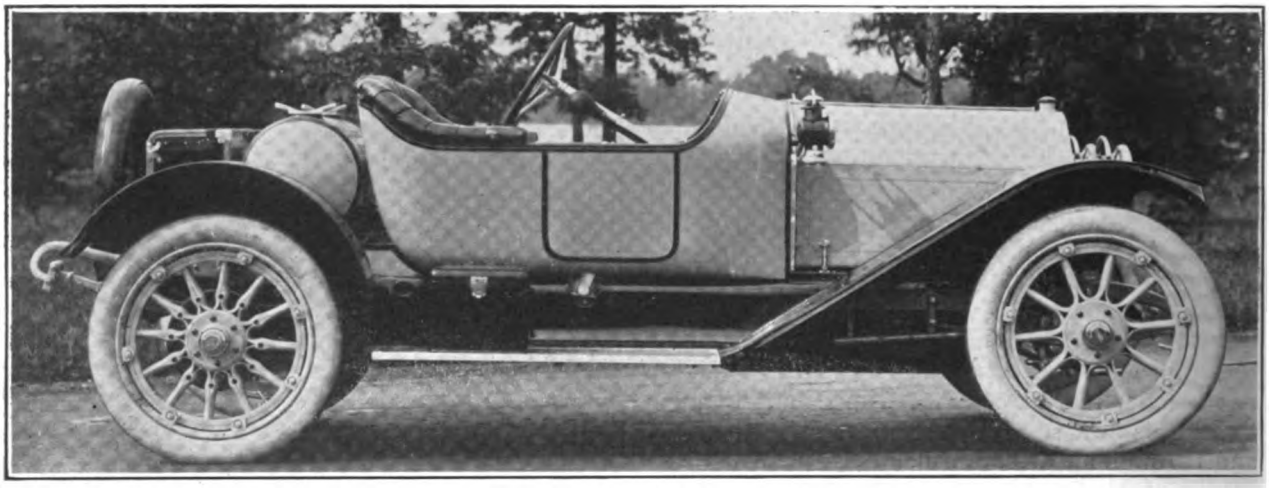
STUTZ LINE INCLUDES NEW SIX CYLINDER.

THE Ideal Motor Car Company, Indianapolis, Ind., maker of the Stutz car, is manufacturing a six-cylinder chassis in addition to a four-cylinder, and the new models will be known as series B. To each chassis will be fitted a four and six-passenger touring body and a two-passenger roadster. While the design is the same as the series A, minor changes have been made, these being in the nature of refinements. Among the improvements are a larger capacity radiator and heavier rear axle and transmission. Electric lighting is now standard equipment on all models and throughout attention has been paid to those details of construction that make for economy in upkeep and convenience in operation.

The new six-cylinder power plant is of the same general design as the four produced last year and with the exception of bore and stroke, wheelbase and ignition, the description of the larger machine will apply to the new four-cylinder car. The efficiency and durability of the Stutz construction has been amply demonstrated in speed and endurance contests during the past two seasons and the machines have made a very favorable impression among their owners.

Both motors are of the T head type with cylinders cast in pairs and water jackets integral. The bore and stroke of the six-cylinder unit is 4.25 by five inches, that of the smaller motor 4.75 by 5.5. A fine grade of gray iron is employed and special attention is given to the machining and grinding process as well as the fitting of the pistons and rings. It is stated that the four-cylinder motor has developed 60 horsepower on a block test at 1500 revolutions a minute. The cylinders are offset .75 inch.

The crankshaft is hollow, two inches in diameter and constructed of 40 point carbon steel. It rotates in three large bearings of ample length and the seats and bearings are carefully scraped in. The connecting rods are of the I beam section type and are bushed with Parsons' white bronze. The bearings are two inches in diameter, 3.5 long, and the caps are retained by four bolts. The wristpins are of hollow tool steel, ground and hardened. The camshafts are of high grade steel and rotate in large white bronze bearings. The pushrods are ample in size, of the roller type, have extra long bearings and actuate nickel steel headed valves 2.5 inches in diameter. All valve mechanism is enclosed by an aluminum housing split in the centre and retained by a simple spring device.



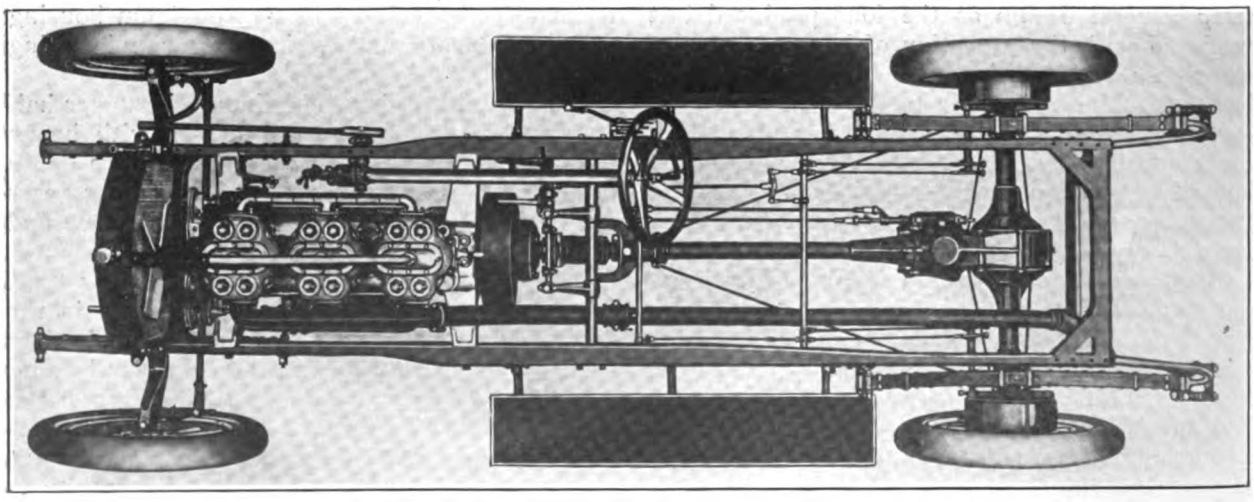
Stutz Six-Cylinder, Six-Passenger Touring Car Having Straight Line Body—A Two-Passenger Roadster and Four-Passenger Touring Body Also Are Fitted to This Chassis.

The crankcase is of aluminum, the upper half supporting the crankshaft bearings with heavy webs extending through the entire centre depth of the case, insuring rigidity. The timing gears are of the spiral type with extra wide face and rotate in a bath of lubricant.

The oiling system is of the circulating type. The lubricant is pumped from the sump in the lower half of the crankcase through a main duct cast integral with the crankcase to ducts leading to each crankshaft bearing, thence through the hollow crankshaft to each connecting rod bearing. The overflow returns to the sump, where it is filtered and used again. The oil capacity is seven quarts and a glass gauge on top of the

Digitized by Google

Four-Cylinder Stutz Roadster, Having Attractive Lines and Low Centre of Gravity.

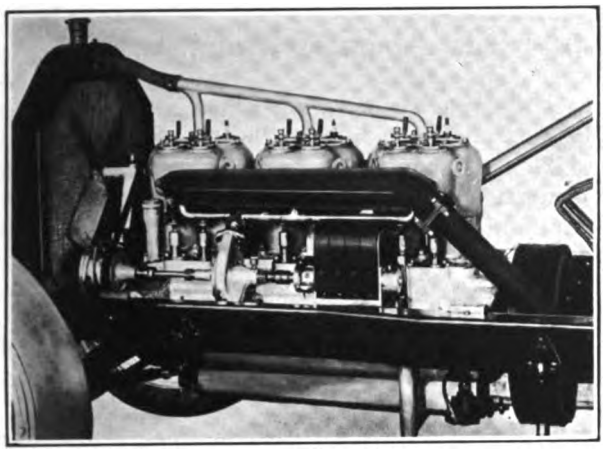


crankcase denotes the amount in the reservoir.

Carburetion is by a Stromberg located on the right hand side of the motor and the magneto is mounted on the same side, an improved Eisemann being fitted to the larger motor. A Splitdorf magneto with double distributor is employed on the four-cylinder.

Cooling is by a four-inch genuine honeycomb radiator, the fluid being circulated by a centrifugal gear driven pump located on the left side of the motor. Cooling is further aided by a fan of special design, belt driven and provided with means for adjustment. The clutch is a multiple disc, steel against steel, and operates in a bath of lubricant. The transmission is larger than in former models and is integral with the rear axle. It is of the selective type, providing three speeds forward and reverse with direct drive on the third speed. The shafts are of a high grade steel and large annular bearings are employed.

The semi-floating Stutz special rear axle is larger than formerly, the differential case having been increased two inches in diameter. The axle shafts are supported at the differential end by tapered roller bearings which not only take care of the load, but take up all end thrusts. The outer ends of the axles are supported in large annular bearings, these being similar in design and construction to those utilized on high grade foreign cars. The axles have squared ends and the wheels instead of being keyed on have a round taper fit, making for a substantial construction. The axles may be removed easily by taking off the bearing retainer. Provision is made for the adjustment of the mesh of the driving pinion and bevel gear by removing two small plates on either side of the differential case exposing an adjusting collar.



The drive is a straight line by shaft and a double knuckle universal joint is fitted back of

Plan View of Series B Stutz Chassis—Note the Straight Line Drive and Accessibility of Components.

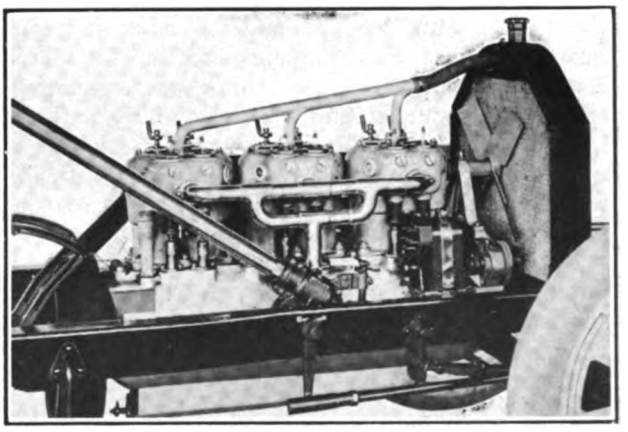
the clutch. The drive is through a torsion tube and fork attached to a torsion bracket on a cross member of the frame. The springs are semi-el-

Exhaust Side of Stutz Six, Showing Method of Driving Lighting Dynamo Through Water Pump.

liptic with graduated leaves and are held by double shackles with hardened and ground spring bolts, bored for lubrication by grease cups. The frame is of pressed steel with channel of 4.5 inches and width of section three inches in the centre. There is a kick-up of 2.5 inches at the rear and the frame is in-swept three inches in front, providing for a short turning radius. It is well braced by three cross members.

A Timken drop forged I beam section front axle is employed and is designed to have 100 per cent. overload capacity. The steering knuckles are very large and roller bearings make for durability as well as for easy steering. The brakes are of the internal expanding twin type with drums 14 inches in diameter and 4.5 wide, faced with an asbestos lining. Equalizers are provided and all braking mechanism is enclosed.



The wheels are sturdy, having 10 1.75-inch spokes in the front and 12 in the rear, the last named being bolted to the brake drums. Tires are 34 by 4.5 inches on both chassis and Baker demountable rims with one extra member are standard equipment. The steering gear is a Gemmer worm and gear type having thrust bearings at the top and bottom of the worm gear. All parts are bushed. The steering post is two inches in diameter with an 18-inch wheel having an aluminum spider and rim cast in one piece. The wheel proper is of English walnut. The spark and throttle levers are located on top of the wheel and have an extra wide quadrant.

The driver is placed at the right and the control levers are inside the body on all models. The clutch pedal is at the left with brake at the right, the accelerator being placed between these members. The gear shift lever operates in the conventional H quadrant. The wheelbase on the four-cylinder chassis is 120 inches for the roadster and 124 for the touring types. That on the larger chassis is 130 inches for the touring cars and 124 for the roadster. The tread is standard, 56 inches.

The Esterline electric lighting system is fitted to each model and the dynamo is driven by the shaft actuating the water pump. The Esterline system has been fully described in these columns. The headlights are straight electrical units, but the side and tail light are combination electric and oil. All lamps are finished in nickel and black.

The passenger capacity of the Stutz bodies differs from conventional practise in that they are two, four or six-passenger types, the company holding that this design makes for a more even distribution of weight and maximum tire service. The bodies are noticeable for rich upholstery and attractive straight lines. Ample room is provided in all models, both in the front and tonneau. The roadster bodies are particularly striking because of their racy appearance and low centre of gravity. They carry a large combination fuel and oil tank at the rear, also a trunk and tire irons. The standard colors are vermilion and green chassis and Mercedes red, maroon and Napier green bodies.

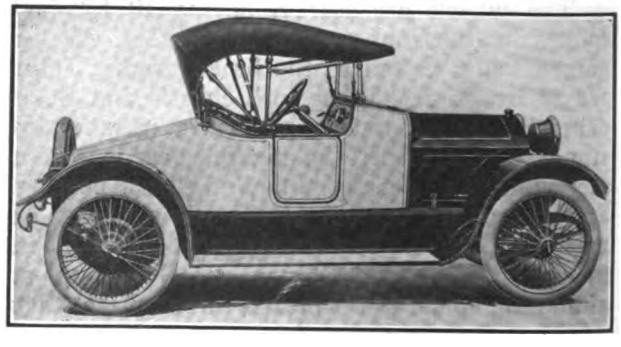
FEATURES OF WIRE WHEEL CONSTRUCTION.

Some Advantages Claimed for this Type of Suspension--Reasons Advanced by Its Advocates for Expected Popularity with American Motorists.

SINCE 20 per cent. of the motor car manufacturers exhibiting at the recent shows announced they were prepared to furnish wire

An Early Type of Wire Wheel Utilized on American Cars.

wheels either as regular equipment, at an option or at an extra cost, it will not be denied, perhaps, that the subject contains something of interest to the automobile owner. The wire wheel enthusiast predicts that in 1914 a majority of the new American machines will be fitted with these members. There must be some reason for this apparent change in sentiment, if it be true that it exists in such proportions.



The first practical automobiles produced in this country utilized wire wheels, but in many instances these were bicycle wheels. There followed an attempt to adapt this type of construction to the peculiar conditions prevailing with the heavier vehicles. The result was not such as to compare at all favorably with the possibilities of wood wheels, at least insofar as American road service was concerned.

Wire wheels have continued to enjoy wide popularity abroad, particularly in England, where several conditions combine to create a situation very different from that which has existed in this country. In the first place English wood is lacking in structural strength when compared with American hickory, and the other woods available—French cypress, for example—are lacking in other desirable qualities, and while it may be contended that the wire wheel in England was the result of necessity rather than choice, there is little question that the superior road surfaces in Great Britain have afforded its use under the best possible conditions.

There does not appear to be any need for securing a change in wheel material in America, unless it can be demonstrated that the new possesses advantages not contained in the old. Contrary to an opinion which has been gaining ground more or less during the past two years, it is stated by those who should be in a position to know that the supply of hickory stock is still far from being exhausted.

The superiority of the American wheel has hitherto depended largely upon the quality of the stock, and hickory of proper quality is not a standard commercial article, but a specialty. It cannot be purchased in the open market. Wheel makers send their inspectors into the forests to select the timber, and to the mills to sort just such stock as is suitable for automobile wheels. John Kelsey, a man who has been engaged in the hardwood lumber business for several years, states that the hickory used in making 200,000 cars a year—12,000,000 spokes and 2,000,000 felloe rims—is simply a drop in the bucket compared with the vast amount of timber in the South, where hard woods predominate, and where there always will be found a liberal percentage of hickory.

If, then, there is no reason for fearing a shortage, and it is conceded that automobile wheels made from American hickory are the best wood wheels to be found, why should the industry re-

An American Machine Equipped with 1913 Model Wire Wheels.

vert to a type which virtually had been abandoned as unsuitable? Simply because the wire wheel of today bears very little resemblance to

Digitized by Google

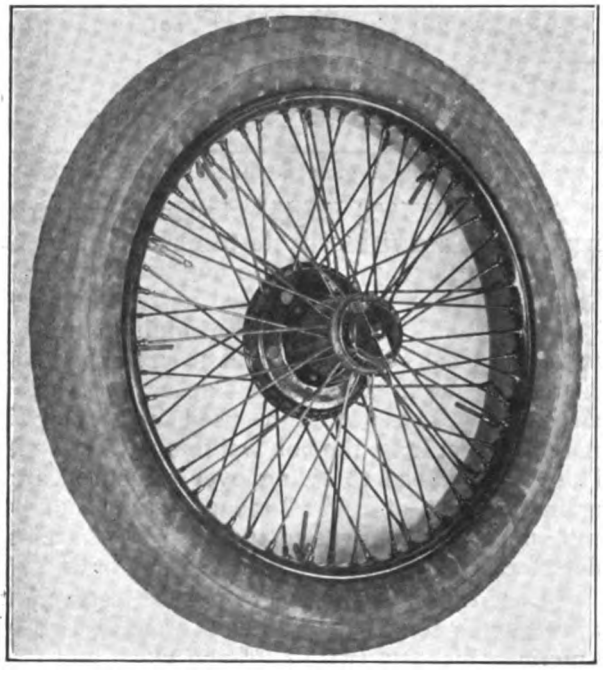
that of the earlier period. It is maintained that the British constructors found that even under the superior conditions for its use in that country, the older types of wire wheels failed to give proper service. One of the greatest troubles was the loosening of the spokes, while another was the tendency toward rusting. Both of these difficulties are held to have been entirely eliminated through a complete redesigning of the construction, and the special treatment of the material. In other words, the development of the wire wheel has been along lines very similar to those which have governed the other components of the automobile.

Among the advantages claimed for wire wheels are the following: Increased tire mileage, reduction in weight with resulting increase in fuel mileage, increased strength, improved riding and driving qualities, improved car appearance and superior demountable features. Some of these must be considered a matter of personal opinion, reference being had particularly to the item of improved car appearance. Others are susceptible to proof, and it is purposed to present such evidence as is available at this time.

In the matter of tire economy, the following letters to the editor of The Motor Car Journal, a British motoring print, are of interest:

While it has been quickly realized by the observant car owner that wire wheels make for greater strength and safety, and at the same time secure a considerable reduction of dead weight, their beneficial effect upon the life of tires is not so generally known, and we therefore trespass upon your space to record the results of certain experiments which have been carried out by our hire department in London. There careful data have been kept of all tire replacements and repairs, and the following figures show the mileage obtained on heavy covered cars from 100 non-skid 935 by 135 mm covers, half of which were fitted to wire, and half to wooden wheels:: Total mileage obtained from 50 non-skid 935 by 135 mm covers taken from wire wheels, 172,731 miles; average, 3454. Total mileage obtained from 50 non-skid 935 by 135 mm covers taken from wood wheels, 102,524 miles; average, 2050. Average miles per cover, 3454 on wire wheels. Average miles per cover, 2050 on artillery wheels. As the cars employed were practically identical, and were run under exactly similar conditions, the results are very instructive.

Yours truly,
THE DAIMLER COMPANY, LTD.



The data furnished by the Daimler Company based on 50 tires on cars with wood wheels and 50 on cars with wire wheels (the cars being otherwise identical) show that wire wheels reduce the tire bill by over 40 per cent., or, put another way, wire wheels save 2¼d. a mile with the size of car and tire used. The net cost of fitting an artillery-wheeled car with Rudge-Whitworth detachable wheels varies from £30 to £40, so that the total cost of the change would be saved in under 4500 miles except in the case of very light cars, where it would probably take just over 6000 miles to save the first cost. The reduction in tire bill would of course continue after the saving had been effected. It is hardly necessary to add that these wheels can be fitted to any make of car.

Yours truly,
JOHN V. PUGH.

Similar installations are not to be found in this country. A few cars fitted with wire wheels have been run hundreds of miles, but practically the sole opportunity to study the tire situation has been in connection with the use of such equipment on racing cars, and this only during the 1912 season. The following letter sets forth the experience of one of these machines with a wire wheel made by the McCue Company, Buffalo, N. Y.:

We wish to inform you that your wire wheels stood up nobly well in both the Vanderbilt and Grand Prize races on the Stutz car.

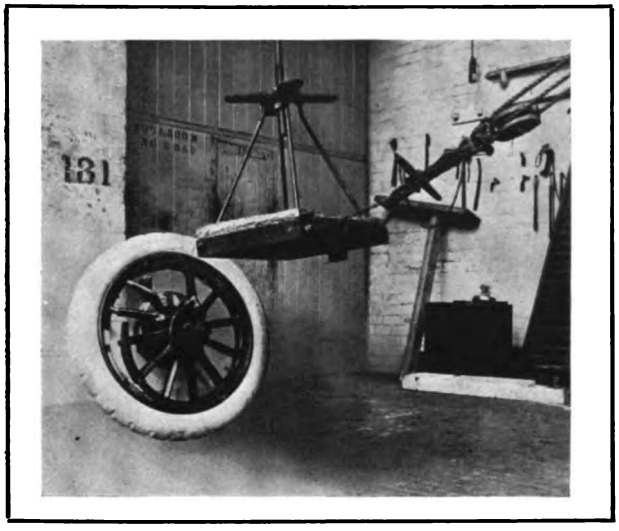
We found it necessary to only change one rear tire in the Vanderbilt race and one rear tire in the Grand Prize race, the front tires going through both races, the Vanderbilt and Grand Prize, without a change and the two rear tires that we changed in both races were simply on account of worn tread and not due to loss of air. Upon examining the spokes of these wheels, after going

McCue Wire Wheel Used on Stutz Car in Vanderbilt and Grand Prize Races of 1912.

through both races, we did not find one loose spoke or a wheel the least out of true.

This performance has not only converted the writer to wire wheels, but has caused him to give an option of wire wheels on future Stutz cars.

None of the wheel locks loosened a particle, in either race, and were just as secure at the finish as they were in the start.



We wish to congratulate you on your wheels from a practical standpoint and wish you every success you deserve.

With best personal regards, beg to remain,
Very truly yours,
IDEAL MOTOR CAR COMPANY,
H. C. STUTZ,
President and General Manager.
Indianapolis, Ind., Oct. 9, 1912.

Engineers contend that the use of a multiplicity of fine spokes creates a large number of air currents, which are deflected about the tires and tend to keep them cool. This is a condition

Digitized by Google

that seems to be borne out by statements made in this letter, although the subject of strength is touched upon in a measure as well.

Wood Wheel Undergoing Dynamic Pendulum Test.

As early as 1908 English designers were engaged upon a series of tests to demonstrate the comparative strength of wire and wood wheels. American hickory was selected as the standard for the latter. The dynamic pendulum method was employed, this being held to correspond to the violent termination of a side slip against a curbstone. The pendulum used was approximately 11 feet long, the bob weighing 480 pounds. This was allowed to swing over measured arcs against the rim of a wheel mounted on a dummy hub spindle, which was in turn a part of a massive steel bar secured to a concrete monolith.

In one of the most recent of these tests, eight wheels were selected, two being of wire, two of American hickory, two of French wood and two of steel plates. Five blows were given each wheel, with the results shown in the following table:

Total Permanent Deflection in Inches.*

Type of wheel	Weight in lbs.	Blows 1	2	3	4	5
Wire	29.2	.36	.60	.90	1.16	1.49
Wire	30.0	.31	.55	.82	1.18	2.56
American	46.0	.28	.46	.67	.89	1.17
American	47.0	.21	.32	.84	1.41	2.20
Steel	36.5	.59	1.06	1.60	2.14	2.80
Steel	37.7	.53	1.05	1.60	2.17	2.79
French	38.7	.27	.45	.84	4.88	...
French	39.5	.25	.41	.64	1.07	4.60

*The effect of each blow should be taken into consideration with the above, and was as follows, taking the wheels in the order given:

First wire—No damage.

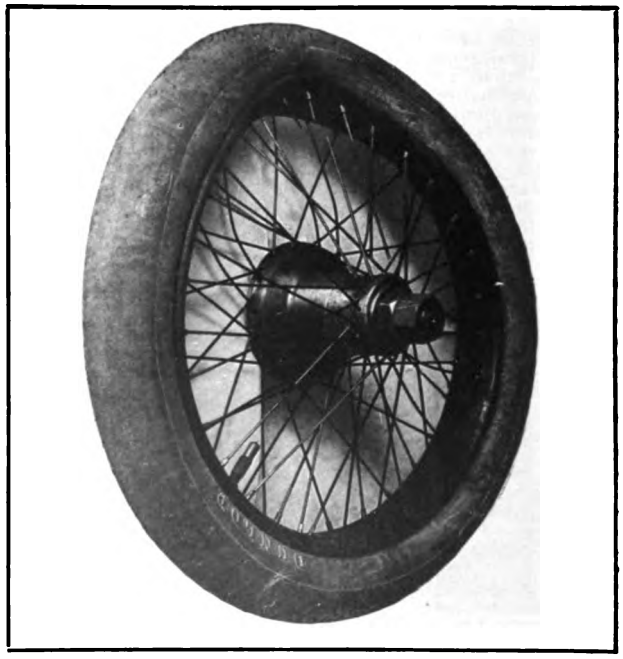
Second wire—Five spokes broken and two nipples pulled through on fourth blow; two spokes broken and two nipples pulled through on the fifth.

First American—Two spokes cracked on second blow; flange cracked on third; four spokes cracked on fourth; two bolt heads cracked on fifth.

Second American—One spoke cracked on second blow; rim moved on third; rim moved, one-quarter of felloe split and three spokes broken on fourth; felloe smashed on fifth.

First steel—Buckled at hub on second blow; hub badly buckled on fifth.

Second steel—Hub buckled on fifth blow.



First French—Three spokes split on first blow; six spokes broken on second; one spoke broken on third; wheel smashed on fourth.

Second French—Four spokes cracked on first blow; five spokes cracked on third; seven spokes broken on fourth; wheel smashed on fifth.

An accompanying illustration shows Hugh Hughes in a Mercer car, during the Elgin race of last year. It is stated that the weight of the car was thrown upon this right front wheel in this manner at every round of the circuit, and at the end of the race the wheel showed no ill effects. The following letter to the Standard Roller Bearing Company, 50th street and Lancaster avenue, Philadelphia, maker of Rudge-Whitworth wheels under license from the British manufacturer, indicates in another manner the experience of the Mercer Automobile Company:

You may be interested to learn of a very severe involuntary test to which we subjected a set of 32x4 Rudge-Whitworth wheels recently, owing to an unavoidable accident.

Our Mr. Wishart was driving our "Special" at a speed better than 75 miles an hour, when without warning a small boy on a velocipede ran out in front of him, making it necessary for him to either kill the boy or take to the ditch, and he chose the latter. He encountered a ditch which was about 18 to 20 inches deep, at an angle of about 20 degrees, and both front wheels went clear to the bottom, as inspection showed, and came out again,

Rudge-Whitworth Wire Wheel at Completion of Dynamic Pendulum Test.

plowing, however, very deep furrows in the heavy sod, and when the rear wheels struck the ditch, adding to the momentum already imparted to the car as a result of the front wheels striking the ditch, the car turned over

Digitized by Google

sideways and endwise, landing on top of a fence bottom side up with the motor still running.

Examination discloses the fact that there wasn't as much as one spoke bent in either of the wheels, although the front axle was twisted practically a quarter of the way around.

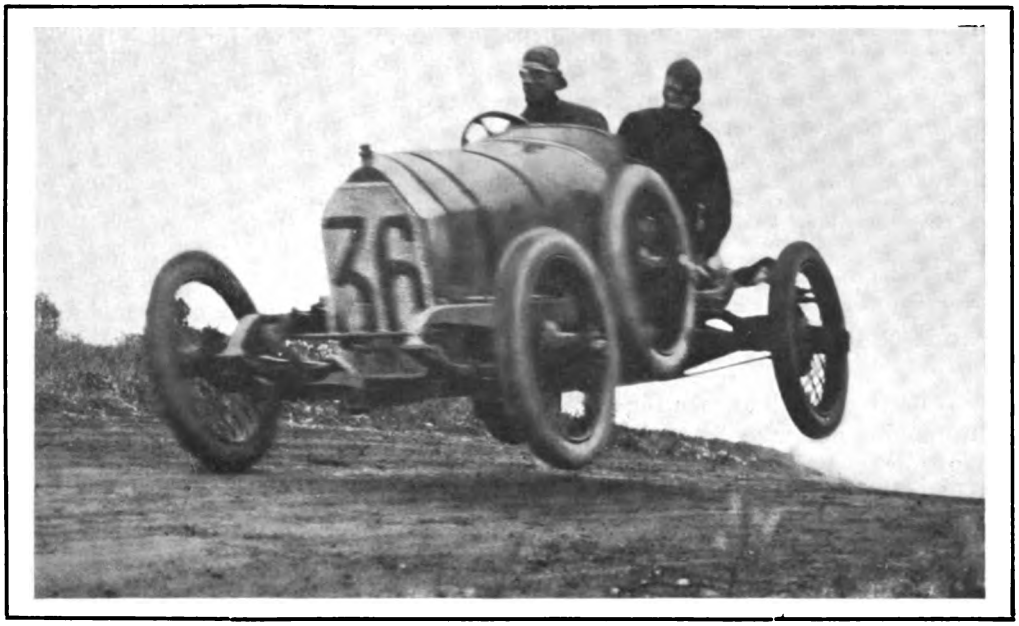
Neither man was hurt in the least, except that Mr. Wishart had a cut near the eye from broken goggles, and I feel sure that their lives were saved by the wire wheels alone. There is no question in my mind but what wooden wheels would have crushed under the weight of the impact, which would have resulted in the car turning abruptly over endways, and owing to the construction of the body, escape would have been impossible. Inspection of the scene of the accident makes it almost impossible to believe that the car and occupants could have escaped so easily, and yet such is the fact.

I write you this knowing you are interested in this particular make of wheels and assure you that my respect for them is beyond expression.

Yours very truly,

FINLEY R. PORTER,

Engineer Mercer Automobile Company.



Trenton, N. J., Dec. 2, 1912.

Inasmuch as the average weight of wire wheels is about 30 pounds, while that of American hickory members is at least 45, it is maintained that a set of five weighs about the same as four of the wood. While superior demountable features are claimed for the wire wheels, it may be stated that some manufacturers have solved this problem as applied to wood wheels. And it also is worthy of note that the development of the demountable rim has been carried much further in this country than in Great Britain, where demountable wire wheels have received the most favor heretofore. However, the use of the latter is held to obviate the necessity for the former, with a corresponding decrease in weight.

Superior riding qualities are claimed because the wire wheel is a suspension member. Seventy spokes are employed as against 12 or 14 in the wood wheel. Automobile engineers contend that the American wood wheel is a suspension member, something that cannot be produced abroad with the woods available. The suspension principle with this type is held to have been obtained by cutting the felloe from the whole stock and shaping it under hydraulic pressure.

Little attempt has been made herein to do other than call attention to some of the advantages claimed for the wire wheels, and to present some of the arguments on both sides of the question. There are several engineering problems involved, concerning which there is a diversity of opinion among wheel makers. These are held to be solved by the design and construction of the individual make of wheel. Space does not permit of taking up the detail description of types available, although it is planned to present these in early issues.

There remains one other suggestion in connection with the use of wire wheels, and that is the ease with which repairs may be made. Attention has been called to the demountable feature, by means of which it is a simple matter to replace a wheel and damaged tire with another wheel carrying a fully inflated shoe. Naturally, provision is made for quick detaching of the tire itself, and it may be added that certain rim makers in this country have been devoting their attention to the production of quick detachable and demountable rims for wire wheel service. It is maintained that practically the only need for repairs will be found in the possible necessity for replacing a broken spoke. The process involved is not unlike that which prevailed when bicycle wheels were utilized. With the detachable or demountable rim removed, the ends of the spokes are easy of access and the work of replacement is one which takes but little time or effort.

MEETING AMERICAN INVASION.

It has been well known for some time that the automobile manufacturers in France and Germany, as well as those in Great Britain, were much disturbed concerning the rapid growth of importations from this country. There has been some disposition, particularly in Great Britain, to ridicule the product of American makers, but the results for the past year have been such as to indicate in no unmistakable terms that this policy is far from satisfactory. A few British producers are now seeking to offset this American influence by marketing cars at less price or by adopting an installment system.

A committee of French manufacturers visited America last year in an effort to study the situation at first hand and learn in what manner it would be possible for them to meet the competition. Apparently, they had difficulty in solving the problem on that basis, as is evidenced by the following notice received by certain American producers:

The French customs regulations prohibit the importation into France or the admission into France in transit of goods bearing the name of a manufacturer or a business firm which is established in France.

This is based on an old law, passed in 1892, but it would appear to offer a substantial barrier to many American cars, either in themselves or because of the accessories used on them, unless the interpretation placed upon it by the French customs officials be found faulty. Not only does it reach the manufacturer, but the tourist as well, and when this last phase of the situation is understood by the French people it is quite possible that another interpretation will be forthcoming.

THE STATE BOUNDARY LINE.

In explanation of the proposed amendment to the Connecticut motoring law, providing that the reciprocity provision shall not apply to non-resident owners of motor trucks except for 10 days in any calendar year, Secretary of State Phillips is quoted as saying: "The business men of Connecticut do not object to competition, but they do object, and reasonably, too, to the advantage to the outsider." This is taken as an indication that the present very liberal motoring law is to be amended, if at all, because mercantile houses outside the state are maintaining motor truck delivery service in towns across the border.

It seems to be difficult to make it understood that the mechanical transport is an economic factor in the world's business history. If, for instance, New York City merchants are able to use motor vehicles to advantage in competing with the business men in Fairfield county, it also is possible for the market gardeners of northern Hartford and Tolland counties to compete in the same manner with Hampden county farmers in the market centring in Springfield, Mass. The same problem arises at every state line in the country.

The Connecticut doctrine, if such it may be termed, is new. New Jersey excluded both pleasure and commercial motor vehicles, but on the ground that visiting cars destroyed the roads toward the construction and maintenance of which they failed to contribute. Experience showed plainly that this was a decided mistake, strictly from an economic viewpoint.

Last summer the village of Bellevue, Ky., undertook to exclude motor truck service from business houses in Cincinnati, O., but within a month has withdrawn the court action it began to enforce its system of registration, ostensibly to pro-

Digitized by Google

tect its roads. It needed less than six months in this instance to demonstrate that as an economic proposition the position taken by the Bellevue officials was wrong.

NEW LEGISLATIVE POLICY.

Early in the month the secretary of state for New York invited motorists, automobile organizations, manufacturers, dealers and motoring publications to a conference at his office in Albany, at which were discussed the various measures now before the New York legislature. A short time since the secretary of state for California commissioned the automobile clubs in that state to draw up a bill for a motoring law which should meet with their approval.

This is a decidedly new policy in legislative matters. If it works well in these two states, and there seems no reason why it should not, it may be tried in others. In view of the situation, organized motorists will do well to consider still more carefully the proposition of uniform motoring regulations and other reforms which are needed. There may yet be opportunity to see these enacted into law.

APPORTIONING ROAD MONEY.

Motor car owners have been willing to overlook their constitutional rights in the matter of special taxation, in the form of registration fees, largely because there has been disposition to use this money for road construction and maintenance. There has been need for a long campaign of education in order to demonstrate the value of better highways.

If the motorist must continue to bear more than his just proportion of this expense he should at least be assured that the money thus contributed is used wisely. Americans still have much to learn in the science of road building, and the utmost progress cannot be expected until the American system of politics is eliminated from the application of the funds.

The subject is brought directly to notice by the fact that the levy court of New Castle county, Delaware, on the main line between Philadelphia and Washington, is seeking to change the present motoring law of that state so that registration shall be made with the clerk of the peace in the county of residence instead of with the secretary of state. The evident purpose of the bill is to secure a different apportionment of the automobile road funds.

The Delaware Automobile Association very properly objects to the enactment. The cost of administration of such funds in the various commonwealths is quite sufficient under the plans now in operation without multiplying the sources of expense. There should be some other method of insuring that New Castle county shall secure its proper share of the good roads money.

NATIONAL SHOW SITUATION.

In some respects the present discussion regarding the annual show situation is one of the most important which has engaged the attention of the automobile industry in recent years. That there is lack of unanimity in the opinions as expressed by those most directly concerned is by no means surprising. At least there is abundant evidence that the subject has been given serious consideration.

The national show formerly was held for the purpose of interesting dealers in the new products of the manufacturers. The season's models were withheld for announcement at this time. Its legitimate purpose, as is true of the local show, was to stimulate business. But since makers have adopted a policy of announcing new models so early in the season, the dealer who has not contracted for his supply of cars previous to the holding of his local display has little need of business stimulation.

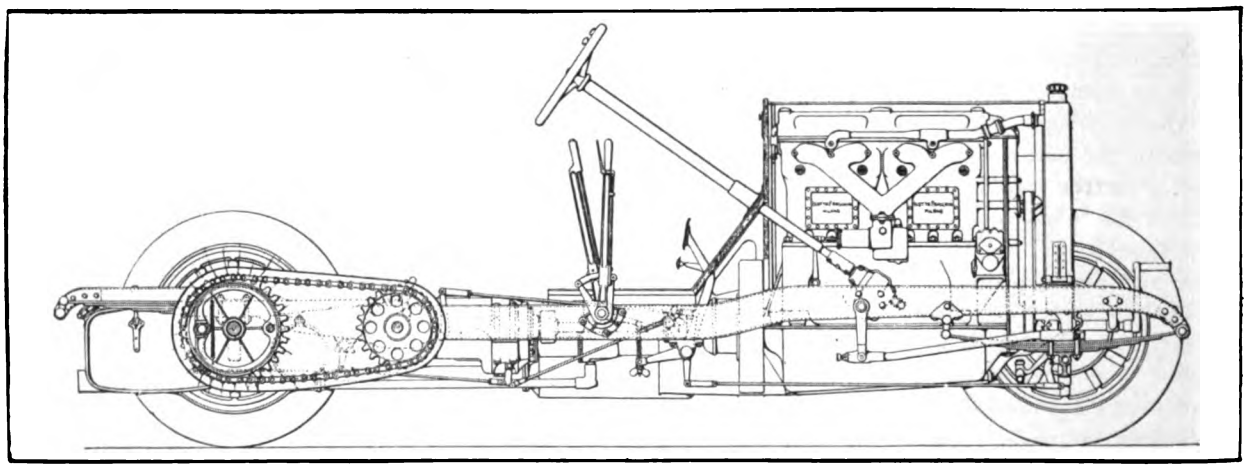
Were the question simply one of expense, there does not appear to be much reason to doubt that similar results could be secured for less money. The problem involves reaching the greatest number and in the most advantageous manner. Whatever decision is reached must be with a view to benefiting the entire industry.

REDUCING TRANSPORTATION COST.

The main thing, according to the Boston Post, in the question of the high cost of living, is to reduce the cost of transporting farm products to the market. Massachusetts has failed to appreciate this factor if it permits its legislature to enact into law the bill now pending to restrict the size and weight of motor vehicles utilizing the public highways.

Digitized by Google

A chassis that presents a number of interesting features is the 100-120 horsepower Isotta Fraschini, made by the Fabbrica Automobili Isotta Fraschini, Milan, Italy. The illustrations herewith are presented by courtesy of Charles H. Fuller, Jr., Pawtucket, R. I., who owns one of these machines, purchased through the Isotta Fraschini Motors Company, 1849 Broadway, New York City, the American representative.

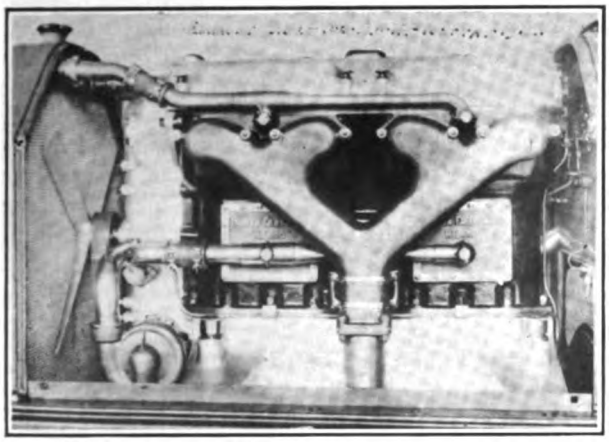


The motor has cylinders cast in pairs, the bore being 5.12 inches and the stroke 7.87. The valves are of the enclosed overhead type, there being four for each cylinder, two on either side. These are operated by overhead enclosed camshaft and rocker arms, running in oil. In fact, all moving parts are enclosed by aluminum covers, thereby making for quiet operation.

Lubrication is by a circulation system, held to be absolutely automatic in operation. A gauge on the dash indicates the rate of circulation which is maintained by a gear driven pump. Suitable drain cocks are provided. The carburetor is a special Zenith and the magneto is a Bosch.

The clutch is a multiple disc member, running in oil. The transmission is of the selective type, affording four speeds forward and reverse, with direct drive on the fourth. The construction is of special design held to permit semi-direct drive on the other speeds, another factor making for silence.

Drive is by double side chain, and these are protected by metal covers, so constructed as to form an integral part of the distance rods. These guards have no hinges or moving joints, and are held to be so simple that they may be removed in a few minutes. The fuel tank is at the rear, feed being by air pressure maintained by a small automatic pump.



A particular feature is the braking system on all four wheels, this being considered a decided element of safety. One set of emergency brakes operates on rear wheel drums, while a second emergency set comprises the Isotta Fraschini patented front brakes. The latter are operated by lever and may be used in conjunction with the rear members or independently as desired. In addition, the chassis is equipped with two water-cooled service brakes located on the jackshaft.

Side View of 100-120 Horsepower Isotta Fraschini Chassis for 1913 Season, Illustrating General Construction.

Digitized by Google

The advantages claimed for the front wheel brakes are as follows: More stability of the chassis at any speed, whether the brakes are ap-

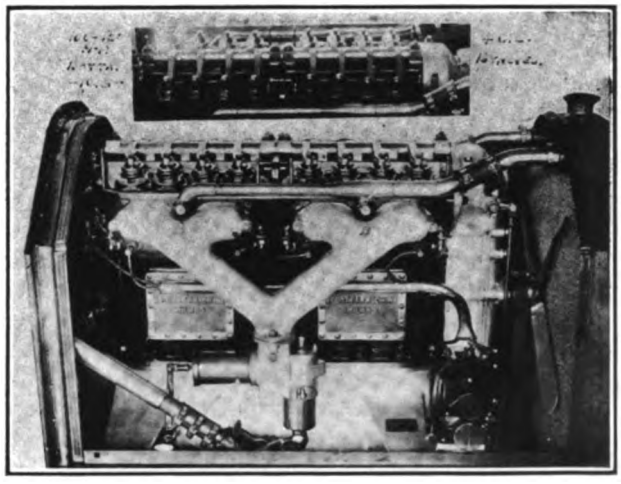
Exhaust Side of Isotta Fraschini 100-120 Horsepower Motor.

plied simultaneously or not; skidding reduced to a minimum; doubled braking power, which makes stopping quicker and safer, without noise or violence; less wear and tear on tires; greater speed on long, steep descents.

Two lengths of wheelbase are offered, one of 124 inches and the other of 130. The tread is 55.87 inches. The tires are 920 by 120 mm or approximately 36 by 4.75 inches.

—— ★ ——

Comprehensive tests of solid tires in England, covering the use of 37 British motor trucks ranging in size from one to six tons capacities, have been completed recently with interesting results so far as tire mileage is concerned. The trucks represented six different makes, including some motor omnibuses, and the average of the vehicles was 17,409 miles a set of six tires, based upon the consumption of three sets to each truck. The compiler of the figures, A. E. M. Turner of London, in commenting on the comparative service of tires, stated that with one exception the British tire makers were behind those of European manufacture and that the American tires were as good or better than those produced on the Continent.



—— ★ ——

The recent successful application of a propeller working in the air as a means of propulsion both for a road vehicle and a canal barge has been followed by some interesting experiments by French officers in Algiers with a kind of sledge mounted on six wheels, driven by a 50 horsepower motor and similarly equipped with a propeller. This vehicle, which carries three persons, travels easily over the rolling sand at a speed of 12 to 18 miles an hour and is said to be able to climb gradients of one in five. This vehicle it is believed will solve many of the difficulties of transportation in the Sahara desert, as well as in Turkey-in-Asia, Persia and in northern Africa.

—— ★ ——

It appears that France has adopted a novel means to decrease the importation into that country of many of the most prominent foreign cars. An old French customs law of Jan. 11, 1892, which prohibits the importation of all foreign products bearing any mark that might suggest French origin, has been revived for this purpose. The law has been elaborated upon apparently, for notice was recently received at the Detroit factory of the Michelin Tire Company, from the headquarters at Milltown, N. J., to the effect that "the French customs regulations prohibit the importation into France or the admission into France in transit, of goods bearing the name of a manufacturer or a business firm which is established in France." This prohibition would include Michelin tires, Dunlop tires, Goodrich tires, Palmer Cord tires, S. R. O. French bearings, Bosch magnetos, Mea magnetos, Zenith carburetors, Bougie spark plugs, Knight motors, Continental lamps and many other articles.

While no specific reference is made in that law to the customs treatment of American products manufactured by a company having a branch factory in France, such as the B. F. Goodrich Company, Akron, O., it would seem that a strict interpretation of article 15 of the customs law of

Intake Side of Isotta Fraschini Engine, Showing Valve Location, Etc.

1892 would exclude such products from importation into France unless properly marked. The enforcement by France of this law is an almost

Digitized by Google

direct bar against American made cars unless they are shipped to France and completed there, because so many articles of French origin or articles made in America and sold through selling agencies in France, or articles made in America originally and now manufactured in French factories established by the American makers, are used in the construction of American made automobiles.

—— ★ ——

A French financial newspaper, commenting on the small number of entries of French automobiles in the Grand Prix race for 1913, says: "Only 18 automobiles have been entered to participate in the Grand Prix of the French Automobile Club, which will be run in July next over a course near Amiens. This is very unsatisfactory, especially when one considers that only eight of these cars are French. For when it is remembered that the number of automobile builders in France is greater than in any other country, it is easy to understand that if our constructors had merely done as well as those of other countries the Grand Prix of 1913 would be at least as interesting as the races of recent years. On paying double entrance fees automobile builders can enter their names up to March 1, 1913. One can still hope that they will profit by this occasion that is offered them to change a really regrettable decision." This small entry list and the opportunity offered of late entry on paying double fees may be of interest to American firms desirous of increasing their export trade and of bringing their cars to the attention of a class of buyers to whom their machines are as yet unknown.

—— ★ ——

The light in which the invasion of the American automobiles is regarded by the German automobile makers, is told interestingly by Adolph Schreiber, the representative in Germany for the Paige-Detroit Motor Car Company, Detroit, maker of the Paige cars. "No one," he states, "realizes as well as the manufacturers in Germany the fallacy of the argument that the American high priced car can never compete with their products. They know the influx of the cheaper American cars now taking place will educate the people to American products and therein lies the danger. Where will this importation stop? The German government and the manufacturers are working as one against our products. The Motorwagen and the Automobilbetrieb are being 'boycottiert'—that is, no German manufacturer of automobiles and parts will run any advertisement in these journals so long as they accept American copy."

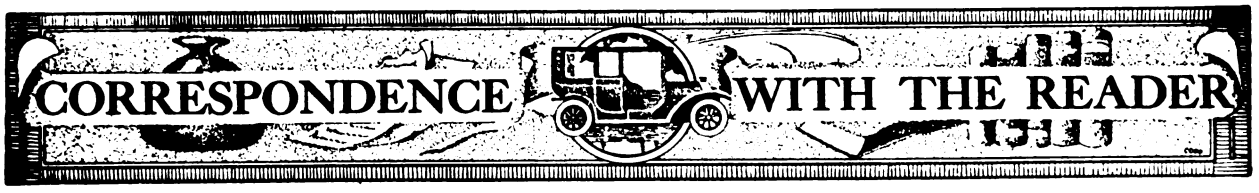
It is estimated by M. S. Friede, Russian representative of the Ford Motor Company, Detroit, that in the whole empire of Russia there are only 6000 cars, or not as many as can be found in many American cities. This is due largely to the fact, he states, that there are no roads, save cart trails, in the country except the highways connecting one or two of the largest cities. There are 1500 Ford machines in use in the empire, these machines being used for the first line of taxicabs ever operated there. However, as Czar Nicholas is a motor enthusiast, his encouragement is bound to increase greatly the number of cars and also lead to road improvements.

—— ★ ——

During the past summer it is said that 6500 motor tractors have been breaking new land for crops next year in the Canadian west. Putting their daily average at the extremely low figure of 10 acres a day and allowing them 60 days' work during the season, this would represent 3,900,000 acres of new land for 1913, and to this must be added many more thousands that have been broken by horses and oxen.

—— ★ ——

An American now in business in a thriving agricultural and manufacturing province in Europe informs an American consulate that he would like to secure an agency for a cheap runabout that can be converted instantly into a delivery wagon. He saw such a vehicle several years ago in the United States which sold for not more than $500. He is sure that a considerable business can be done with it among the farmers, but will not consider a more expensive car. Information of the Bureau of Commerce and Labor, Washington, D. C., can be had by referring to file No. 10,391.



—— ★ ——

In 10 years automobile plants in Canada have increased 4559 in number; $798,829,009 in value of capital; 175,106 in number of persons employed; $127,274,301 in earnings of salaries and wages, and $683,722,157 in value of product. Several concerns have entered the commercial field within the past year or two and the future of this branch also is promising.

—— ★ ——

P. J. Janssen of Samarang, Java, has opened an agency for R-C-H cars, made by the R-C-H Corporation, Detroit, in Holland's South Sea territory. He states that the last vestige of prejudice against American cars has disappeared, and the perfect boulevards all over the island have done much to encourage touring.

Inductance.

(1483)—In reading an electrical article I noted the word inductance. What is inductance? CURIOUS.

Peoria, Ill., Feb. 1.

Inductance is that property of an electrical circuit by which it resists a change in the current. A current flowing through a conductor produces a magnetic flux around the conductor. If the current be changed in strength or direction, the flux is also changed, producing in the conductor an electromotive force whose direction is opposed to that of the current in the conductor. This counter e. m. f. is the counter e. m. f. of inductance. It is proportional to the rate of change of current, provided that the permeability of the medium around the conductor remains constant. The unit of inductance has the symbol L. A circuit has an inductance of one henry if a uniform variation of current at the rate of one ampere a second produces a counter e. m. f. of one volt. The effect of inductance on the circuit is to cause the current to lag behind the e. m. f.

Testing Wires.

(1484)—In overhauling our four-cylinder car we had occasion to replace the primary wires, leading from the commutator to the coil, with new. They are carried in a conduit or tube and without thinking we put the wires in without marking the ends. The result was that they had to be removed and each end of each wire tagged so as to make proper connections. Is there not a simple method of testing each wire? INFORMATION.

Newton, Mass., Feb. 4.

There are several methods of locating a wire in a group as mentioned. One is to connect one end to the negative pole of a battery and lead a wire from the positive pole of the battery to the positive of an ammeter if dry cells are employed or to a voltmeter if a storage battery is utilized. By taking the free ends of the wires in the cable and connecting them one at a time to the other pole of the ammeter or voltmeter, the indicating hand of the latter will move when the proper wire is attached because the circuit is closed.

Another plan is to attach one end of any of the wires in the tube to the primary post on the coil, that terminal being utilized to make a connection with the commutator. Then take the free ends at the other extremity of the conduit member and touch one at a time to any metal part of the car. Upon the right wire being placed in contact, the vibrator will make a buzzing noise, denoting that the circuit has been closed.

Still another suggestion is to secure one lead to the zinc terminal of a battery and try the free ends of the wires at the other end of the tube upon the carbon post of the cell. A faint spark will denote when the circuit is closed. A storage battery may be employed in a similar manner.

Heating the Mixing Chamber.

(1485)—I have noticed that a large number of the 1913 cars are being fitted with tubes leading from the exhaust pipe to the vaporizer. I was told by one agent at a show that it makes for easy starting and that considerable more mileage is secured to a gallon of gasoline. Is this correct and if so why? Is it possible to fit the same thing to an old car and how could it be arranged? Who makes the tubing and is it expensive? G. E. B.

East Greenwich, R. I., Feb. 10.

The advantages of hot air in carburetion were fully discussed in the Dec. 25 issue of The Automobile Journal and the various methods of conveying heat from the exhaust pipe to the carburetor were outlined. The utilization of heated air makes for greater economy in fuel in that the more perfect the mixture the quicker it burns and the more complete is the combustion.

The device makes for easy starting to a certain extent. When the motor is cold, however, a certain number of explosions must be secured before the exhaust pipe becomes warm. After it is heated the air is drawn from its surface through the flexible tubing to the air intake of the vaporizer. In this manner it is of value after the first few explosions are obtained. It is held that greater suction is possible, because of the tubing and this should be an essential factor.

It is possible to fit the tubing and hood to any type of motor. This is indicated by the Col-Mac device, manufactured by the Breeze Carburetor Company, Newark, N. J. The hood member is fitted over the exhaust pipe and an attachment is provided for securing the tubing to the intake of the carburetor as shown in the Dec. 25th issue. The outfit is not expensive and is easily fitted as the company manufactures a variety of designs and different sizes to meet requirements. All that is necessary is to forward the model and make of car and size of carburetor.

Testing Wheel Bearings.

(1486)—In my instruction book which came with my car I noticed that it was advised to keep the ball bearings of the wheels adjusted properly. I jacked up the wheel and tightened up the bearings according to instructions, but within a short time there was more play

Digitized by Google

than before. I took off the wheels and found that some of the balls were broken and the cones badly cut. I wrote the manufacturer stating that the parts were defective. The company replied that the bearings had not been adjusted properly. I think it is up to the maker. Should like to have your opinion. SATISFACTION.

Taunton, Mass., Feb. 11.

It would be difficult for the writer to give his opinion as to whether the parts were defective without seeing them or the car. If the parts were forwarded to the maker and he stated that the fault was due to the adjustment, not to material or workmanship, his verdict should be accepted as final.

The writer has known of similar cases where the balls, cones and races were badly scored through improper adjustment and lack of lubrication. It is also possible to mistake worn spindles or bushings for lost motion in the bearings, and that the wheel may be moved easily or has

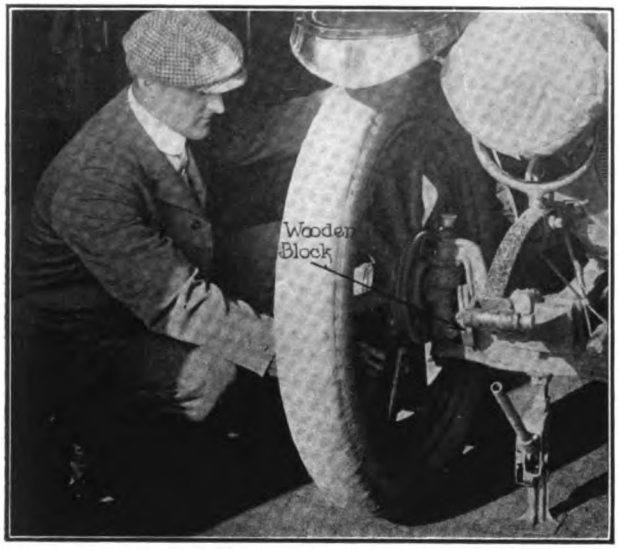

Fig. 1—Showing the Proper Method of Testing Wheel Bearings for Lost Motion.

the appearance of being loose, is not always due to the bearings.

There is a right and wrong way of testing the bearings, and at Fig. 1 is shown the proper method. The wheel should be jacked up free from the ground or floor, and a block of wood inserted between the spindle and axle as shown in the illustration. It should be driven in snugly so that there is no movement to these members.

The wheel should then be grasped as shown and if any play exists in the bearings it will be possible to move or rock it. If loose the lost motion should be removed by screwing up on the adjusting member until snug, then slack off about half a turn and lock. The wheel should be rotated slowly to note if it revolves freely without binding. Sometimes the extension of the spindle, that part on which the wheel is fitted, becomes bent through an accident such as running too close to a curb. If it is bent or out of line the wheel will revolve freely for a certain number of degrees, but bind when turned further. If these conditions exist the part must be removed and straightened by the expert. Otherwise it will be impossible to adjust the bearings.

Focal Adjustment of Electric Lamps.

(1487)—I have fitted a pair of electric lamps to my Ford car, but the light is not satisfactory; that is, it does not cover the road as well as did my acetylene lamps. What is the trouble and how can it be remedied?

ELECTRICITY.

Cincinnati, O., Feb. 17.

The trouble may be due to improper focal adjustment or the design of the lamp. It is possible that the former condition exists and it may be ascertained by changing the position of the lamp provided it is of the adjustable type.

Correct focal adjustment is very necessary for maximum service with electric headlights having parabola reflectors. In a gas lamp the position of the burner is usually fixed by the maker. With the electric units the manufacturer, as a rule, provides means for moving the bulb backward or forward.

Assuming that the point of travel is 1.5 inches; that is, from extreme rear position to the maximum front location. When the bulb is placed in the centre the geometrical focus of the paraboloid, for example, the reflected rays are parallel and a far reaching beam is produced. If the lamp be moved to the extreme rear point, the light rays will diverge and give more light to the side. When at the extreme front position the rays not only diverge, but cross in the process. The usual practise is to locate the focal length between .775 and 1.25 inches. Shorter focal lengths are prohibited because of certain mechanical requirements in the incandescent lamps utilized.

In the case mentioned it would appear that the bulb is located too far forward and by moving it back slightly it may be possible to secure the light desired. One maker suggests the following simple method of adjusting the bulbs on the road: Place a newspaper about 100 yards from the car and adjust the position of the bulbs by means of the mechanism provided for this purpose, until the best illumination is obtained on the paper. Each lamp should be adjusted separately. This is advised as the filament of the bulbs will vary slightly. The moving of the bulb about .125 inch will make a considerable difference in the diffusion of the light.

Installing Ammeter.

(1488)—In installing an electric lighting system on my machine I attempted to fit an ammeter to the dash so that I could note the action of the system. Upon trying it out I found that the ammeter did not work properly. The maker stated that it was not fitted properly as the instrument was all right and I grounded it. Is this possible? J. de B.

New York City, N. Y., Feb. 19.

If the instrument was fitted to a metal dash care should have been taken to prevent contact between the studs or metal part of the ammeter and the metal of the dash. As the latter is grounded to the frame, etc., it is obvious that it would provide one side of an electrical circuit. When attaching an ammeter to a metal dash the holes drilled in it should be bushed with fibre or some other insulating material to prevent the grounding of the instrument by the studs, etc.

Starting Cold Motor.

(1489)—Can you give me a practical suggestion for starting a cold motor? I keep my car in a small unheated garage on my premises and use the machine to go back and forth to my office in the city. Several mornings I have been very late, owing to difficulty in starting the engine. I have to remove the spark plugs to prime it and this is troublesome. Are the priming plugs advertised practical? OWNER.

Edgewood, R. I., Feb. 20.

A practical suggestion for starting a cold motor will be found elsewhere in this issue and the writer can vouch for the method, having employed it on several occasions. There are several priming plugs in the market and as far as the writer can ascertain they are practical and fulfill the function of the usual priming cock.

Soldering Aluminum.

(1490)—I have a small crack in the intake manifold of my motor and it takes in auxiliary air, causing the motor to miss at low speeds unless I set the carburetor to give a rich mixture. The manifold is of aluminum and I have been unsuccessful in attempting to solder it. I used an ordinary iron, torch and aluminum solder. What is the trouble and how may I remedy it? W. A. K.

Bridgeport, Conn., Feb. 20.

Soldering aluminum may be performed with the proper equipment. The high heat conductivity of aluminum withdraws the heat of the molten solder so rapidly that it "freezes" before it flows, a condition that creates more or less difficulty.

To solder aluminum the parts should be tinned with the iron, using a composition of aluminum and tin. Replace the ordinary soldering iron with an aluminum member. The aluminum solder may be prepared as follows: Fuse the copper, then add the aluminum in very small quantities, stirring the mixture well with a piece of iron. Next add the zinc and a little tallow or benzine at the same time. Once the zinc is added do not heat too hot and avoid the volatilization of the zinc. Take five parts of tin and one of aluminum. Solder with the iron or with the blowpipe, according to the part to be repaired.

As this will involve more or less labor, the writer suggests the use of Simplex aluminum solder manufactured by the Simplex Aluminum Solder Company, Inc., 108 Broadway, Long Island City, N. Y. The company guarantees that aluminum parts may be soldered with its solder and with an ordinary soldering iron. The maker will forward a sample of the material at the cost of a few cents, also complete instructions for its use.

Fitting Magneto to Ford.

(1491)—Is it possible to fit a true high-tension magneto to a model T Ford automobile? I have considerable trouble with the coil and have been advised to install a master vibrator. I can buy a magneto very cheap and it is in good condition. How much work would it be to install the magneto and about how much would it cost? E. L. S.

Boston, Mass., Feb. 11.

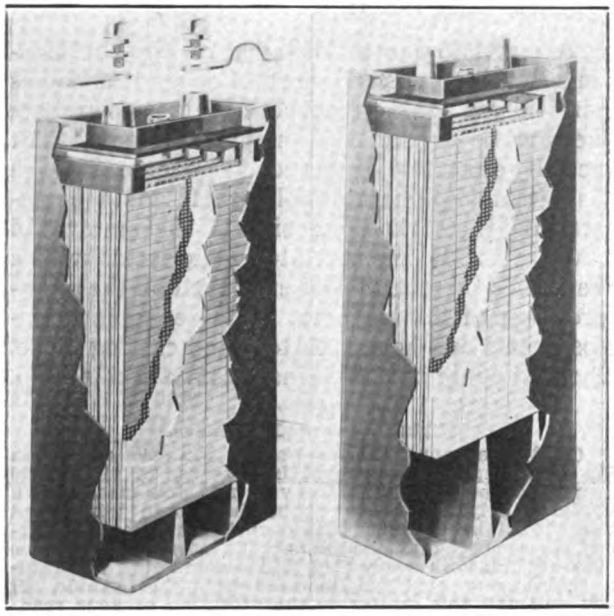
A magneto can be installed on the car mentioned and the writer knows of several machines using it for ignition purposes. It is simply a question of driving the magneto at crankshaft speed by a positive drive such as gears or through a shaft and Oldham coupling. It could be located on the right hand side of the motor and driven off the camshaft, fitting the latter with a gear twice the size of that employed on the armature shaft of the magneto. It is desirable to enclose gears and have a pattern and casting made. The cost could be ascertained from a repair shop.

Mixing Acids and Cyanides.

(1492)—In your issue for Dec. 25 you give a formula for hardening cast iron involving the use of vitriol and cyanide of potassium. If by vitriol you mean oil of vitriol or sulphuric acid it should have been pointed out that the mixing of acids with cyanides is a very dangerous proceeding, and should only be carried out in the open air and with every care to avoid inhaling the deadly hydrocyanic acid gas liberated from the cyanide. If you will call this matter to the attention of your readers, and suggest that any operations of this character, both as to the mixing of the solution and subsequent using of it, be performed in the open air, you may be the means of saving human life.

CASPER W. MILLER, M. D.

Wallingford, Penn., Feb. 10.



In the office of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos, is a big safe which is the resting place of a fortune in platinum. Each morning when the men of this particular department arrive at the factory, a supply of the mineral, which sells at about $650 a pound, is handed out to them. This they use in the manufacture of the platinum points which are a feature of the Remy magnetos. With its output of over 150,000 magnetos a year the Remy company finds use for several hundred pounds of the valuable material annually.

Digitized by Google

NEW FEATURES OF LBA STORAGE BATTERIES.

THE Willard Storage Battery Company, Cleveland, O., has been exhibiting at the recent automobile shows an improved battery cell for which extreme accessibility is claimed. One feature is a return to the use of bolted connectors, which type was originally used by battery makers and rejected because of corrosion from the electrolyte, and another is an improved form of cover which consists of a hard rubber plate and is used with a gasket of pure gum.

The custom has been for battery makers to seal the cells with a pitch or asphalt compound, heated to fluidity and poured into the top of the jars. When this cools it is necessary to cut or break it to expose the element, and in repair or

Showing Components of LBA Battery Cells:. At Left, Low Bridge Type with Bolted Connectors; at Right, High Bridge Sealed Cover Construction.

restoration the seal must be replaced and the connectors "burned," which means melting the lead, so that this will be a solid piece when cool. Corroded matter will, if permitted to accumulate, cause a short circuit or will insulate conductors, and it was to prevent this that the "burned" connectors were used. It is evident enough that time must be taken to cut the lead and to remove the sealed cover, while it is also necessary to have a tank of hydrogen gas or some other source of intense heat and the apparatus to "burn" the lead.

The condition of the battery can always be best determined by careful observation, which is not possible with the sealed type without cost for labor and perhaps material, although hydrometer readings may be made to test the electrolyte. It is maintained that with the LBA batteries the cells may be opened by the removal of the bolts and connectors and lifting the hard rubber covers and the soft rubber gaskets, minimizing time and labor and eliminating the special facilities for and the expert attention required for lead burning.

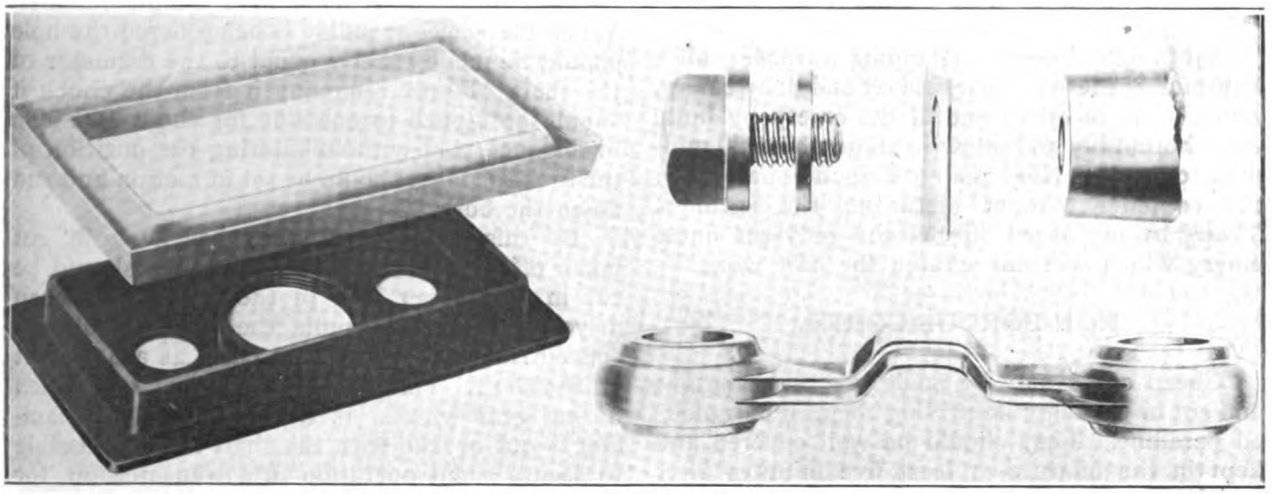
The jars are built with heavy walls to resist breakage, and with standard and extra high bridges to support the element. The latter construction affords more space for sediment to deposit in the cell. Vent plugs are made to condense the gas from charging by breaking the bubbles before they escape. The LBA plates are made by a process that insures the strength and service required for electric vehicle propulsion. Types J and K of the LBA vehicle batteries have heavy plates of standard thickness and are assembled in elements of from five to 21 plates. These types are made with the new bolted connectors and rubber gaskets, or with the old type connectors and sealed covers, and with either high or low bridge jars. Types L and M have medium plates and are assembled in elements from seven to 23 plates, the capacity of the cell being more for the same weight and bulk than with types J and K. These are also made with the low and high bridge, and it is held that the latter form will not short circuit from sediment during the life of the battery. Types N and O have light plates and the elements are composed of from seven to 27 plates. It is claimed the capacity is greater than the other and affords increased mileage.

The Willard Storage Battery Company has occupied a prominent position in the development of lighting and starting batteries. Three important features are claimed for the construction, these being: High voltage maintenance, low heat characteristics and ability to maintain the output for a considerable period. Many improvements have been incorporated during the past five years and these have been based upon the requirements of actual service.

A battery for use in connection with the lighting system on a motor car is subjected to hard service and must be designed to withstand severe treatment. For this reason all connections and supporting parts are very substantially constructed. The individual cell unit is employed on all types, permitting inspection or repair without disturbing other members. All connections are

Digitized by Google

made above the top cover of the battery, reducing the possibility of local action to a minimum.



Maximum efficiency and voltage characteristics essential for starting purposes are claimed for the battery designed for motor starting. The important factor with the electric motor starter is the torque developed by the motor. A quality emphasized in the LBA is high efficiency and low internal resistance with corresponding high voltage when discharged at a rate that will give the motor its maximum torque. The lighting and starting batteries are produced in a wide range of voltage and capacity to meet every requirement of service in pleasure cars and trucks.

AUTOMOBILES IN ALASKA.

Mail Contractor Contemplates Their Use Exclusively on White Horse-Dawson Route.

An automobile line from White Horse to Dawson, in Yukon Territory, to be operated by a new company, is probable. The White Pass and Yukon route has operated a stage line for many years during the closed season of navigation, which lasts for about eight months in the year to convey mails, passengers, express and freight between these two points. Wagons are used for a few weeks after navigation closes and also before it opens, but for the rest of the time, about six months, sleds are utilized. The distance covered is 330 miles.

During the past summer the road was greatly improved at a heavy expense to the government by cutting down grades and making it wider so any gauged vehicle could be used on it and the sleds now are the same gauge as motor cars. The grades are even and none of them is so steep that automobiles cannot climb them with heavy loads. During the past summer motor cars were used on this road from White Horse to Carmacks, half the distance to Dawson, making the trip in 10 hours. The White Pass Company receives $80,000 a year for conveying mails over its lines to Dawson, in addition to its passenger and express business. The time occupied for making the trip is five to 10 days, whereas with the new service this can be reduced materially. The new company proposes to run automobiles all the year over the route and to make the trip from White Horse to Dawson in one day during the summer and in two days during the winter season.

LBA Battery Construction: At Left, Hard Rubber Cover and Soft Rubber Gasket for Quick Sealing of Jars; at Right, Type of Cell and Bolt Connector, Affording Greater Accessibility.

In a letter from White Horse, dated Dec. 28, 1912, Harold E. Wilson tells of a trip from that place to Dawson City made by the governor of Yukon Territory and representatives of big mining interests. The journey was made in a Locomobile, made by the Locomobile Company of America, Bridgeport, Conn., and was for the purpose of demonstrating to the government that it is possible to make such a run regularly by motor car over the "winter trail." Included in the party was Assistant Manager Thomas of the Guggenheim interests in the Yukon, and George Potter, said to be the best chauffeur in Alaska. Although the trail was in bad condition the trip is reported to have been made in a satisfactory and practical manner.

Texas railroad commission has issued an order classifying motor cars as extra baggage on trains.

PREPARING EMERY FOR LAPPING.

To prepare emery for lapping purposes, fill a half-pint bottle with machine oil and flour emery, seven parts of oil to one of the emery by bulk. Mix thoroughly and allow to stand about 20 minutes to settle. Next pour off about one-half of the contents without disturbing the settlings. That portion poured off contains only the finest emery which will not scratch the best work.

NON-POROUS CORKS.

Cheap corks may be made gas and air-tight and cut or bored by immersing them in hot, melted paraffine. They should be well covered and kept in the mixture at least five minutes after which they are removed and placed upon a screen to dry.

BORING GEAR WHEELS.

While it would appear a simple matter to bore gear wheels, clutches, etc., correctly, this work may be performed improperly. Accuracy is important, especially when the parts are fitted to a shaft running at a high rate of speed. Under such conditions the bore of the gear or pulley must be slightly larger than the diameter of the shaft to which it is fitted. When hydraulic power is employed to force the wheel into position, very little difference between the bore of the part and the shaft is necessary.

Ordinarily, a pulley bored larger than the shaft is thrown out of centre when the key is driven in hard. In addition, most of the drive is taken by the key, contact between the shaft and the bush or pulley being made at a point directly opposite the feather.

This can be avoided in a simple manner. When the wheel or pulley is being bored the hole should be made exactly equal to the diameter of the shaft. Before removing it from the chuck it should be tapped to one side for about .001-inch in distance, and without altering the position of the tool, the lathe should be set in motion and run down the bore.

By this means the pulley has a slight cut taken off one side. The keyway then should be cut in the higher part of the shaft, and when driven in snugly it pulls the work absolutely concentric. In addition, the part has a better fit on the shaft. This is an important feature when boring gear wheels, as when the outside diameter is out of true with the shaft it is impossible to secure silent operation in a transmission, for example.

BLACK FINISH FOR BRASS.

An attractive black finish for brass may be secured by the following process: Dissolve in 1000 parts of ammonia water 45 parts of natural malachite. Clean thoroughly the part to be colored and immerse it in the mixture for a short period. Gradually warm the solution, examining the part from time to time to ascertain if the color be correct, then rinse and dry.

MAT ALUMINUM.

To give aluminum the appearance of mat silver, plunge the article into a hot bath composed of a 10 per cent. solution of caustic soda saturated with kitchen salt. Allow the metal to remain in the bath for 15 or 20 seconds, then wash and brush. Replace in the bath for about 30 seconds, then wash and dry in sawdust.

THE NEW LANCHESTER ANTI-VIBRATOR.

IN A RECENT issue of The Autocar, a British motoring print, F. W. Lanchester of the Lanchester Motor Car Company, Ltd., Birmingham, England, presented an interesting article concerning the Lanchester anti-vibrator, a new system of balancing a motor which is fitted to the company's product and being experimented with by several prominent British car makers. The device is also being considered by manufacturers of large engines, stationary and marine, including the Diesel. Mr. Lanchester's article is reproduced herewith.

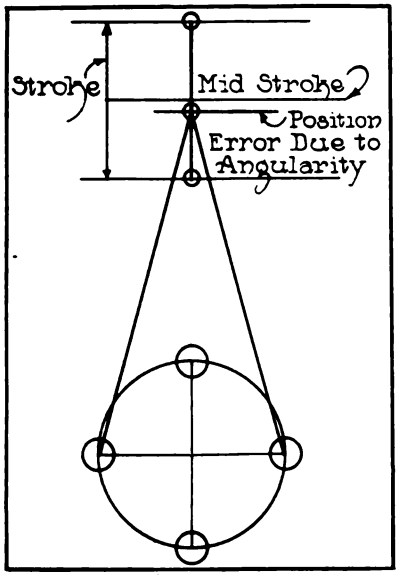

Fig. 1—Showing Error in the Position of Pistons of Four-Cylinder Motor When They Should Be at Mid-Stroke.

(By F. W. Lanchester.)

It is well known by automobile engineers and by users of four-cylinder machines, that the balance of a four-cylinder gasoline motor is far from perfect. At high speeds the vibration becomes an important factor, both as affecting the comfort of the passengers, and as prejudicial to the durability of both the chassis and the bodywork; it is, in fact, on this want of balance of the four-cylinder engine that the demand for the six-cylinder motor is mainly based. It is true that the six-cylinder motor for a given power has the advantage of more uniform torque; that is to say, for given mean torque, less extremes of maximum and minimum, but the advantage of the six-cylinder engine in this respect is a secondary matter as compared with its advantage in the matter of smooth running as dependent upon more perfect balance and freedom from vibration.

The main piston movements on a four-cylinder engine may be said to be balanced, since the pistons of the first and fourth cylinders are at their highest points when those of the second and third are at their lowest, and vice versa. If the connecting rods were of infinite length, or in practise of such length that their extreme angularity were very small, all four pistons would reach mid-stroke position at the same instant, and at all other points the number 1 and 4 pistons would by their motion accurately compensate for the second and third members. In an actual engine with a rod length of about 2.25 times the stroke, as indicated at Fig. 1, there is considerable error in the position of the pistons when they should be at mid-stroke. Thus when the crankpin is at 90 degrees from the in-centre all four pistons are somewhat below their mid-stroke position; in the case of an ordinary 20 or 25 horsepower engine (R. A. C. rating) the error of position amounts to about one quarter of an inch. This downward displacement of all four pistons, due to connecting rod angularity, takes place twice a revolution, or (regarding the main piston motions as mutually balancing each other) there is left a displacement of the whole reciprocating equivalent mass through the distance of one quarter of an inch vertically taking place twice a revolution.

Analysis shows that this displacement may be approximated to a very close degree as a harmonic motion of twice the crankshaft period, and in the new anti-vibrator a simple means has been

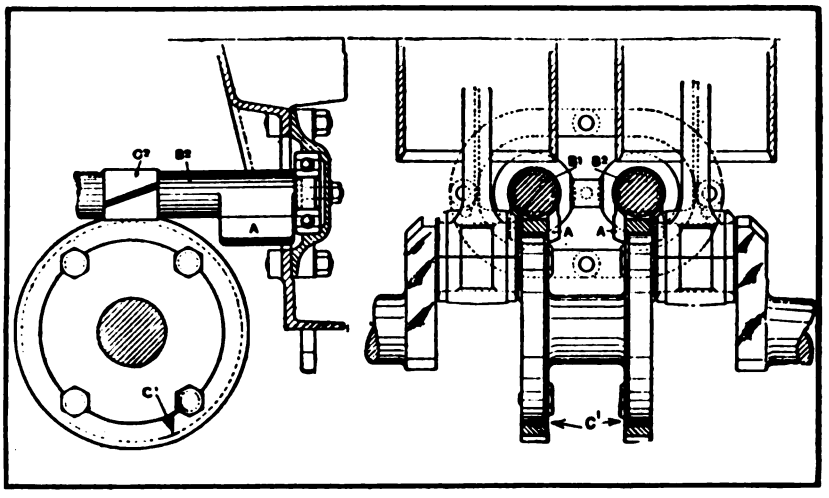

Fig. 2—Lanchester Anti-Vibrator Adopted Abroad for Securing Perfect Balance on Four-Cylinder Motors and Eliminating Vibration.

Digitized by Google

found to compensate for this source of annoyance.

The serious magnitude of this secondary vibration on existing four-cylinder engines is scarcely appreciated by many designers. It amounts on an ordinary 25 horsepower four-cylinder motor at full running speed to as much as half a ton applied alternately upwards or downwards twice a crankshaft revolution. The importance of eliminating a want of balance of this magnitude can scarcely be overstated.

On an open car the vibration due to the cause under discussion is always felt at certain critical speeds, and has heretofore been looked upon as inseparable from the four-cylinder design. Of recent years the trouble has become aggravated owing to a powerful sympathetic vibration or resonance set up in limousines, landaulets and other closed forms of body, which have today come into general use. It has become more or less difficult to meet the demand for perfect

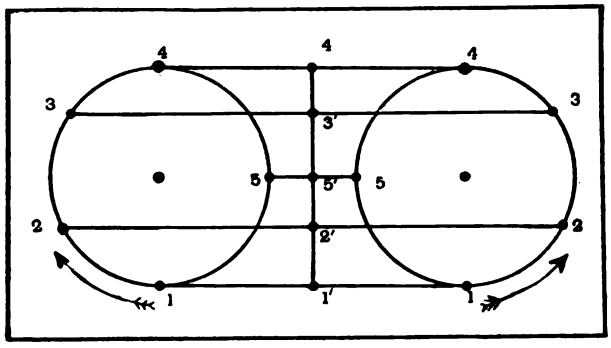

Fig. 3—Diagram Explaining Action of Lanchester Anti-Vibrator Comprising Four Rotating Balance Weights.

smoothness consequent to the high ideals created by the six-cylinder car.

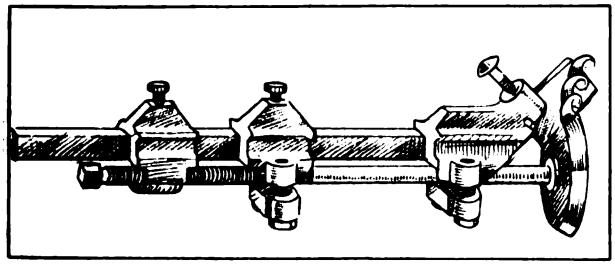
The new patented anti-vibrator acts by supplying the equivalent of a reciprocating movement equal and opposite in effect to the unbalanced component of the piston and connecting rod motion of twice the frequency of the main piston reciprocation.

The means employed will be noted by referring to Fig. 2. It will be seen that there is no actual reciprocating part, but in the place thereof four rotating balancing weights A are provided, arranged symmetrically in pairs at the extremities of spindles B 1 and B 2, driven by gears C 1 and C 2 at double the crankshaft speed. The two spindles rotate in opposite directions, and so the lateral movement of the balance weights, that is the horizontal components of their motion, neutralize one another, but the vertical motions combine to give the effect of a single reciprocation. The diagram presented at Fig. 3 depicts this action. Here the corresponding positions of the balance weights are numbered 1, 2, 3, etc., and their common centre of gravity for each numbered position is given by the figures 1^1, 2^1, 3^1, etc.

It is possible in this arrangement to correct for those irregularities of turning movement due to piston inertia; these follow the same law as to frequency as the linear secondary vibration, but in the ordinary gasoline motor the advantages in this direction have not heretofore been found sufficient to give any marked superiority to the engines corrected in this manner.

The balance weights in any case are quite small. In the arrangement shown at Fig. 2 each weight weighs about half a pound for an engine of 20 to 25 horsepower. An important point is that practically no power is utilized by the rotating spindles; the only resistance they offer to motion is frictional, and this is almost a negligible quantity. It may sound almost paradoxical to the uninitiated that a spindle rotating and doing no work can have any influence on the balance of the engine, but such is actually the case. In consequence, the gears suffer no appreciable wear, and there is no liability to noise due to backlash of the teeth, such as might be heard if employed for power transmission. It is impossible for the onlooker to tell that the motor is fitted with an anti-vibrator except from the essential fact that the noise and vibration are eliminated.

Since the announcement that the Speedwell Motor Car Company, Dayton, O., would give an option of its new rotary valve or a poppet valve motor in its 1913 Speedwell cars, orders have been received which necessitate the operation of the factory with day and night shifts. The prospects for future business make it extremely likely that this condition will exist for several months to come.



It is planned to give practical, cheap and quick transportation between Dubuque and East Dubuque, Ia., which will be equal to the best trolley service and at the rate of five cents a trip. It is proposed to purchase a 30-passenger motor car, which will run every day, starting at 6 in the morning and continuing half hourly until midnight. Special three-cent fares for working people are contemplated at certain hours of the day. It is estimated that it will cost $6000 to establish the line and it is planned to sell stock to this amount. As the route is not now covered, it seems certain that the venture might prove to be a great success.

GARAGE AND REPAIR SHOP EQUIPMENT.

NOONAN'S VALVE TURNING TOOL.

A tool for obtaining a new seat on a valve is being marketed by F. A. Baker & Co., 10 Warren

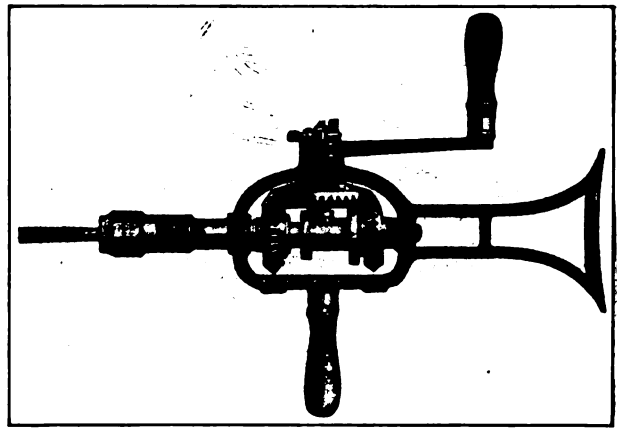
Noonan Valve Turning Tool, a Compact, Adjustable Device for Recutting Seats.

street, New York City. It is shown in an accompanying illustration, is adjustable and will take any size valve of any angle. The construction is simple and a quality of the device is that the cutters may be removed and resharpened when they become dull with service. The tool is 11 inches in length, constructed of high grade material and is highly polished. The method of fitting and recutting the valve is shown in the drawing.

AMERICAN SONOSCOPE.

Knocks and pounds about the motor are sometimes difficult to locate, especially when the noise is not very loud. The American Electric Company, State and 64th streets, Chicago, is manufacturing a device for this work called the Sonoscope and it is held that by it the most baffling click may be located easily. It operates on the principle of a telephone receiver, and owing to the construction of the part held to the ear the sounds are greatly magnified. The outfit comprises the receiver member and test rod, the latter being attached to the device when its use is desired. It is moderately priced and the maker claims that it is invaluable in the repair shop as considerable time and expense is saved in locating mysterious noises annoying to the owner.

ASHCROFT VALVE GRINDER.



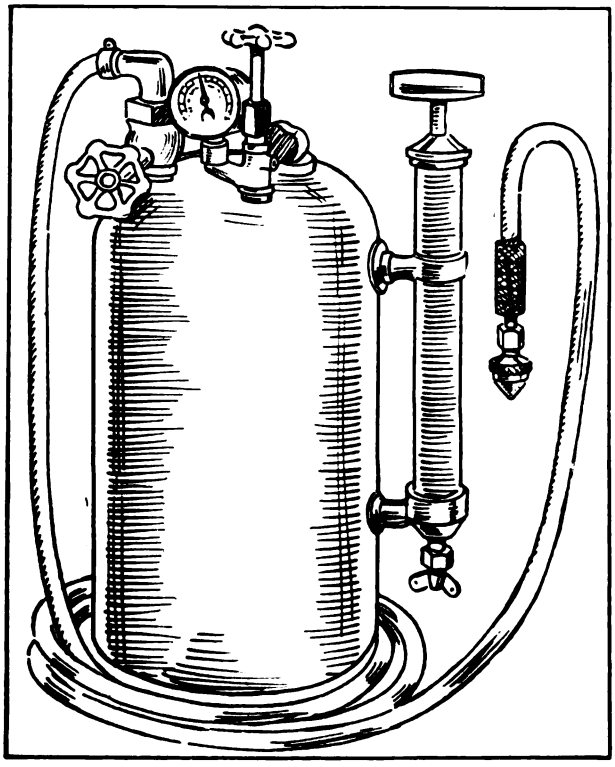
A combination valve grinder designed along the general lines of a breast drill, and so constructed that it may be utilized for a number of purposes, is the Ashcroft, made by Stevens & Co., New York City, and presented in an accompanying illustration. It is particularly adapted for grinding motor valves by hand. Its action is oscillating, with the arc of oscillation gradually advancing to the right, which prevents the cutting of grooves. Two different sized coil springs are included with each tool and these are utilized under the head of the valve when grinding for raising it as in conventional practise.

The tool may be used as a ratchet with either a left or right hand direction and for removing or replacing screws in places not easily accessible with ordinary tools. It may also be employed for drilling and tapping where a full swing of the operating crank cannot be secured with the usual drill. The Ashcroft is fitted with a chuck for either square or taper shank drills and the outfit includes a screw driver tool for rotating the valves during grinding, and a bottle of abrasive. The device is made in one size only and comes neatly packed in a serviceable box.

TURNER MOTOR WASHER.

The Turner Brass Works, Sycamore, Ill., is manufacturing a new series of motor washers actuated by pressure. They are made in three sizes holding one quart, two and five gallons respectively. One of the largest sizes is shown in an accompanying illustration.

The tanks are constructed of drawn steel, equipped with a pressure gauge registering up to 100 pounds and have large hand pumps. The design is such that the washer may be connected to a pressure tank in the garage or repair shop, suit-



Ashcroft Combination Valve Grinder Which May Be Utilized as a Ratchet Tool, Etc.

able connections being provided for incorporating in the line. Each washer is fitted with 10 feet of cloth insertion rubber hose having an adjustable nozzle.

Digitized by Google

Kerosene is utilized for cleansing and it is pointed out by the company that the same results can be obtained with this fluid as with the more expensive gasoline. The nozzle may be so adjusted that a finely divided or an intense needle stream can be secured. The fluid being forced out under high pressure all dirt or grease is easily and quickly removed from the motor or other parts of the chassis, machinery, etc. An advantage of the washer is that parts not accessible with the usual brush can be reached and thoroughly cleaned.

In addition to being utilized for cleansing with a fluid, the tank may be emptied and pumped

Turner Motor Washer, Made in Three Sizes and Employing Fluids or Dry Air for Cleaning Purposes.

full of dry air and employed for drying purposes, cleansing upholstery, etc. The washer is constructed of high grade material and is moderately priced.

FOSTNACHT VALVE RESEATER.

The National Auto Specialty Company, Tama, Ind., is marketing the Fostnacht valve reseater, a tool designed especially for reseating and polishing valves with a minimum outlay of energy. The outfit comprises a large cutter, designed to fit all sizes of 45-degree valves and five sizes of cutters, from 1.5 to 2.25 inches. The latter are constructed of a high grade carbon steel, properly tempered and have blades which may be removed and resharpened.

GOOD ROADS CONVENTION.

Plans Completed for Meeting of National Importance in Washington Next Month.

Farmers, business men and road users will be involved in what undoubtedly will be the most interesting session of the forthcoming Federal Aid Good Roads convention at Washington, D. C. At the evening meeting of March 6 the National Grange, the Chamber of Commerce of the United States, and the American Automobile Association will supply their most prominent highway advocates. Senator Jonathan Bourne, chairman of the joint committee of Congress, which is now investigating the subject of federal aid, has been invited to preside at this meeting, the conclusion of which will be in the form of an illustrated talk by Warden Thomas J. Tynan of the Colorado state penitentiary, who has accomplished much in the use of prisoners in the building of roads, with methods that embrace the honor system and absence of guards.

The National Grange spokesman will be C. S. Stetson of Maine, chairman of its executive committee, and who has studied the roads question and its relation to men and women who live in the country. It is expected that President Harry A. Wheeler will speak for the Chamber of Commerce and the interest of that organization in the development of highways, which has been inevitable, as the automobile industry, the growth of which has been a business wonder, is well represented in the chamber. Prominent examples are H. A. Meldrum, former president of the Automobile Club of Buffalo, and now president of the Buffalo chamber of commerce, and C. C. Hanch, president of the Indianapolis chamber of commerce and identified with the Nordyke & Marmon Company.

In order to boost the good roads movement and to protect automobile owners and dealers, the Sacramento Motor Car Association has been formed at Sacramento, Cal., thus taking the place of the defunct Sacramento Automobile Dealers' Association. About 40 dealers attended the organization meeting and these officers were elected: President, E. A. Meister; secretary, John McDonald; treasurer, A. Smitten.

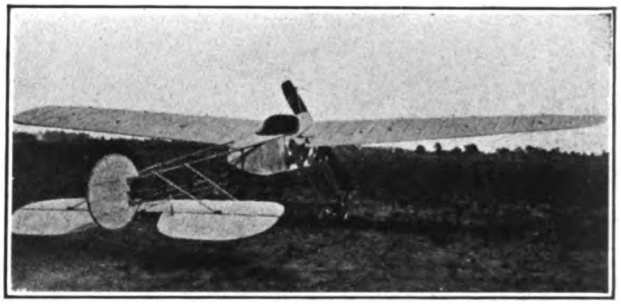
In The Aviation Field

With the Manufacturer and Operator in America and Abroad

It does not appear that the international Michelin prize for 1912 was awarded, and as a result the total this year will be $8000 instead of $4000. The conditions for the contest have been announced as follows:

The contest is for the longest flight over a measured course, consisting of two points not less than 50 kilometers (31 miles) apart. The winner must fly more than 2000 kilometers (1242 miles) at a speed greater than 31 miles an hour. At the conclusion of each round of the course the aviator must alight and sign the competitor's register. The time taken for this will not be deducted from the flying time, provided the average of 31 miles an hour is maintained. All flying must be done between sunrise and sunset, and at night the machine shall be sealed and housed in a shed. No change of machine or engine is permitted, but fuel may be replenished and repairs made if the specified average speed is maintained.



The contest appears to be arranged as one of endurance, rather than duration, as with the first Michelin competitions.

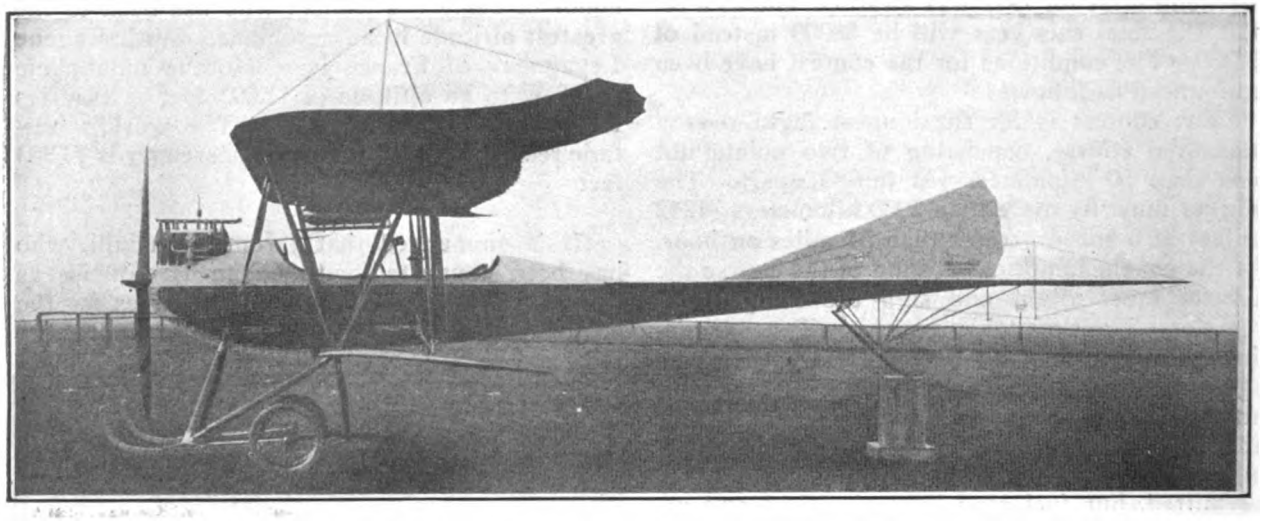
An accompanying illustration is that of the Caproni monoplane, recently presented to the King of Italy by Italians at home and in this country. It is of Italian construction throughout, and is similar in every respect to the machine flown by E. Cobiono at Somma, Italy, last March, to secure a world's speed record for 300 kilometers.

It appears also that the machine used by Slavorossof at Milan, Jan. 24, in making new world's speed records for 200 and 250 kilometers was a Caproni. Slavorossof flew 100 kilometers in 57:45; 200 in 1:56:30 and 250 in 2:24:30. Previous world's marks were held by Lieut. H. Bier at 2:03:49 for 200 kilometers and 2:39:37 for 250.

Miss Trehawke Davies of England holds the honor of being the woman who has been to the greatest altitude in an aeroplane. With Eugene Legagneux of France in a Morane monoplane she flew to an altitude of 12,093 feet at Issy les Molineaux, France, Jan. 27. The world's altitude record for a pilot and one passenger is 14,303 feet.

It is announced that Jerome Fanciulli, who has been connected with Glenn H. Curtiss as manager of the Curtiss exhibition forces for the past three years, is at the head of a new company

Caproni Monoplane of Italian Construction Recently Presented to King of Italy.



organized in Washington, D. C., for the construction of a new flying boat. Others said to be interested in the venture are: Henry R. Bond, Jr., treasurer, New London Ship & Engine Building Company, New London, Conn.; Edward C. Hammond, Boston, Mass., and P. Le Roy Harwood, a New London banker. It is stated that the factory will be located near New London on the Thames river.

Orville Wright, president of the Wright Company, Dayton, O., and one of the pioneer aviators of the world, sailed for Liverpool recently on the Mauretania. His object in going abroad at this

Digitized by Google

time was to attend the hearing before a court in Berlin in a suit brought by German manufacturers to prevent the use in that country of the Wright patents applying to the method of aeroplane control. It is contended that the subject covered by the patent was disclosed in Germany before Wright secured the right to exclusive control in that country.

The maker of the Albatross biplane in Germany has recently brought out a new model, to be known as the military type II. In this the upper plane has a larger span than the lower, and the ends are brought back to the rear at the wing tips and are warped for lateral stability. The wing tips of the lower plane are lengthened in a similar manner, so that the machine resembles the Etrich, made in Germany under Austrian license.

Albatross Military Biplane, Type II, a German Production Which Presents Interesting Features and Resembles Etrich Design.

The upper and lower main planes are not connected by vertical struts, but these are arranged diagonally so that nearly all stay wires are avoided. The under carriage is particularly strong, each strut being swathed in canvas to obviate splintering. On landing the shock is absorbed by three methods—pneumatic tired wire wheels, rubber shock absorbing rings attaching the axles to the skids, and laminated springs. The last named form a part of the attachment of the skids to the diagonal struts of the landing chassis. Two hook brakes serve to slow up the machine after alighting.

The fuselage is of the square section streamline formation, and is made to accommodate two persons, the pilot sitting behind the passenger. The sides are covered with multi-ply wood. The radiator curves downward toward the under portion of the forward end of the fuselage. The fuel tank is under the passenger's seat and benzine is employed. The engine is an Argus of 100 horsepower or a 70 horsepower Mercedes.

The empennage is composed of a triangular tail, elevator, rudder and triangular vertical fin, and this is supported by an elastic buffered skid. All control planes are large and easily detachable for quick transportation. The supporting area is 430 square feet and the weight 1056 pounds. Its carrying capacity is rated at 660 pounds.

According to Claude Grahame-White of Great Britain, France has no less than 500 aeroplanes and dirigible balloons, while Germany has between 200 and 250. These figures were presented by him in an argument for greater activity on the part of the British government. Grahame-White finds that Great Britain has but 30 machines.

In this connection it may be pointed out that Alfred W. Lawson, who has addressed an appeal to the American Congress for a larger appropriation for aeronautics, finds that Germany has a larger number of machines than France. As a matter of fact there is no agreement among estimates, since foreign governments are proceeding with the greatest secrecy in the matter of purchasing aeroplanes and dirigibles.

Mr. Lawson's figures are particularly interesting, and are decidedly conservative. He finds that government machines are owned as follows:

Aeroplanes—Germany, 310; France, 280; Russia, 120; Italy, 80; Great Britain, 50; Austria, 30; Japan, 25; Belgium, 30; Spain, 20; Bulgaria, 20;

Digitized by Google

Brazil, 18; Greece, 12; United States, six; Denmark, six; Holland, five; Turkey, five; Mexico, five; Roumania, five; Norway, four; Argentina, three; Servia, three; China, one.

Dirigibles—Germany, 22; France, 19; Russia, 10; Italy, seven; Great Britain, six; Austria, four; Japan, three; Brazil, three; Belgium, two; Spain, two; United States, one; Holland, one.

It will be seen that there is wide difference between the figures submitted by Grahame-White and Lawson with respect to Great Britain, and it may be added that still another estimate gives United States 18 machines, with provisions for 10 more before July 1. In view of the reported order of 70 aeroplanes for Austria, 20 for Chili and similar large orders for other countries, made by French constructors, it would appear that any estimate was far from correct. In any event, it will be found that America is well down in the list.

Another hydraeroplane prize has been offered by Mortimer Singer of Great Britain: The award comprises $2500 for a contest which will develop the most suitable land and water machine, the regulations to be formulated by the Royal Aero Club.

King Alphonso of Spain has at last satisfied his desire to test personally the advantages of aerial navigation. It will be remembered that when Wilbur Wright was abroad with one of the pioneer Wright biplanes, he gave several exhibitions of flying before royalty, at one of which King Alphonso was present. His majesty sat beside the aviator in the biplane for some time and at length requested Wright to take him on a short flight. The aviator declined to assume the responsibility, however.

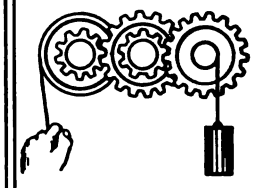
Feb. 7, King Alphonso took a half-hour's ride in the dirigible balloon Espana, during which it make a circuit of Madrid and the royal buildings. Kaiser Wilhelm of Germany is believed to be the only other reigning sovereign to have had a similar experience. About a year ago he accompanied Count Zeppelin on a short trip in one of the Zeppelin dirigibles.

Some time since E. P. Noel, editor of Aero and Hydro, offered a special prize for an hydraeroplane race, the idea being to further the development of the hydraeroplane and aero boat. Arrangements are now being made to hold this race across the Great Lakes from Chicago to Detroit, the start to be made July 12.

It is anticipated that this will prove one of the most interesting events in the aviation field in America during 1913. Each contestant will be allowed 1000 points at the start, and will be penalized one point for each minute of tardiness at each of the various controls. Five hundred points will be the penalty for failure to carry a passenger between any two points. All mechanical parts will be sealed by the contest committee.

Already five entries have been promised, three from Glenn H. Curtiss of Hammondsport, N. Y., and two from Thomas Benoist, St. Louis, Mo. Several other manufacturers in the country are eligible, and it is probable that each will be represented.

Representative Peters of Massachusetts has introduced a bill in Congress establishing a national aeronautical laboratory under the direction of the Smithsonian Institute, to carry on research and experiments to increase the safety and effectiveness of aeronautics for commerce and national defense. The foundation of such a laboratory was urged by Capt. Washington I. Chambers, U. S. N. In December President Taft named a commission to investigate the need and scope of such an institution, and in January the Senate voted an appropriation of $5000 to forward the work of the commission.



The annual international aviation show at Olympia, London, England, was held Feb. 14-22, a large number of British and Continental manufacturers being represented. The details of the several exhibits have not been received in this country as yet, but it is supposed that mechanical features of decided interest were revealed. Additional information will be presented in a later issue.

Glenn H. Curtiss has been awarded the Collier trophy for 1912 in recognition of his service to the cause of aviation in developing and demonstrating the flying boat. The trophy is awarded annually to the American doing the most during the preceding year for the advancement of practical aviation. It was presented to the Aero Club of America by Robert J. Collier, and a year ago it was awarded to Curtiss for his part in developing the hydraeroplane.

This makes five years in succession that Curtiss has been more or less officially recognized in this manner. In 1908, 1909 and 1910, he won the Scientific American trophy for actual accomplishment in flying. As a result of winning this cup three years in succession it is now held by him in perpetuity.

RECENT MOTOR VEHICLE PATENTS

Craig Tire Cooling Device.

Friction creates heat and to prevent the pneumatic tire from becoming overheated, Andrew B. Craig, Tarkio, Mo., has invented and patented a cooling device. The wheel is provided with a circumferential cooling tube of less diameter than the shoe and located within the latter, having ends spaced from each other. A short tube is connected with one end of the cooling tube and extends through the rim, communicating with the outside air. A pump actuated by an electric motor is located on the wheel, and is connected by tubing to the other end of the cooling tube. Cool, fresh air is thus circulated through the cooling member.

Haas Gasoline Strainer.

Cyrus A. Haas, St. Louis, Mo., has been granted a patent for a gasoline strainer which differs radically from the usual filter in that it is a tubular casing, internally threaded at one end and having a polygonal shaped plug with a reduced exteriorly screw threaded portion. A head is provided at the opposite end of the casing and means fitted for the attachment of the fuel line. The strainer is a sack of wire gauze, having an open contracted end and being secured within the bore of the plug, it being intended to prevent the release of foreign particles within the sack. The latter is fluted longitudinally and is expanded throughout its entire length beyond the contracted portion to the rounded end of same, and is adapted for movable contact with the inner periphery of the casing, an arrangement claimed by the inventor to permit of the insertion of the sack as well as turning of same.

Zwolinski Automobile Lock.

The large number of thefts of automobiles has been responsible for many locking devices to prevent operation of the car by others than those intended. Thaddeus Zwolinski, San Francisco, Cal., has been granted a patent for an automobile lock which is designed to secure the gear shifting lever in a neutral position and thereby prevent operating the machine under its own power. The device comprises a supporting bar which is secured to the frame of the chassis and has a suitable opening into which the lever is placed when in the neutral position. The supporting member has a U shaped hasp, having one leg hinged to the end of the bar and a locking mechanism carried by the other extremity. When not in service the locking member may be swung back out of the way.

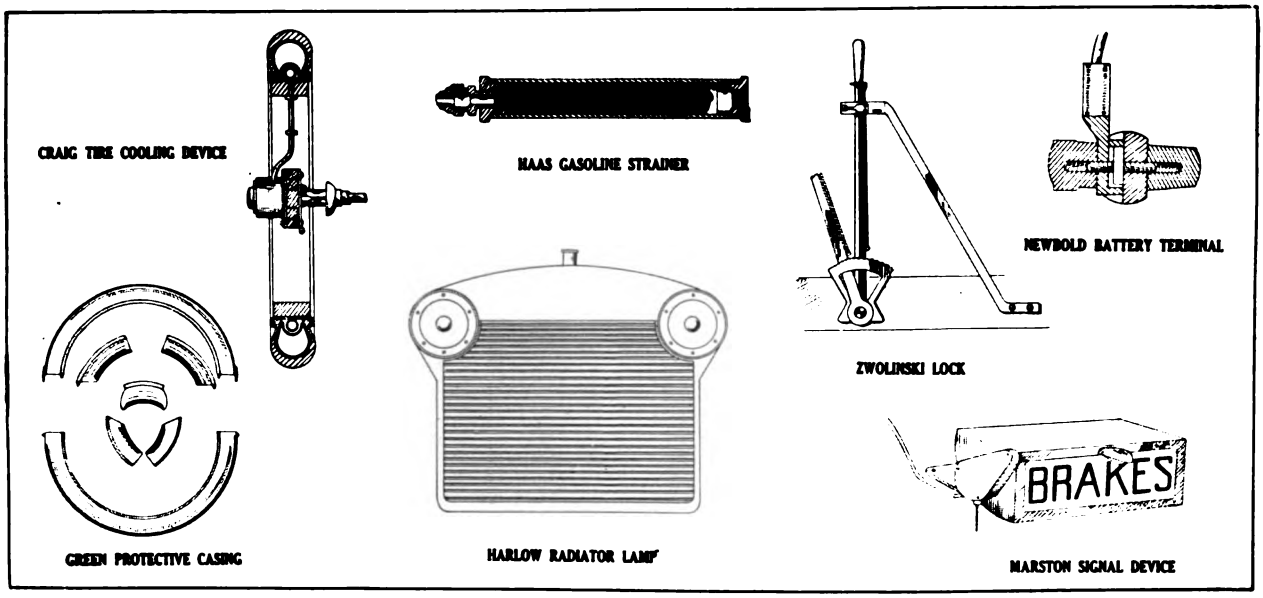
Newbold Battery Terminal.

Roger M. Newbold, Chicago, assignor to the Adams & Westlake Company of that city, has been granted a patent for a storage battery terminal. It comprises flattened posts having apertures in one of their faces, these being in the form of a channel extending through the post face, and threaded studs set through each post and passing through and beyond the aperture thereof. A pair of line terminals is provided, each with an eye for engaging one of the studs, this having a flat face for bearing against the post, while the other terminal has lateral lugs for entering the post channel and nuts engaging the studs.

Green Tire Casing.

Walter R. Green, Chicago, has been granted a patent for a protective casing for pneumatic tires. It comprises a sheet metal member conforming to the shape of the shoe and means for embracing or fitting the same. The device is made in sections, two of which overlap the air valve stem and the parts are hinged. A plurality of apertured segments are provided and so shaped as to fit into the outer tire casing. The casings are secured by a nut locking arrangement and provision is made for adjustment.

Marston Signalling Device.



Among the inventions designed to prevent rear end collisions by notifying an approaching vehicle is the Marston signalling device, patented by Charles F. Marston, Great Neck, N. Y. It is mounted at the rear of the machine and is so arranged that when the brakes are applied for stopping the word "brakes" is shown upon a casing member. Within the latter is a journalled shaft with one end extending exteriorly and having a toothed wheel which is free to rotate. A drum turns on the casing and has an integral

Digitized by Google

toothed wheel in mesh with the gear upon the shaft. The signal is mounted in the casing and is adapted to be swung by the shaft member. A flexible connection is made between the drum and the brake mechanism and operated as above described. A spiral spring is employed for returning the signal to normal position when the brakes are released. Means are provided for illumination at night by an electric lamp.

Harlow Radiator Lamp.

Don W. Harlow, Cleveland, O., has been granted a patent for a radiator lamp, the feature of which is its location in the radiator. Two are mounted in this manner and the cooler is specially constructed for the design. The lamp casing is rigidly mounted and contains the usual reflector and bulb retaining mechanism, but the glass front of the light is flush with the casing. Means are provided for adjusting the lamp.

Some Recent Patents Applicable to the Motor Car, Including Protective Tire Casing, Rear Signalling Device, Fuel Filter, Radiator Lamp, Lock and Battery Terminal.

OTHER PATENTS GONE TO ISSUE.

Tire Mail, Joseph B. Duhring, Chestnut Hill, Penn. A tire mail comprising crossed strands of chain links, the links of one strand inclosing a single loop in the adjacent link of said strand and the superimposed link of a crossing strand.

Oil Can, Ralph A. Wakefield, Sacramento, Cal. The can is similar to those of conventional construction, but carries a spring actuated pin projecting from the bottom to the top of snout. By compressing the bottom of the oiler the pin is forced away from snout opening, allowing the lubricant to flow. Normally the spring retains the head member upon its seat, closing the aperture.

Ignition System, Edwin S. Lincoln, Brookline, Mass. An ignition system comprising a generator, an induction coil, a circuit breaker having normally contacting separable contacts, and an electro-magnet for separating said contacts, a non-interruptible circuit connecting the generator with the coil through the magnet, and an interruptible circuit including said separable contacts and connected across the terminals of said coil.

Sanding Device for Cars, George F. A. McDougall, Dorchester, Mass., assignor of one-third to Christos John Scoulikas, Boston. The mudguards are utilized to carry the sand which is released by a lever member through a multiplicity of spouts, spraying the sand in front of the traction wheels. The lever is mounted convenient to the operator of the automobile.

Fastening Device for Tires, William Robert Morrison, Chicago. A tire fastening device embracing in combination with the felloe and rim an expansible and a contractible clamping ring between the wheel rim and the expansible clamping ring on each side of said wheel rim. The rings act mutually to draw a tire about the wheel, and an angled guard ring secured on each side partly covers the rings and co-operates in retaining the guard rings, which are anti-skidding members.

Valve Spring Compressor, Axel Peterson, New York City. The device is a valve spring lifter comprising a beam having a laterally projected fork at one end to engage the valve spring, while the other extremity has a pivoted rod and a lever. Moving the lever contracts and retains the valve spring as well as locks the tool.

Rubber Tire Protector, Joseph A. Utter, Crawfordsville, Ind., assignor of one-half to John F. Utter, San Francisco, Cal. It comprises an annular, trough shaped tire protector having interengaging notches in its opposite edges adjacent its ends, the bases of the notches being located in the median line of the protector.

Automobile Horn, Delroy Fifield, Cleveland, O. A horn actuated by the exhaust of the motor and comprising a tube having a partition therein and a valve disc. The latter has spring fingers embracing the partition, and is located at the mouth of the tube. A pipe is employed for conveying the gases toward the side of the disc opposite to the tube.

Fender, Charles G. Wegner, Baltimore, Md., assignor of one-third to Henry F. Sleepack and Amelia C. Wegner of the same city. It comprises a pair of parallel bars having bifurcated portions forming limbs connected to the axle and mudguards and a cross bar interconnecting the limbs, also a flexible covering.

Motor Car Headlight, Edward O. Clark, Spokane, Wash. The headlight is of the movable, swivelling type, being pivotally mounted and actuated by a rod moved by the tiebar of the car.

Inner Tube Guard, Siegfried Goodman, Bayonne, N. J. It comprises a casing of strips of textile fabric cut diagonally to the weaves thereof and having V shaped incisions formed at both edges. The latter are brought together by strap devices arranged in pairs.

TAXATION IN CONNECTICUT.

State Wants Money Now Going to Towns—Seeks to Exclude Non-Resident Truck Men.

Albert Phillips, secretary of state for Connecticut, has asked the legislature to pass a bill taking the right of assessing motor vehicles from the towns and placing it under the jurisdiction of the secretary of state. Mr. Phillips proposes to assess cars at 75 per cent. of the manufacturer's list price the first year, 55 the second, 35 the third and 20 thereafter. The rate of taxation would be 10 mills on the dollar of assessed valuation.

Inasmuch as the present very liberal non-resident provision in the Connecticut law applies to motor trucks as well as pleasure cars, Mr. Phillips has asked that that portion of the law be changed to exempt commercial vehicles for 10 days only. This is held to be directed toward concerns in other states who operate delivery service in Connecticut, and the 10 days provision would permit moving vans, etc., to enter the state without registration.

AN INTERESTING DECISION.

Opinion Handed Down by Pennsylvania Court in Action Against Truck Owner.

Automobile owners will be interested in an opinion handed down recently by Judge R. A. Kennedy in the county court at Pittsburg, Penn., in an action where damages for an alleged injury were asked from the owner of a motor truck. Judge Kennedy said in part:

It is of vital interest to the public at large that the steering gear of a heavy automobile or truck, which can wander at the will of the driver all over the highways from side to side, veering, turning and twisting in all directions and running, as they frequently do, at a high rate of speed, should be in a high, if not the highest, degree of efficiency, and if a proper inspection made before starting the machine on the streets would have revealed an obvious defect in the running gear, and such inspection was not made, or if made, the defect was overlooked, and as a result an accident occurred, the defendant cannot say that the accident was unavoidable.

The circumstances of street travel at the present time requires a much greater degree of care, both on the part of the pedestrian and the driver of the machine, than was required, 20, or even 10, years ago, and it is almost imperative on the part of the owner of a modern self-propelling vehicle that the steering gear be kept in such a condition that the machine shall go where the driver intends it to go.

It is useless to say that in this case the accident was unavoidable, because the defendant's own testimony shows that if the nut, bolt or cotter pin had been inspected that morning their worn condition would have been discovered, and they could easily have been replaced, and if, as I said before, the inspector saw them and took chances, or failed to see them, the fault is with the defendant.

This is not a case of injuries arising from defective machinery in a mill or upon private property, but an accident happening on a public highway, where life and limb are every moment in peril of machines which dart hither and thither, their direction and speed controlled solely by machinery under the control of the operator, and if accidents can be averted by the proper care and inspection on the part of the owner or driver of the machine, it is but due the travelling public that such care be taken and inspection made.

ORGANIZE TO FIGHT BILL.

Massachusetts Truck Interests Take Decisive Action Against Weight Limitation.

Representatives of the motor truck and kindred industries, including users of mechanical transports, in Massachusetts, met in Boston early in the month to take decisive action on the bill now pending for the limitation of the weight of vehicles using the highways. It is generally conceded that the bill, which has the approval of the Massachusetts Highway Commission, is aimed at motor vehicles, the reason for the proposed legislation being that heavily loaded trucks damage bridges throughout the commonwealth.

The following committee was appointed to take up the fight in earnest: J. S. Hathaway, James T. Sullivan, J. B. Sullivan, Jr., James Fortesque, William H. Bain, John H. Duffell and

Digitized by Google

J. Porter Russell. This committee already has been in conference with the highway commission in an effort to secure the defeat of the bill.

TO CHANGE REGISTRATION FEES.

New Hampshire Legislature Asked to Adopt New Figures and Prohibit Certain Horns.

Representative Shepard of Boscawen has introduced a bill in the New Hampshire legislature providing new registration fees for automobiles as follows: Pleasure cars of 16 horsepower and under, $5; 16-25, $10; 25-30, $15; 30-40, $20; 40-50, $30; 50-60, $40; over 60, $50; commercial vehicles of one-ton capacity and under, $10; one to 1.5 tons, $15; over 1.5 tons, $20. Apparently motorcycles are not included in the bill.

The present law provides for the following fees: Pleasure cars of 15 horsepower and less, $10; 15-30, $15; 30-40, $20; 40-50, $25; 50-60, $30; over 60, $40; all commercial vehicles, $10; all motorcycles, $3.

Representative Langdell of Milford presents an amendment to the existing law, which reads as follows:

The driver of any motor vehicle shall not operate the same within the thickly settled part of any city or town within the meaning of section 1 of said chapter 133, with the muffler open, and neither shall he, within said territory, signal by a whistle or device other than a horn attached to a rubber bulb or similar signal.

TO LICENSE OPERATORS.

Rhode Island Legislature Asked to Enact Bill Requiring Registration of Owners.

Representative Hammill of Bristol has introduced a bill in the Rhode Island legislature which provides for the registration of all operators of motor cars, whether chauffeurs or otherwise. It is understood that this bill was prepared by the Rhode Island Chauffeurs' Association. It amends the present law and reads as follows:

Sec. 7. No person shall operate a motor vehicle upon the public highways of this state until he shall have first obtained a license for that purpose, but nothing herein contained shall prevent the operating of a motor vehicle by an unlicensed person other than a person whose application has been refused, or whose license has been suspended or revoked, if accompanied by a licensed operator, which licensed operator shall also be personally liable for any violation of the provision of secs. 11, 12 and 13 of this chapter. All licenses for operating motor vehicles shall be issued by the state board of public roads.

Licenses issued under the provisions of this chapter shall be of two kinds. Licenses of the first kind shall be issued to persons operating or intending to operate motor vehicles for hire, or compensation, hereinafter referred to as chauffeurs. Licenses of the second kind shall be issued to persons other than chauffeurs or those intending to operate motor vehicles for hire or compensation.

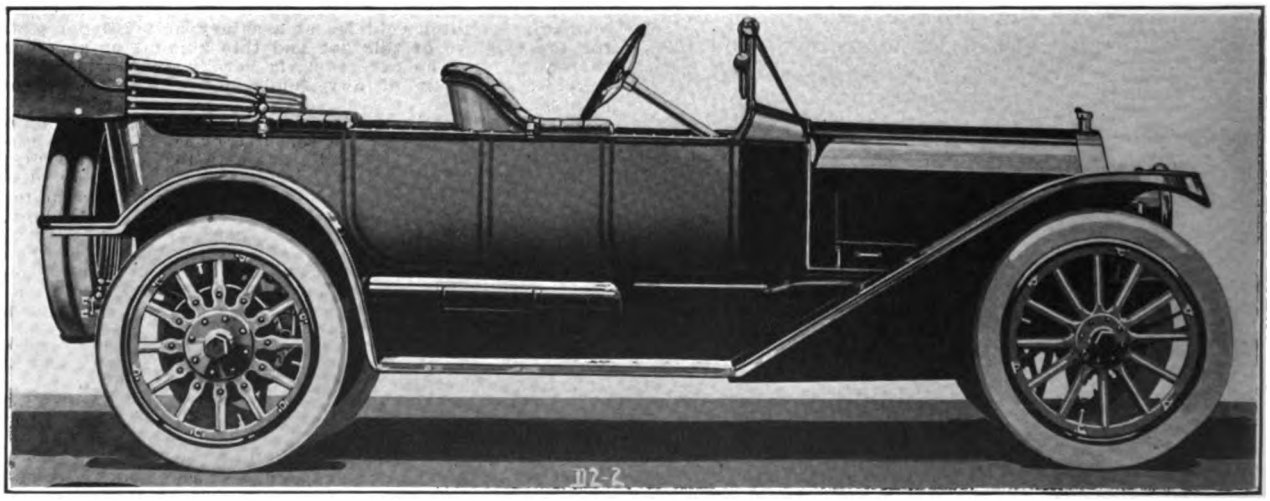
No license of the first kind shall be issued to any person under the age of 20 years or to any person who has not driven a motor vehicle at least 500 miles accompanied by an instructor or licensed driver. Any applicant for a license of the first kind shall be required by said board to show such knowledge of the mechanism of motor vehicles, the rules of the road, and the motor vehicle law, as will, in the opinion of said board, render said applicant a proper and safe person to operate said vehicle upon a public highway; and the applicant shall further demonstrate his ability to operate the said vehicle by a road test under the supervision of a qualified expert appointed by said board.

No license of the second kind shall be issued to any person under the age of 16 years. Any applicant for a license of the second kind shall be required by said board to show such knowledge of the mechanism of motor vehicles, of the rules of the road and the motor vehicle law, as will, in the opinion of said board, render said applicant a proper and safe person to operate said vehicle upon a public highway.

The state board of public roads is hereby authorized and empowered to purchase, for the purposes of this statute, a motor vehicle which shall not exceed in cost $2500, and this amount or so much thereof as may be necessary, is hereby appropriated for that purpose, out of funds not otherwise appropriated. The state board of public roads is hereby authorized to employ an expert operator of motor vehicles at a salary of $1800 per year for the purpose of this act and this amount or so much thereof as may be necessary, is hereby appropriated for that purpose, out of any funds not otherwise appropriated.

No person shall operate a motor vehicle upon the public highways of this state for hire or compensation unless he holds a chauffeur's license or a license of the first kind. The state board of public roads, may, in its discretion, refuse to grant a license for operating a motor vehicle upon the public highways to any applicant whom, for any reason, it considers an improper person. Application for license shall be made under oath upon blanks furnished by said board and said application blanks and said licenses shall be in such form and contain such provisions, not inconsistent with this chapter, as said board may determine. A number shall be assigned to each licensee and a proper record of all applications for licenses and of all licenses issued, shall be kept by said board at its office, and shall be open to public inspection. Each license shall state the name, place of residence and postoffice address of the licensee and the number assigned to him.

Said licenses shall continue in force one year from the date of issue, unless suspended or revoked for cause. And shall, at all times, be carried by the licensee when he is operating a motor vehicle upon the highways of this state and shall be subject to examination upon demand by any proper officer; and said licenses shall have indorsed thereon in the proper handwriting of the licensee, the name of said licensee, and when requested by a proper officer, in the discharge of his duties, under this chapter, said licensee shall write his name in the presence of said officer, to the end that the identity of said licensee may be determined.



Must Be Labelled as Naphtha—If the bill introduced in the Michigan legislature by Representative Wolcott becomes a law, all motor fuel below 60 degrees test offered for sale in that commonwealth must be labelled as naphtha. The increased cost of gasoline is given as the reason.

Taking Car Without Permission—The House of Representatives in Missouri has passed the bill making it a misdemeanor, subject to a fine or jail sentence, or both, to use an automobile without the owner's permission. In case the offender is a chauffeur his license shall be revoked and cannot be renewed for two years.

TWO CHASSIS REPRESENT HAVERS LINE.

TWO chassis, these being known as the Havers Six 55 series D and Six 44 series C, comprise the 1913 product of the Havers Motor Car Company, Port Huron, Mich. To each chassis is fitted a touring and roadster type of body. The same general specifications will apply to each machine and the same type of motor is employed, differing only in the bore and stroke. All models are completely equipped, the series D having an electric lighting and motor starting system, while the series C is fitted with an acetylene starter, the electrical equipment being listed as extra. The changes made over the 1912 designs are mostly in the nature of refinements and the same high grade material and workmanship noticeable of previous models are incorporated in the new product.

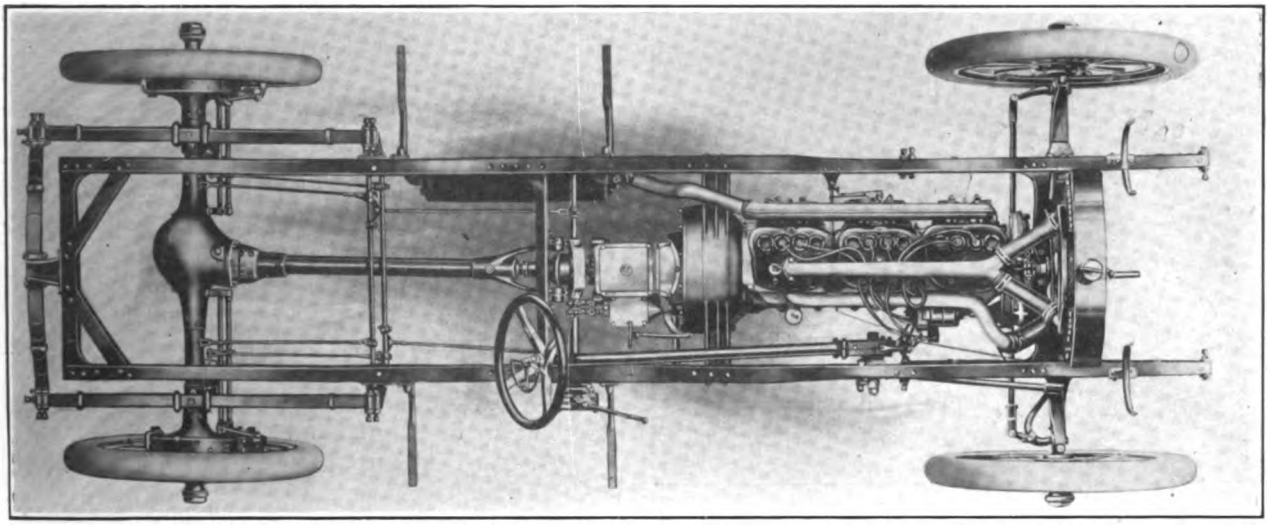
Havers Six 55 Series D Touring Car Having Ample Power to Meet All Requirements of Service and Being Completely Equipped.

The motor is of the L head type with cylinders cast in pairs. The bore of the series D is 3.75 inches and stroke five, while the smaller engine has a four-inch bore and stroke of five. The horsepower is rated by the company as 55 and 44 respectively. The water jackets are cast integral and the spaces through which the cooled fluid circulates are .75 inch diameter. This with large sized water manifolds and ample capacity cellular type of radiator provides proper cooling under all conditions of service. Cooling is further aided by a belt driven, adjustable fan.

The crankshaft is of ample diameter and rotates in four large bearings, the centre members being three inches long, that at the flywheel end four and the front 3.5. The connecting rods are large and their big ends have 2.625-inch bearings. The carburetor is a Stromberg. A Bosch dual system magneto is employed for ignition on the series C, the ignition, lighting and motor starter being a combined unit on the larger motor.

Lubrication is by a combination system of force feed and splash. The oil is pumped from a sump cast integral with the lower half of the crankcase through a distributing channel in the upper half to the main bearings and gears. The overflow collects in troughs into which the ends of the connecting rods dip, splashing the oil to the pistons, cylinder walls, etc.

The clutch is a multiple disc, steel plates, Raybestos lined, and easy engagement is emphasized in the construction. The transmission is of the selective type, providing three speeds forward and reverse, and all gears are of chrome vanadium steel, wide faced and of large diameter. They are heat treated and hardened and so designed as to give quiet operation. The main and layshaft are ample in size and rotate on large annular ball bearings. One of the qualities claimed for the Havers transmission is easy changing of speeds.



Drive is by a propellor shaft of a high grade steel carried in a torsion tube with a full universal joint and slip joint on the transmission shaft. The driving strain on the rear axle is carried through radius rods while torsional stresses are compensated for through the frame by a large yoke carried on a substantial cross member.

The rear axle is of the full floating type with

Digitized by Google

1.5-inch nickel steel axles and the wheels are secured by a flange construction which may be removed easily when the shafts are withdrawn. The differential, driving pinion and bevel gear are accessible through a large inspection cover at the rear of the differential housing and means are provided for replenishing the supply of lubricant. The front axle is of the conventional I beam section type, a drop forging with forged yokes and spindles 1.5 inches in diameter. The construction makes for a large factor of safety and has ample overload capacity.

Semi-elliptic springs are employed in front, these being 40 inches long and two wide. The rear members are three-quarter platform, 46 inches long, two wide and the rear cross member is 36 inches long and two wide. All bolts or parts subject to friction are provided with grease cups.

Plan View of Havers Six Chassis Depicting Suspension of Power Plant and Accessibility of Components.

The frame is a heavy channel section of pressed steel, .1875 inch thick and is 31.5 inches wide at the rear where the usual kick-up is provided, making for a low centre of gravity. It is in-swept at the front, making easy turning of the car in narrow streets. The cross members are securely anchored.

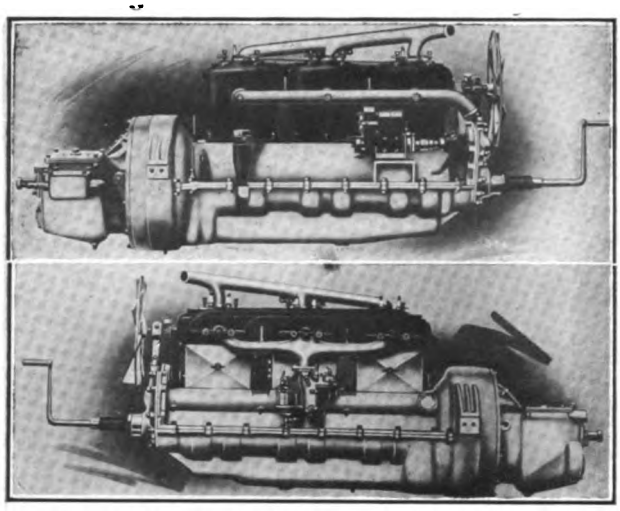
Two sets of brakes are provided, the service being actuated by pedal and of the external contracting type. The emergency is of the internal expanding design operated by the conventional hand lever. Both sets are fitted with equalizers and liberal braking surface is secured through the large sized drums, which are 14 inches in diameter and have two-inch faces.

The wheels are of the artillery type, having 12 heavy spokes, and the hubs are substantial. Baker or Firestone quick detachable demountable rims are offered, with one extra member as standard equipment. Thirty-six by four-inch tires are fitted to both chassis. The wheelbase of the series D is 128 inches; that of the smaller machine 122. Tread is standard, 56 inches.

The driver is placed at the right on all models with quadrant containing gear shift lever and emergency brakes secured to the frame, but inside the body. The service brake pedal is located at the right of the steering column with clutch pedal at the left. The usual accelerator pedal is included.

The steering gear is of unusually sturdy construction, a worm and full wheel irreversible type being utilized. Provision is made for adjustment. The steering column is set at a comfortable angle and the spark and throttle controls are mounted on top of the column. The fuel capacity is 18 gallons on the series C and 20 on the larger vehicle, and with both feed is by gravity to the carburetor. The oil capacity of each motor is 1.75 gallons.

Ample room is provided in the touring models, especially in the tonneau. The rear seat of the series D has a width of 53 inches, and depth of 19. The upholstery is deep and luxurious, the finest grade of curled hair and leather being employed over comfortable springs.



The bodies are of the latest straight line fore door type of attractive design with cowl dash, and when electrical lamps are fitted the side members are of the flush type in the dash. The fenders are well designed and substantially constructed and the passengers are protected from mud and water by splash aprons. The company calls particular attention to the finish of

Digitized by Google

its cars, stating that considerable pains is taken in the painting, which is not only high grade, but very durable.

The equipment is very complete, including Havers mohair top with patented inside curtains and automatic ventilating windshield. The horn is located under the hood and the lamps employed are Gray & Davis, finished in black enamel and nickel. In addition to the above equipment there are provided a speedometer with grade indicator, robe and coat rail, tire irons, full set of tools, tire repair outfit, pump, jack and one extra demountable rim.

The Havers Six 55 Knickerbocker speedster is designed to afford a car of high speed possibilities and the maker claims that it is capable of attaining 72 miles an hour, as well as being throttled down to three miles an hour on the direct drive. It is noticeable for its racy appearance and low centre of gravity. A combination fuel and oil tank of ample capacity is mounted in the rear of the seats. Provision is made for carrying supplies, a large trunk being fitted to the deck while an ample sized tool box is mounted on the running board. The tire irons at the rear permit of the carrying of two extra rims.

Intake and Exhaust Sides of Havers Motor Showing Compact Construction and Method of Enclosing Valves.

NEW BOOK OF STANDARDS.

National Tube Company Presents Its 1913 Edition, Which Is Replete with Information.

The National Tube Company, Pittsburg, Penn., manufacturer of tubular goods, is publishing its 1913 edition book of standards containing 559 pages of information and engineering data upon tubing. Several pages are devoted to covering the main process of manufacturing both welded and seamless tubes, also threading, durability and physical properties of both National and Shelby seamless steel tubes. Those specialties of the last named design are described and illustrated and considerable space is given to tables dealing with this material.

The book is unusually replete with tables giving weights, dimensions, strengths, pressures, etc. Considerable attention is given to the mechanical properties of solid and tubular beams, notably those utilized in the motor car industry. Information in regard to water, gas and air is included, as well as tables of measures, etc. A glossary of terms used in the pipe and fitting trade is located in the back of the book. It is very compact, being four by 6.5 inches, printed on Canterbury Bible paper and retails for $2 the copy.

CADILLAC LIGHTS HOUSE.

Massachusetts Finds New Use for Storage Battery of Lighting and Starting System.

Owners of country homes not provided with means of gas or electric lighting may profit by the example of H. J. Murch of Worcester, Mass., who solved the problem in a unique way. Mr. Murch owns a Cadillac car, made by the Cadillac Motor Car Company, Detroit, and has adopted with much success the plan of illuminating his home by means of current drawn from the storage battery of his machine.

Mr. Murch's cottage is at Northboro, Mass., and he wired the house for electric lights and led the feed wires to the garage. There, by the insertion of a plug, connection is established between the automobile and the house and he has light. During his day's driving the electric system, which furnishes power for starting, ignition and lighting, is storing electricity in the battery. At night the current thus generated is sufficient for running five 16 candlepower electric lamps in the house.

At a recent meeting of the contest board of the A. A. A., Teddy Tetzlaff, who was disqualified for driving at an unsanctioned race meeting in California, was reinstated, such reinstatement to take effect May 28, 1913. This news is of importance to the motor racing world as it is expected that Tetzlaff will be one of the leaders in the 500-mile sweepstakes to be held May 30 at Indianapolis, Ind., although announcement of his entry has not been made as yet.

FEATURES OF THE 1913 MOTORCYCLE.

Machines Equipped with Motors of Higher Power—Increase in Chain Models---Magneto Ignition Almost Exclusively---Motor Starter Makes Appearance.

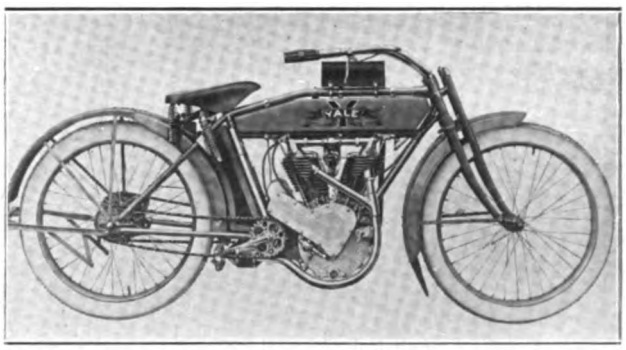
CAREFUL study of the motorcycle situation at the beginning of the 1913 season indicates that while there are few changes which may be regarded as at all radical in their nature, the de-

Ten Horsepower Emblem Twin.

signers have been exceedingly busy during the past year. The list shows a total of 31 makes, as against 25 for 1912, but the names of six manufacturers are not continued in this year's specifications, suggesting a total gain of 12. Some of these are new firms, who are only just placing their product in the market.

Perhaps the most interesting innovation of the year is the motor starter, and as yet it is represented on but two models and those both of the same make. The two-cycle motor made its appearance a year ago, and is continued this year, with a second model of the same name. Then there is the miniature automobile, with its steering wheel, which made its initial announcement during the summer of 1912 and takes its place in the annual specification sheet for the first time.

In most other respects the 1913 product follows conventional, standardized lines, but with numerous changes as applied to the individual mounts. Last year, for instance, eight of the makers were producing machines with automatic inlet valves, while this year the list has been reduced to three. The mechanical valve, of which the overhead rocker type is the most popular, has gained decidedly, and with many of these the inlet is placed over the exhaust.



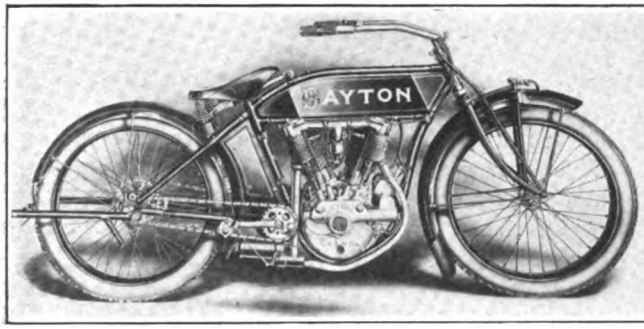
There also is evidenced a strong tendency toward greater horsepower. In 1912 there were 48 singles out of a total of 67 models, while this year there are 41 out of a possible 76. Of the 48, 30 were fitted with motors rated at four horsepower and 13 with five horsepower units. The figures for 1913 show 16 four horsepower machines and 21 of five horsepower.

Of the 16 twins in 1912, 11 were fitted with engines rated at seven horsepower, and the highest rating any producer cared to make was eight horsepower. This year there are 31 twins, and 17 of them are rated at seven horsepower, while there are three eight horspower machines—not counting those which are listed as 7-8 horsepower —six of nine and five of 10. One of the sevens is listed as 7-10, and one of the tens as 10-13.

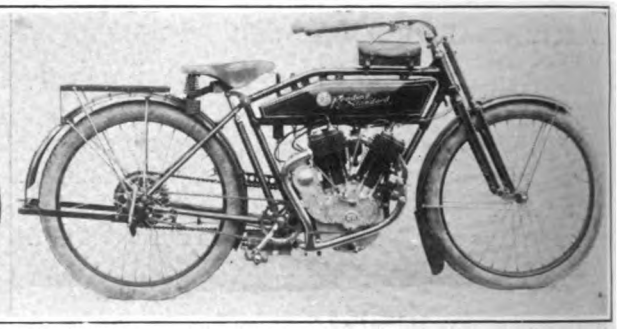
But one battery model is listed as against nine in 1912. Several makers are furnishing independent spark control levers. The magnetos are largely of the armored water proof type.

In the matter of transmissions, there were 41 belt driven models in 1912, 21 chain, five with option of chain or belt and two shaft. This year there are 40 using the chain, 18 with option of chain or belt, 13 with belt and five shaft driven models.

Clutches are fitted almost exclusively and several two-speed machines have been added to the list. There is a decided increase in spring forks, and a very evident desire to consider the comfort of the rider in every respect. It also should be borne in mind that the forks have been widened to permit of larger tire sizes, which in most cases may be at least .25-inch larger than those listed as regular equipment. Provision also is made



7-8 Horsepower Yale Twin.



for the use of tire chains if desired. The newly adopted standard rims are universally fitted, and in almost every instance the rear wheel is 28 inches in diameter.

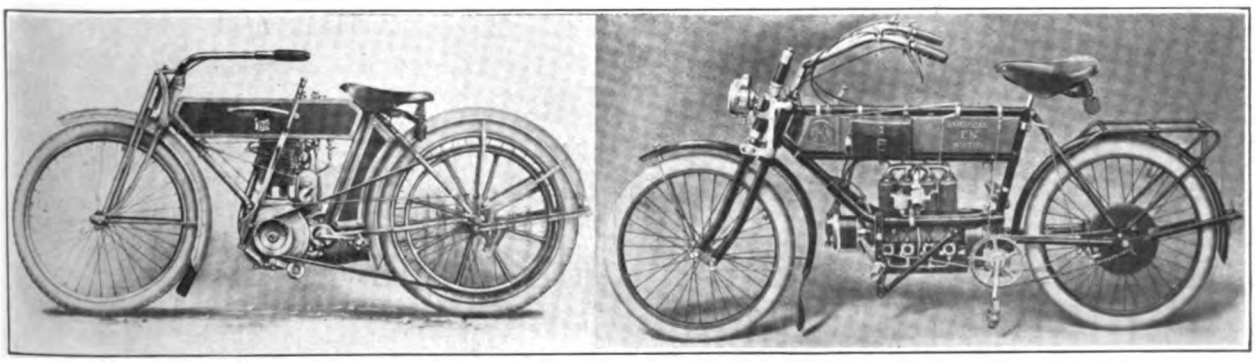
BOSCH AT THE SHOW.



The Bosch Magneto Company, New York City, is particularly pleased with the showing made by its product at the first independent motorcycle show in Chicago. According to its figures 80 per cent. of the 77 machines on display were fitted with Bosch magnetos. The tabulated score submitted by the company is as follows:

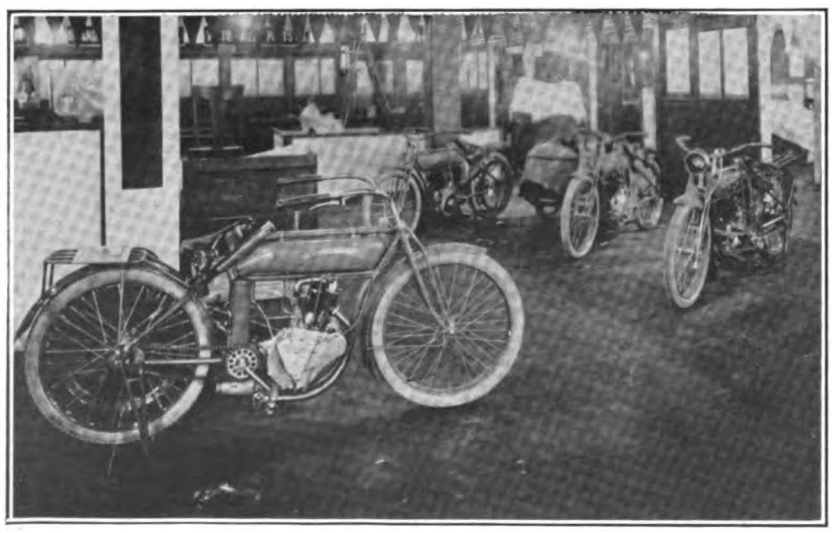
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

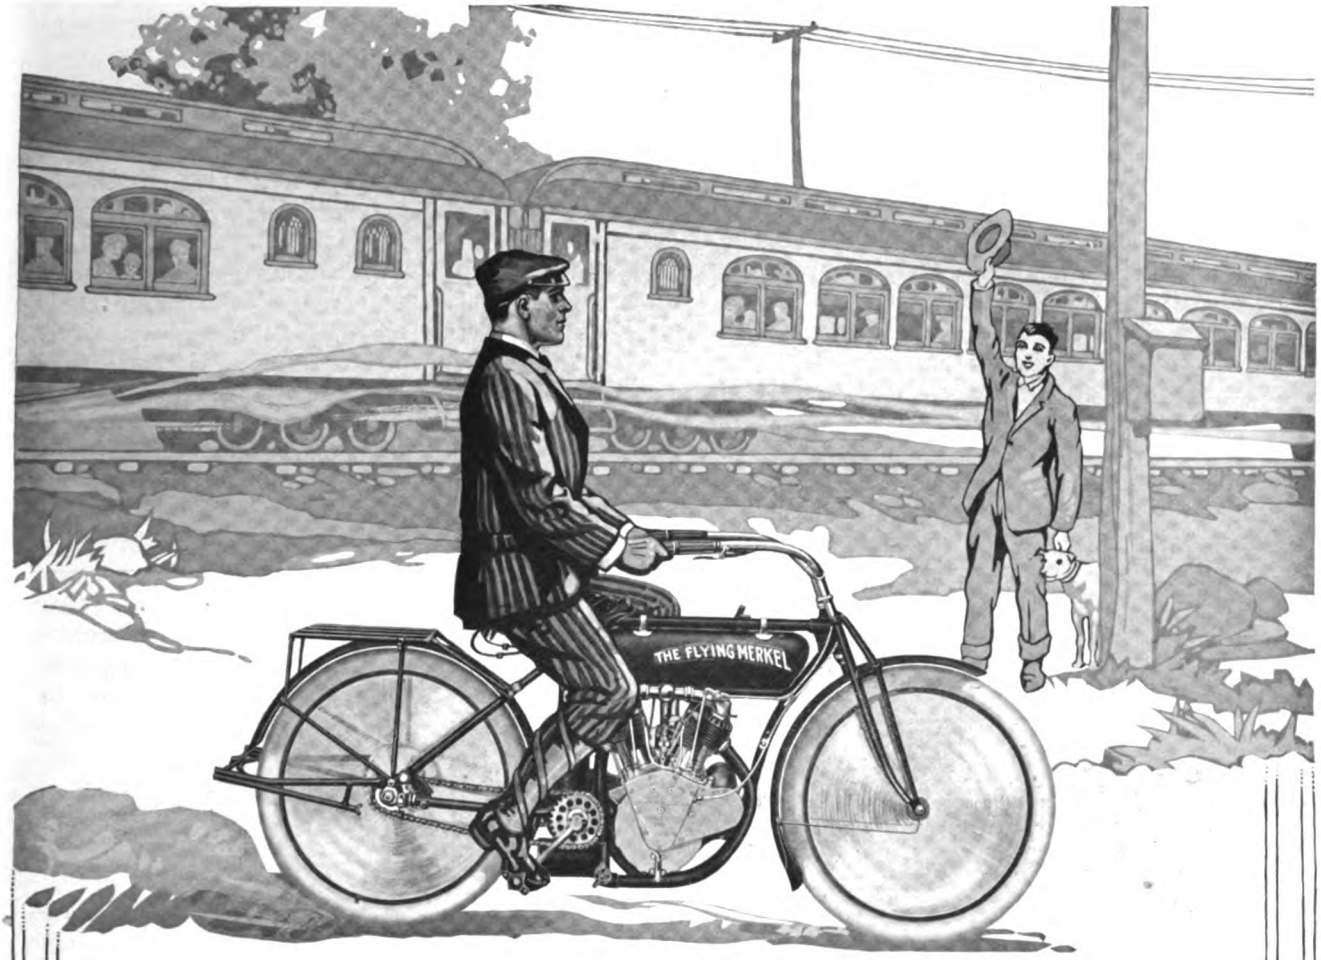


National Motorcycle Show.

The experiment of the Motorcycle Manufacturers' Association in holding an exclusive national show in Chicago appears to have been successful from every viewpoint. It is considered by the makers and others in the industry as marking a new epoch in the history of the two-wheeled mount. Heretofore, these vehicles have been displayed in connection with the big automobile shows in New York, Chicago and Boston, and there has been a feeling for some time, by manufacturers, dealers and riders, that insufficient opportunity was afforded in this manner to call direct attention to the merits of the product.

With the inauguration of the separate show, there comes a suggestion that the business of producing motorcycles has reached a point where it must be regarded in a new light. The success of the enterprise indicates that the industry has developed sufficient proportions to warrant consideration of its separate identity. The exhibition was most complete in this respect, accessories, supplies and fittings applicable to the motorcycle forming no small portion of the display.

Just previous to the opening of the show a movement was set on foot looking toward but one annual display, this to be held in Chicago. While it is true that two-thirds of the makers are at present located in the Middle West, it must be remembered that those with factories in the East are decidedly important factors in the motorcycle industry. Some of these latter have made it plain that the eastern market must be considered as well as that which has its centre in and about Chicago. The entire question will be taken up at an early meeting of the associa- torcycle also forming a decidedly important section of the display.



Headquarters of Flying Merkel During Recent Chicago Show.

Merkel Starter Proves Point.

During the closing hours of the Chicago show an amusing incident took place at the Flying Merkel booth. Advertising Manager F. L. Valiant was trying to convince a doubting Thomas that the motor starter on the new Yellow Jacket model was all that the company claimed for it, when someone accidentally touched the small lever which sets the starter in motion. It so happened that a little gasoline had been left in the carburetor, and the machine started with a roar, which took the doubting Thomas completely by surprise.

Mr. Valiant claims that the Yellow Jacket models will do more to promote the use of the sidecar in this country than any other one agency. He calls attention to the fact that when it is necessary to lift the motorcycle onto the stand the sidecar is thrown out of line with the rear axle. With the motor starter no stand is necessary and the rear wheel of the machine may

but inadequately expresses the superior and exclusive features embodied in the motorcycle which has created a sensation wherever motor vehicles are known.

THE FLYING MERKEL

for 1913 is the only motorcycle in the world with a Self-Starter and Two-Speed Free Engine Hub —an exclusive feature which at once makes motorcycling more than ever a sport for gentlemen. The original and improved Spring Frame and Spring Fork makes all roads boulevards, and the full Hess-Bright ball-bearing motor gives the power plant flexibility not found in any other motorcycle engine. Write for art catalog fully describing the famous prize winner "4-45" and "7-75" "Yellow Jacket" models.

rest upon the ground at all times, keeping its alignment with the wheel of the sidecar.

California Clubs Remain Loyal.

Several of the motorcycle clubs in California are opposed to joining the new Western Federation, preferring to remain with the F. A. M. One of these is the San Jose Motorcycle Club and Mr. Banta, a prominent member of the club, states as one reason that the F. A. M. will soon be able to give sick and injured benefits to its members, which the new organization will be unable to do for many years to come.

A Million Motorcycle Plugs.

The wonderful growth of the motorcycle industry since the first crude affair with a small gasoline engine mounted on the front forks and propelling the machine by a friction pulley, is shown in the statement that one American firm will manufacture 1,000,000 spark plugs this year for motorcycle use alone. The Splitdorf Electrical Company, Newark, N. J., which recently was merged in a $3,000,000 combination, was the pioneer American producer of ignition apparatus. The far-sighted business policy of the Torrington Company, Torrington, Conn., in acquiring this veteran house appears to have been proven conclusively when it is known that it already has produced so far this year over 100,000 magnetos.

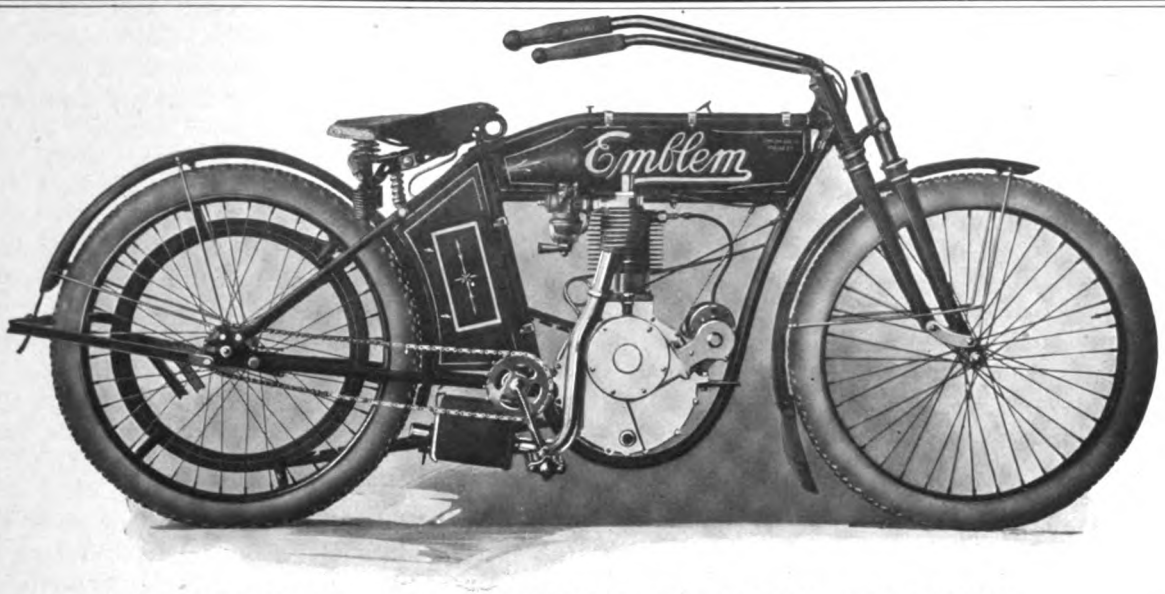
Where the Emblem Mounts Were Exhibited at the Chicago Display.

New F. A. M. Commissioners.

The following F. A. M. county commissioners have been appointed by the state commissioner for Indiana: Allen county, C. F. Schory, 1110 Broadway, Ft. Wayne; Cass, Edward W. Arnold, 211 Sixth street, Logansport; Clay, Otis E. Allen, Brazil; Dearborn, Emmanuel V. Oberting, Lawrenceburg; Decatur, Earl Rogers, 128 West Main street, Greensburg; Fulton, C. M. Studebaker, Twelve Mile; Grant, G. Carlton Harwood, 217 East Fourth street, Marion; Hamilton, P. E. Ummel, Noblesville; Knox, J. F. Borrowman, Vincennes; Kosciusko, Burcke C. Cooke, 120 West Market street, Warsaw; Madison, George Reisinger, 12 West 10th street, Anderson; Marion, David Baumann and Ray Hofstatter, 334 North Illinois street, Indianapolis; Marshall, Vern Warner, Argos; Miami, John J. Miller, 19 East Main street, Peru; Montgomery, Grant Gould, Crawfordsville; Randolph, Thurman Constable, Union City.

Club Notes, Here and There.

The annual election of officers of the Providence Motorcycle Club, Providence, R. I., was held recently with the following result: President, E. L. Buffington; secretary, J. G. Edwards; treasurer, B. A. Swenson; captain, Edward G. Luther; first lieutenant, Charles W. Rayhill; second lieutenant, George W. Lane. B. A. Swenson is the oldest officer of the club, having been elected treasurer at the second annual meeting and having held the position continuously since.



The National Capitol Motorcycle Club has elected the following officers for 1913: President, E. Mitchell Dodson; vice president, Paul A. Draper; corresponding secretary, Thomas O. Wansleben; recording secretary, Fred M. Mills; treasurer, Harry B. Cohen; captain; W. F. Throop; first lieutenant, Frank Hazelton; sergeant, W. F. Throop; directors, P. N. Moulden, George W. Parezo, E. M. Dodson, Paul A. Draper, T. O. Wansleben, Fred M. Mills, W. F. Throop, Harry B. Cohen.

The Pittsburg Motorcycle Club opened new rooms to its members last month and all were pleased with the manner in which they were furnished. A surprise was a Victrola piano player and it was announced that a pool table is among the comforts to be purchased later.

The annual run to Woody, Cal., by the Bakersfield Motorcycle Club was held recently and an enjoyable programme was carried out, including a turkey dinner at the Woody hotel. The run was 31 miles over a rolling country.

The Motorcycle Club of Manhattan, Kan., has affiliated with the F. A. M. At a recent meet-

ANGOLA ERIE COUNTY NEW YORK

ing in the Commercial Club rooms an invitation was considered to join the Kansas Short Grass Club in its run next summer from Kansas City to Denver, Col., and thence to Yellowstone Park. An effort will be made to have the route include Manhattan.

At the second annual banquet of the La Porte Motorcycle Club, La Porte, Ind., it was announced that the club will soon have quarters of its own. Four race meets will be held and riders on the run from Indianapolis to Michigan City will be entertained when they pass through the city next summer. During the evening Joseph C. Smith presented the club with a silver cup suitably inscribed. It was formally accepted by President J. Earl McCurdy.

The Cleveland Motorcycle Club has already begun plans for the coming season and several suggestions have been made, including an endurance run of three days, a hill climb, a 24-hour day and night run, and at least one race meet at the Randall track. The proposition of buying a piece of property and building a club house was considered and action looking to this result may be taken in the near future.

Recent Affiliations.

Clubs that have affiliated with the Federation of American Motorcycle during past the week are: La Verne Motorcycle Club, Lordsburg, Cal., 19 members, secretary, Philip S. Danner, Lordsburg; Bellevue Motorcycle Club, Bellevue, O., 12 members, secretary, L. W. Moyer, 155 Ashford avenue; Dixie Motorcycle Club, Roanoke, Va., 21 members, secretary, J. T. Preston, Roanoke; Kensington Motorcycle Club, Philadelphia, Penn., 13 members, secretary, G. W. Lord, 3321 Kensington avenue, Philadelphia.

Additional Local Commissioners.

Edwin P. Tappan, 241 Salem street, Haverhill, Mass., has been appointed local commissioner by the Massachusetts state commissioner, and G. A. Allen, Livermore Falls, Me., has been similarly appointed in that state. P. N. Bushnell, 316 South Lincoln street, Aberdeen, S. D., has been appointed a state commissioner.

Manufacturers' Chicago Meeting.

At the recent meeting of the Motorcycle Manufacturers' Association at Chicago, the resignation of President A. B. Coffman, which was tendered in September, 1912, when he became a manufacturers' agent, was withdrawn by request and Mr. Coffman agreed to continue in office until his term expires in July. Mr. Coffman has made an efficient executive and his retention is pleasing to the members of the association. The

Where C. J. Swenson Looks After the Interests of Riders in Newport, R. I.

Davis Sewing Machine Company, Dayton, O., maker of the Dayton motorcycle, was admitted to membership.

The full membership of the association was present and represented as follows: L. D. Harden, secretary, Pope Manufacturing Company; Frank J. Weschler, treasurer, Hendee Manufacturing Company; Arthur Davidson, Harley-Davidson Motor Company; Ignaz Schwinn, Excelsior Motor Manufacturing & Supply Company; W. G. Schack, Emblem Manufacturing Company; Peter O'Horo, F. D. Freeman, Excelsior Cycle Company; F. L. Valiant, Miami Cycle & Manufacturing Company; T. W. Henderson, Henderson Motorcycle Company; R. L. Hinds, Consolidated Manufacturing Company; E. J. Knight, Aurora Automatic Machinery Company; A. J. Musselman, Allied Motors Corporation; F. E. Starnes, Minneapolis Motor Company; G. E. Atkins, Reading-Standard Company; H. A. Skinner, Schickel Motor Company; Guy M. Greene, American Motor Company; A. W. Mitchell, Black Hawk Motor Company.

Hendee Buys More Land.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has purchased a 10-acre tract of land at East Springfield, near the Athol branch of the Boston & Albany railroad. It is understood that the company will build on the land, although it has not been announced what the nature of the buildings will be or their specific use.

To License Motorcycles.

Senator Walter R. Herrick of New York City has introduced a bill in that state providing for the licensing of motorcycles. Similar action is contemplated in Pennsylvania, although in the latter instance a separate law will be enacted for two-wheeled mounts. The Herrick bill also provides for the licensing of motorcycle operators.

Baker's Riding Records.

E. G. Baker of Indianapolis, Ind., has kept a record of his performances on an Indian motorcycle from Dec. 14, 1911, to Dec. 14, 1912, and it is a formidable one. His diary shows his road mileage during that time to be 17,584.8 and track mileage 1583. In the races in which he won a place he scored 53 firsts, nine seconds and 11 thirds. He made 14 new track records, registered three perfect scores in endurance runs and lost 13 races.

Humiston's Records Clear.

J. P. Thornley, secretary of the competition committee of the F. A. M., has set at rest all doubt as to the eligibility of Lee I. Humiston when he made his world's records at the Playa del Rey track, Los Angeles, Cal., on Dec. 31 and Jan. 8. Investigation developed that Mr. Humiston's membership expired on Jan. 2, 1913, but the referee of the contest for world's records at Los Angeles took a renewal receipt for dues, which was permissible under the rules. The last affidavit necessary has been received and as every requirement was complied with the records by Humiston will stand.

In this connection it is stated that the lines relative to lapsed dues will be drawn closer this year than last. Referees of races will be held strictly accountable in every case where a rider is allowed to compete without a card fully up-to-date. If a referee fails to give the number of a

Digitized by Google

rider's card, or gives it and it is discovered, as it is certain to be, that the rider has not paid his dues to date, the referee will be fined for the omission. A rider who is discovered deceiving a referee in the matter of his dues, whether he deliberately tells a falsehood or simply attempts to enter a race, will render himself liable to suspension for a month.

New Registered Repair Shops.

The following new repair shops have been registered with the F. A. M.: O. H. Kathmann Company, 114 South Seventh street, Quincy, Ill.; Santa Cruz Cyclery, 229 Pacific avenue, Santa Cruz, Cal.; Sarver & Retz, 508 South Walnut street, Muncie, Ind.; Edgar H. Brunelle, 359 Fulton street, Troy, N. Y.; A. D. Diamond, Public square, Galion, O.; J. Johnson & Son, 3321 Kensington avenue, Philadelphia, Penn.; Harry F. Seamark, Sixth and G streets, W, Washington, D. C.; Santa Fe Trail Garage, Dodge City, Kan.; Spahr Bros., Canal Dover, O.; Medina Garage, North Court street, Medina, O.; Monarch Garage, 20 South 57th street, Philadelphia, Penn.; Knupp Bros. Garage, Court street, Sidney, O.; Carter & Turner, Huntington, W. Va.; Markley-Smith Motor Company, 204 Poyntz avenue, Manhattan, Kan.; Swint Motor Company, Box 377, Oakharbor, O.; Tyler & Brown, 6232 Broadway, Cleveland, O.; Ludden & Whitten, 24 East Elm street, Brockton, Mass.; William R. Benedict, 430 Warren street, Hudson, N. Y.; Noah Smith, 320 South Oakes street, San Angelo, Tex.; Ideal Cycle Company, 114 North West street, Bellevue, O.; Hendricks Bros., 705 State street, Santa Barbara, Cal.

Indian on Exploring Trip.

Umbrella rock is a curious sandstone formation on Lookout mountain in Tennessee, and has become one of the favorite places in that district with tourists who desire to have their pictures taken. It commands an unrivalled view of the surrounding country. An accompanying illustration shows F. L. Hunt, an Indian tourist, who recently paid a visit to Umbrella rock. He rode his machine as close as possible to the scene of his conquest, although at the time the photograph was taken the 1913 Indian mount was 275 feet below.

Will Handle Merkel.

The Boyd Motor Company, one of the most important motorcycle concerns located at Boston, has signed a contract to handle for 1913 Merkel mounts, made by the Miami Cycle and Manufacturing Company, Middletown, O. The Boyd company has inaugurated an extensive advertising campaign and the success already achieved has been such as to warrant placing an order at the factory for a carload of Flying Merkels.

F. L. Hunt, Indian Rider, at Umbrella Rock, Lookout Mountain, Tennessee.

Motorcycle Aids Telephone Company.

At Salina, Kan., a wire chief who has many calls to repair country telephones, not only uses a motorcycle to carry him quickly to the point of trouble, but he is saved the inconvenience of carrying an entire telephone equipment. He merely takes a receiver and a coil of twisted pair wire. The motorcycle is of the battery type so in order to test the wire the chief opens the line and connects the line wire to the motorcycle by means of the pair wires. To call central he pedals a few times and connects the receiver to the wire.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Lathan Auto Supply Company, San Francisco, Cal.; $25,000; incorporators, J. E. Lathan, A. Lathan, A. S. Lathan.

Vulcan Manufacturing Company, Painesville, O.; $300,000; to manufacture automobiles, wagons, etc.; incorporators, F. H. Murray, E. H. Heartwell, J. C. Ward, William Truhy, Harry E. Hammar.

Anna Motor Car Company, Anna, Ill.; $2500; general garage business; incorporators, Ernest Lawson, J. J. Corzine.

Tourraine Motors Company, Newark, N. J.; $37,500; general automobile business; incorporators, C. H. Van Vleck, F. N. Kolb, E. M. Dalley.

Pilot Car Sales Company, Richmond, Ind.; $50,000; to deal in automobiles; incorporators, T. F. Williams, H. E. Bradford, J. E. Hayes, C. E. Hayes, Arnold Schaer, W. D. Williams, E. F. Goggins.

Montroy Ignition Starter Company, Clarksdale, Miss.; $10,000; incorporators, E. M. Fant, E. Fant, C. L. Montroy, J. M. Montroy.

Collier Rotary Valve Company, Inc., New York City; $100,000; motors and engines; incorporators, John N. Blair, Arthur B. King, Harry D. Johnson.

Chaplin-Dille Motor Car Company, Morgantown, W. Va.; $25,000; incorporators, M. C. Wildman, O. Howard Dille, B. M. Chaplin, Minnie Chaplin, James E. Dille.

Chico Garage Company, Chico, Cal.; $10,000; general automobile business; incorporators, S. P. McLerran, T. H. Morgan, E. S. Sauber.

Western Auto Supply Company, Tulsa, Okla.; $5000; incorporators, Frank Wolfe, R. J. Myers, F. W. Dye.

Cragg Motor Manufacturing Company, Detroit; $4000; to make motors and accessories; incorporators, E. F. Alleman and others.

South Texas Traction Company, Houston, Tex.; $20,000; to manufacture gasoline motors; incorporators, A. E. Hall, John A. Owen, C. H. Hall.

Adix Automobile Company, Chicago; $2500; general automobile and garage business; incorporators, Percy L. Adix, Jacob Rothschild, George H. Rees.

Hanna Motor Manufacturing Company, Kansas City, Mo.; $60,000; incorporators, John M. Hanna, Frank A. Hanna, Roy J. Hanna.

Harrisonburg Garage, Harrisonburg, Va.; $25,000; incorporators, John N. Garber, J. J. Hawse, H. L. Furr.

Blacklock Tire & Rubber Company, Birmingham, Ala.; $3000; incorporators, H. Blacklock, H. H. Bostick, K. Blacklock.

WITH THE MANUFACTURERS.

The Oliver Motor Truck Company, Detroit, maker of Oliver trucks, is occupying the former Carhartt plant and will continue to make the 1500-pound light truck and the 3000-pound vehicle, which has been given a four-cylinder motor. The Oliver Motor Truck Company recently took over the assets of the Oliver Motor Car Company and the factory which it vacated has been sold to the Keeton Motor Car Company, maker of Keeton pleasure cars.

The American Locomotive Company, New York City, maker of Alco trucks and pleasure cars has announced the following appointments of agencies: Jefferson Garage Company, Syracuse, N. Y.; Pawlik & McGuidwin, Rochester, N. Y.; Merchants Auto Service Company, Reading, Penn.; Downs Company, Minneapolis, Minn.; William Motor Car Company, Kansas City, Mo.; Villamil & Miller, Havana, Cuba; Thompson Auto Company, Detroit.

E. H. Broadwell, vice president of the Hudson Motor Car Company, Detroit, maker of Hudson cars, is reported at New York City as saying he has withdrawn from the company, having sold all his holdings. Mr. Broadwell will leave for Florida, where he will remain for some time. He announced no plans for the immediate future.

The R-C-H Corporation, Detroit, has appointed the following agents to handle R-C-H cars in their respective territory: Cowles Tolman, New Haven, Conn.; D. B. Dalzell, Iliff, Col.; Hood & Currie, Bond, Miss.

M. A. Newmark & Co., a large wholesale and importing firm in Los Angeles, Cal., is utilizing 11 G. M. C. trucks, made by the General Motors Truck Company, Pontiac, Mich., which have replaced a large number of horses and wagons. In order to secure the utmost efficiency from the equipment wheeled bins are used for loading in the warehouse of the company. These bins are transferred from and to the trucks with minimum loss of time, increasing the efficiency of the delivery system by at least 30 per cent., according to the estimate of the company.

The Motometer Company, Inc., 1784 Broadway, New York City, has opened a Chicago branch at 1322 Michigan avenue. R. G. Ames has been made manager.

G. M. C. Gasoline Truck Equipment of M. A. Newmark & Co., a Los Angeles Wholesale and Importing Firm.

The Anderson Electric Car Company, maker of the Detroit electrics, has opened a new factory branch at 903 Boylston street, Boston. A service station is also located in the same building which is equipped with every facility for the maintenance of the high quality of service extended to all Detroit electric owners.

The Cole Motor Car Company, Indianapolis, Ind., maker of the Cole cars, has appointed the following distributors: F. A. Wilson, Amherst, N. S., Canada; J. P. Krall, Avon, S. D.; Davis Sparger Auto Company, Bristol, Tenn.; A. V. Hunt, Clarinda, Ia.; LaFayette Motor Car Company, Easton, Penn.; Serfas Motor Car Company, Lehighton, Penn.; Swanson Bros., Lyons, Neb.; Thomas Mabon, Northfield, Neb.; Pink, McVerty, Blackburn Company, Ottawa, Ont., Canada; G. Williams & Bros., Poplar Bluff, Mo.; Chamberlain Bros., Salem, Ore.; Trenton Motor Car Company, Trenton, N. J.; Baehr Bros., Wadena, Minn.; Morgan & Williams, Warren, O.

The Abbott Motor Company, Detroit, Mich., recently filled an order for four Abbott-Detroit roadsters, finished in white with gold stripes and red artillery wheels, for the city of Denver, Col. These cars, which are shown in an accompanying illustration, are for the use of the assistant chiefs of the fire department.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has appointed the following managers of newly established branches: J. D. Palmerlee, 548 Peachtree street, Atlanta, Ga.; C. E. Wheeler, 563 Boylston street, Boston; R. W. McMullen, 1225 Main street, Buffalo, N. Y.; H. E. Westerdale, 2021 Michigan avenue, Chicago; A. D. Caldwell, 2122 Euclid avenue, Cleveland, O.; E. W. Swanbrough, 1520 Broadway, Denver, Col.; M. D. Davidson, Jefferson and Lycaste streets, Detroit; E. E. Guthrie, 3501 Main street, Kansas City, Mo.; J. W. McCrea, 1242 Hennepin avenue, Minneapolis, Minn.; W. S. Jewell, 1989 Broadway, New York City; E. N. Stimson, 330 North Broad street, Philadelphia, Penn.; A. E. Morrison, 819 Ellis avenue, San Francisco, Cal.; Don J. Campbell, Walkerville, Ont., Canada.

Fleet of Abbott-Detroit Cars Recently Delivered to the City of Denver, Col., for Use of Assistant Fire Chiefs.

GARAGE AND DEALER.

The Glenwood Garage Company, which operated the Glenwood garage at Riverside, Cal., under the management of C. A. Dundas, has awarded the contract for a substantial addition to the plant.

The Central Vulcanizing Company, Albany, N. Y., has purchased a two-story building at 148 Central avenue and after suitable alterations have been made, will move from 357 Central avenue. Jacob Brown is manager of the concern.

O. M. Driscoll has opened a large salesroom and service station at 24 East Front street, Trenton, N. J. He handles the Hupmobile line, made by the Hupp Motor Car Company, Detroit.

The West Virginia Automobile Company, Wheeling, W. Va., has sold its garage on 16th street to a new company, the name of which was not announced. Extensive improvements are to be made it is said.

The Central Iowa Motors Company, Des Moines, Ia., has purchased the interest of the Van Vliet-Bradt Auto Company at 706 Mulberry street, and will make improvements to the garage building.

The Fleming Auto & Tire Company, Montgomery, Ala., has been formed and has leased the garage at 21 Washington street. The company will distribute the Overland line, made by the Willys-Overland Company, Toledo, O.

Perl W. Devendorf, Watertown, N. Y., has purchased the entire interest of the Warner Automobile Company at 155 Arsenal street. Mr. Devendorf will handle the Ford cars.

The Waupaca Garage, owned by **F. L. Hoaglin, Waupaca,** Wis., has been transferred to Van A. Nelson, who will also take the agencies for three well known makes of cars.

The White Motors Company, New Haven, Conn., is erecting a new service station at 1094 Chapel street, to cost $2000.

The Boonton Auto Garage & Transportation Company, Boonton, N. J., will erect another garage adjoining its present establishment on Washington street.

R. J. Moore, Glasgow, Mont., has sold his interest in the Moore garage on Market street to J. H. Aschliman, formerly of Twin Cities, Mont.

The Woodburn Auto Company, Woodburn, Ind., is erecting a large addition to its plant.

Fred Jensen and Milton Frey of Hancock, Minn., have formed a partnership and will erect a modern garage in that place. They will conduct a general automobile business and will be equipped to do repair work of all kinds.

W. H. Olds of Crookston, Minn., who conducts a garage and repair shop for automobiles, motorcycles and bicycles, is enlarging his place of business.

Charles E. Preston, Berwick, N. H., has fitted up his garage in the Clark & Davis building at Sullivan square and the business will be conducted under the name of the Preston Auto Garage Company. Mr. Preston will handle the Ford cars, which are made by the Ford Motor Company, Detroit.

Miller & Geiger, Birdsboro, Penn., has completed improvements to a building on Main street, which has been transformed into a modern garage and repair shop.

Yerkes & Pritchard, Paris, Ky., is the name of a new firm which has opened a garage and repair shop in that town.

The Sims-Thomson Garage, Waxahachie, Tex., is to be enlarged to care for growing business.

Thomas Kielty and H. Ryan, DeGraff, Minn., will erect a garage in that town which will be modern and contain an up-to-date repair shop.

Sanders Nestegard and A. C. Haimsness, Fillmore, N. D., have erected a modern garage in that town.

Abel Mitchell, Madison, S. D., is making repairs to the Tierney building on West Fourth street, to accommodate his garage and automobile business.

Charles C. Collins and Thomas S. Davidson of Denver, Col., have formed a company to handle automobile tire supplies. The concern is located at 1633 Court Place.

Ralph Peltier and Arthur R. Weld have opened an automobile repair shop on Federal street, Greenfield, Mass. They are prepared to undertake work of all kinds.

NEW STEERING GEAR.

Boyer-Miller Company Organized to Build Invention of Joseph Boyer at Detroit.

A steering gear that presents interesting features in that all parts are easily accessible and quickly adjusted is the Boyer, designed and invented in 1910 by Joseph Boyer, president of the Burroughs Adding Machine Company of Detroit. It is presented in an accompanying illustration, a sectional view of the mechanism also being included.

In the Boyer design an integral double screw of steel is utilized, having full contact with two separate bronze nuts. These are solid members,

Boyer Steering Gear, Noticeable for Full Length Contact of Screw and Nuts and Small Number of Parts.

but are adjustable by means of a trunnion collar bolt and a nut. Steering action is taken from the centre of the bronze nuts by the trunnion collar and transferred to the reach rod by the steering arm, but with the Boyer this member is suspended on ball bearings between the arm yoke and the trunnion pins.

By this arrangement the inventor claims that not only is friction eliminated, but lost motion as well. It is further pointed out that adjustments are not required and that one of these designs has been in service since 1910 without requiring attention. The parts are very accessible and the absence of keys is noted, with the exception of one in the screw. The end thrust bearings are of the self-aligning type and the full length contact of the screw and nuts makes for a large factor of safety. The gear is being built in several sizes to meet all requirements of frame construction, weight, size and type of steering wheel by the Boyer-Miller Company, Detroit.

STUTZ CREATES NEW RECORDS.

Unofficial Figures Give Earl Cooper Marks for Seventy and Two Hundred Miles.

Earl Cooper in a Stutz car created new world's record for 75 and 200 miles on a circular mile dirt track at Fresno, Cal., Feb. 10. He failed to meet the 100-mile record by 1:23. Cooper's time for the 75 miles was 1:17:05 and for the 200 miles, 3:28:05.8.

These records are not official until passed upon by the contest board of the American Automobile Association. Each official that acted at the race must be sworn and a surveyor must take oath that the track is one mile in length. When this information reaches New York action will be taken by the A. A. A.

STUDYING FUEL PROBLEM.

National Association of Automobile Manufacturers to Investigate Present Price Situation.

The National Association of Automobile Manufacturers, composed of a large number of motor car makers, has decided to appoint a committee to confer with the Standard Oil Company on the question of fuel. Alfred Reeves has been selected as chairman.

That the increased cost of motor fuel has caused much apprehension among motorists generally is recognized by automobile makers. With this situation in view they appear to have taken action which is expected to result either in a reduction in price or adoption of a plan whereby a substitute may be placed in general use.

A good idea of the magnitude of the automobile industry for 1913 can be obtained from the figures of the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos, and one of the oldest ignition houses in the country. The company has taken one order for 50,000 magnetos from the Willys-Overland Company, Toledo, O., while the orders from the Maxwell Motor Company, the Abbott Motor Company and the Chalmers Motor Car Company will total its production to 100,000 instruments.

AMENDMENTS IN OHIO.

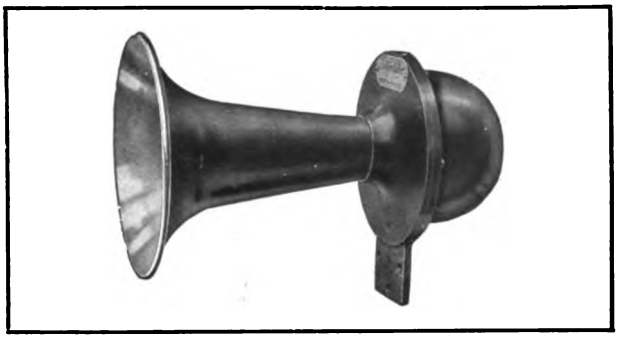
Automobile Clubs Calling Attention of Owners to Necessary Legislation.

The organized motorists of Ohio are urging all automobile owners to aid in the passage of five amendments to the present law, which are claimed to be decidedly necessary. The legal committee is actively engaged in pressing the matter before the legislature. The five amendments provide as follows:

Compelling all vehicles, whether horse drawn or motor propelled, to be equipped with lights both front and rear; emergency placard for use in the event that one of the regularly issued number plates is lost or mislaid; establishing local depots where license tags may be obtained without waiting for return from Columbus; making it clear that no city or town may enact ordinances taxing automobiles in addition to the fee demanded by the state; making it a felony, punishable with penitentiary imprisonment, for any person to steal an automobile.

THE REACTO HORN.

The Holtzer-Cabot Electric Company Announces Interesting New Signalling Device.



A desirable quality of a signalling device is its tone. To be efficient and to fulfill that function for which it is designed, that of warning pedestrians and approaching vehicles, the tone should be clear and penetrating, but not harsh. Some pedestrians are startled easily by strident notes and often become confused. The ideal horn is easily and quickly operated, of distinct value in the country when approaching blind corners, and not at all disagreeable in its tone when used within the city limits.

The Holtzer-Cabot Electric Company, Boston and Chicago, has perfected an electric horn which although moderately priced, is constructed of high grade material and with that care for which the products of this company are noted. The Reacto horn is of the simple hammer blow type, a construction that secures a direct application of the power to the diaphragm and consequently instantaneous response. The diaphragm is 5.5 inches in diameter, constructed of a high grade steel and so clamped as greatly to increase its efficiency. The heavy armature or hammer, strikes it squarely and rebounds so quickly that vibration is not retarded, preventing rasping or discord in the sound produced.

One of the qualities of the horn is that it will respond to battery voltages 25 per cent. below normal and therefore does not require adjustment. Means are provided for changing the tone, however, a knurled and locked screw increasing or decreasing the contact between the heavy platinum points. Sparking of these members is prevented by the use of a well designed condenser which also serves to improve the tone. The casing and projector are of the best material and of the proper weight. The entire construction is sturdy.

The binding posts are within the rear casing, protected from possible injury, and all carrying parts are insulated from the main structure at all times. Consequently they are not exposed to the weather or accidental damage.

The rear casing may be removed easily when connecting in circuit by displacing the retaining screws. The standard finish is japan, baked on, with nickel throat, but it is also finished with

Reacto Electric Horn of the Single Blow Hammer Type and Having a Penetrating but Not Harsh Tone.

polished brass throat or in full nickel or brass. The Reacto horn is designed to meet the requirements of motorists desiring a strictly high grade signal, one having a pleasing tone, and capable of maximum service without attention. With the normal six-volt adjustment it will operate throughout a range from 4.5 to eight volts. The company also manufactures Reacto horns for any specified voltage from four to 125, thus adapting them for electric pleasure and commercial vehicles and factories, as well as gasoline automobiles.

Benjamin Briscoe, formerly president of the United States Motor Company, has opened an automobile factory at Billancourt, France, in the heart of the motor car manufacturing district and where the Renault is made. The company is registered under the name of Briscoe Freres, and it is understood will produce a car designed for the American market, to sell at less than $1000.

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is *next to criminal.*

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'sideswiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes---well, once is too often."

Weed Anti-Skid Chains

VS.

Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when the roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make **the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours

Take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On the Rear Tires

they afford perfect traction and adequate brake control.

On the Front Tires

they act as ladders to enable the front wheels to easily climb out of mud-ruts, car tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN** your car to safety.

The Cole Technical Bulletin, a comprehensive talk on the construction of the automobile, issued by the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has been adopted as a text book by the high school of Bloomington, Ind. The book was issued under the signature of Chief Engineer Charles Crawford of the Cole company and was found so comprehensive by Prof. E. R. Glen, instructor of physics at the Bloomington high school, that he immediately procured copies for the students as a supplementary text book.

A. Escalante, a wealthy automobile dealer of Merida, Mexico, in the state of Yucatan, states that short cars only are fitted for use in the streets of Yucatan. These are so narrow that it is impossible to use cars with a long wheelbase.

There's satisfaction both in selling and owning a

Croxton "Six"

The Croxton "Six" offers you exactly what you and your customers want.

It is a car that gives your customers value received for every cent of the purchase price and makes everlasting friends for you.

The Croxton is constructed of the highest quality material and is designed for service. There is not an unnecessary part in the Croxton. It is not burdened with faddish, so-called "talking points" which are seldom good for anyone but the repair man.

You know the service records of Croxton Taxicabs. They are standing years of grinding wear at the hands of careless, irresponsible drivers.

Croxton pleasure cars are made of the same durable construction as Croxton Taxicabs.

The Croxton is made in a full line of models, "Fours" and "Sixes."

The Croxton has an absolutely reliable electric starting and lighting system; full floating rear axle; 140-inch wheel base; six-passenger body; left side drive; center control; four speeds forward, one reverse; demountable Q. D. rims; 36x4 1-2 inch tires; Thermo-syphon cooling system. The radiator is protected from damage and from mud and water splashing by being placed at rear of motor; no hot air from radiator passes over motor; motor protected by hood from dust, dirt and water. Reserve gasoline tank incorparated with cowl dash. The Croxton "Six" fully equipped, **$3,000.**

Our sales force is yet to be completed by the addition of a few good dealers.

Write or wire today for full details and specifications. Ask for booklet A-6. We can put you on the road to a big, healthy boost in your season's business.

Prime Your Motor

If you have "ALL-IN-ONE" Spark Plugs you can quickly prime your motor and easily start it on the very coldest morning. Easy priming is only one of the advantages given by the "ALL-IN-ONE" Petcock. Open the petcock while the motor is running and all soot will be blown off the sparking points—a true *self-cleaning plug*. Open the petcocks when the motor is missing and you'll quickly detect which cylinder is giving trouble—a *real trouble finder*. Open the petcock and inject a little Kerosene—this is the *best carbon remover* ever tried.

"ALL-IN-ONE" has the best features of other plugs and the Petcock besides.

Price $1.50 each.

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

> "I am simply amazed at the workmanship, material, and construction of the "BLACK EAGLE" Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

20 Miles to Gallon

G. A. Schmidt, Lawrence, gets 20 miles to gallon on his car.

4300 Miles Without Miss

The "Dream's" owner claims 4300 miles without one moment's trouble.

Power

The Planhard was on the motor winning the great ploughing contest in Argentine—$3000 prize.

Mr. Smith's Letter

THE GRAY & PRIOR MACHINE CO.

Portland Branch

117 Commercial Street, Portland, Me.

Planhard Mfg. Co.,

Gentlemen: I used one of your Planhard carburetors on the 20 h. p. model X Hartford motor in my semi-speed boat Hartford III during 1912.

My boat is well equipped to make tests, as I use a tachometer.

I get better control with a Planhard and use **practically one gallon of gasoline less per hour** than when I used one of the most popular carburetors in use today. I have put a Planhard on my automobile as well.

Very truly yours,

A. N. Smith.

You can get all the power your motor can give by using a Planhard.

STALLED

for want of a

SELF CRANKER

Every person who drives a gasoline car has had this unpleasant experience, delaying traffic, and running the risk of serious injury.

With an Electric Self Cranker your car may be started instantly, by the push of a button, without leaving your seat.

It is positive insurance against accident in a case like this, adds to your convenience and eliminates the necessity of soiling hands and clothes while wrestling with a crank before an amused audience.

Investigate the good Electric Systems for cranking and lighting. You'll probably find them operated from an LBA Storage Battery. If not, insist that yours must have an

KEETON—"The Six" Demanded By Your Prospects

"Six-48" Riverside Touring Car
$2750,
Fully Equipped

Are you selling a six-cylinder car that combines all the advantages of the latest European and American practice in construction with a distinctive French type of design at a very attractive price? Keeton is the car demanded by the public as the greatest value offered today, either at home or abroad. This "Six" is the most talked of car in this country. It was a leader from the day it was announced and stands out in a class by itself.

Buyers are enthusiastic over its remarkable qualities. Have you a car on your salesroom floor that can compare with it in construction and appearance? Go over it part by part. You will find only the very best of workmanship and materials.

The powerful small bore long stroke motor—dashboard radiating system, doing away with the troublesome water pump, fan and fan belt—electric starting and lighting system—left hand drive and right hand control—four speed transmission—imported annular bearings throughout—special alloy steels—long wheelbase—wire wheels—large roomy body with luxurious upholstery—light weight and numerous other features all combine to make it a car that is a continual source of pride and satisfaction to the owner.

Aside from the utter simplicity of the mechanical features you have a French type of design that is only found on foreign cars selling for three times the price of the Keeton.

The buying public has been quick to realize the extraordinary value offered in the "Six-48" Keeton, and we can put you in touch with dozens of purchasers right in your own territory who are anxious to see and buy this car.

Read the specifications of the "Six-48" Keeton. Compare it with any other cars irrespective of price and decide for yourself about its merits and selling possibilities.

We have a dealer's proposition that is very attractive and will make you money. You cannot afford to neglect this opportunity. Write or wire us at once.

Important Features and Brief Specifications

Electric starting.
Full electric light equipment.
Small 3¾ inch bore—long 5½ inch stroke.
Cylinders cast en bloc, large valves.
All moving parts completely enclosed.
Exceptionally powerful and flexible.
The most efficient cooling system in use today.
Radiator at rear of motor in proper and protected position.
Four speeds forward in transmission.
Direct on 3d—geared up on 4th.
Left hand drive—right hand control.

Wire wheels—option of wooden wheels.
Extra detachable wire wheel or extra demountable rim.
Long 136 inch wheelbase—long springs—special alloy spring steel—nearly flat under load.
Chrome Vanadium Gears and shafts on imported annular bearings.
Pressure gasoline feed.
Very roomy and comfortable bodies.
Best of foreign practice adapted to American road and touring conditions.

Complete Equipment

Electric starting and lighting system with 12½-inch headlights, dash lamps and tail lamp with license holder, 80-mile speedometer and eight-day clock combined with electric light, lamp for changing tires at night, with extension cord, dynamo electric horn; robe and foot rails; silk mohair top, with self contained folding curtains and slip cover; double acting rain vision windshield; option of wire wheels with extra detachable wire wheel or wood wheel with extra demountable rim; wheel or tire carrying irons; full set of tools; pump; jack and tire repair outfit; all touring bodies will take auxiliary seats.

"The Easiest Riding Car In The World"

The MARMON "32"

Marmon "32"—Five-Passenger Touring Car—$3000.00

THE graceful and beautiful lines of the new bodies distinguish the Marmon at a glance. The many refinements in equipment and appointments add to the comfort, luxury and ease of operation. But underlying all the new features is the same high standard of design, materials and construction that has made these cars world-famous in contests and service. No one can question the judgement of the Marmon owner in his choice of this car. The records of its performance are the highest indications of value.

Outline Specifications

Motor—4½"x5", "T" head, 32-40 h. p. **Oiling**—Marmon system automatic force feed lubrication. **Ignition**—Two spark dual system. **Transmission**—Selective sliding gear, unit with rear axle. **Clutch**—Cone. **Rear Axle**—Floating type, unit with transmission. Pressed steel housing. **Brakes**—Internal expanding, 403 sq. in. surface. **Wheelbase**—120 in. **Rims**—Quick detachable, demountable. **Tires**—35x4½ front and rear. **Control**—Left-hand steering, right-hand control in center. **Carburetor**—Improved automatic float feed. **Springs**—Rear, full elliptic; front, semi-elliptic. **Body**—Marmon perfected cast aluminum construction with sheet metal seat backs. Deep cushions. Nickel trimmed. **Equipment**—Electric starting and lighting system, Pantasote top, built-in windshield, speedometer and clock, electric light to illuminate entire dash, horn, shock absorbers front and rear, single tire carrier, extra demountable rim, coat rail, foot rest, assortment of tools, oiler, jack, tire repair kit and pump. **Prices**—Five-Passenger Touring Car or Four-Passenger Suburban, $3000.00; Two-Passenger Roadster, $2900.00; Limousine (seats seven) $4000.00; Landaulet (seats seven) $4100.00; prices f. o. b. factory, Indianapolis, Ind.

"The Easiest Riding Car In The World"

The MARMON SIX

Marmon "48"—(Six)—Seven-Passenger Touring Car—$5000.00

YOU may know, by a glance, of the Marmon's luxury, its beauty, its completeness of appointment, its fitness to be classed first among the best.

You may know its superiority of design, materials and construction by actual records in the hands of owners and the world's greatest contests.

But a new and different sensation, the realization of true Marmon value, grows as you come to own and admire this car for its adaptability to meet your every requirement with delightful satisfaction.

Outline Specifications

Motor—4½"x6", "T" head, 48-80 h. p. **Oiling**—Marmon system automatic force feed lubrication, delivering oil through hollow crank shaft directly into main bearings, connecting rod bearings and piston pin bearings, also through hollow cam shafts to cam shaft bearings. **Ignition**—Two spark dual system. **Clutch**—Improved dry plate multiple disc. **Rear Axle**—Floating type unit with transmission. Pressed steel housing. **Front Axle**—A new type, an exclusive feature of the Marmon Six. The vertical spindle is placed in the direct center line of the wheel. This construction makes the safest, surest and easiest steering mechanism ever devised. **Brakes**—Internal expanding, 403 sq. in. surface. **Wheelbase**—145 in. **Rims**—Quick detachable, demountable. **Tires**—Front 36x4½, rear 37x5; front and rear rims and tires interchangeable. **Steering Gear**—Left-hand with center control. **Carburetor**—Improved automatic. **Springs**—Front, semi-elliptic; rear, ¾ elliptic. **Body**—Convex curve type Marmon perfected cast aluminum construction with sheet metal seat backs. Deep cushions. Nickel trimmed. **Equipment**—Electric starting and lighting system, cape top, windshield designed as part of dash with provision for ventilation, speedometer and clock, electric light to illuminate entire dash, electric step light under tonneau doors, electric emergency lamp with long extension cord, electric horn, power tire pump, shock absorbers front and rear, tire carrier, extra demountable rim, coat rail, foot rest, assortment of tools, oiler, jack and tire repair kit. **Prices**—Seven, Five, Four or Two-Passenger Body Types, $5000.00; Limousine (seats seven) $6250.00; Berlin Limousine (seats seven) $6450.00; Landaulet (seats seven) $6350.00.

Digitized by Google

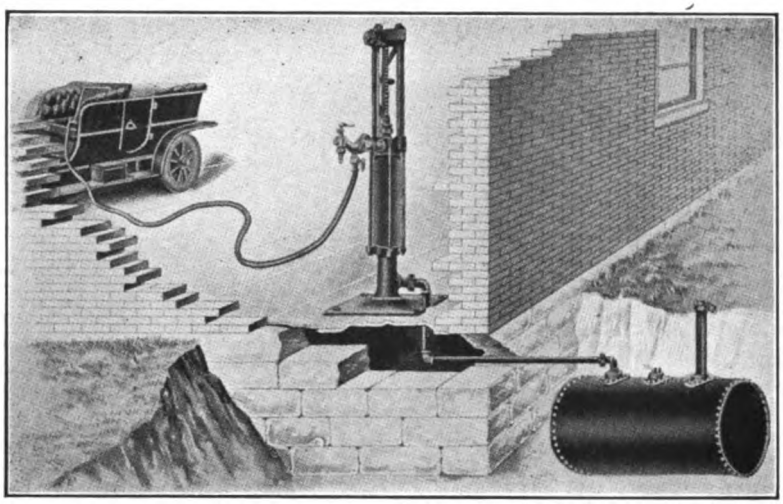
THE SIX

A six-cylinder car of the very highest type of automobile construction—a car that has created a class by itself. No essential that makes for motoring pleasure has been omitted. Driven from the left side, started by electricity from the seat, lighted also by electricity, the centre control gives complete mastery of the car under all conditions. The motor of 4 inch bore and 5 inch stroke is flexible, efficient and silent.



Fully equipped with every requisite—in fact a car perfect in construction, perfect in design and perfect in operation.

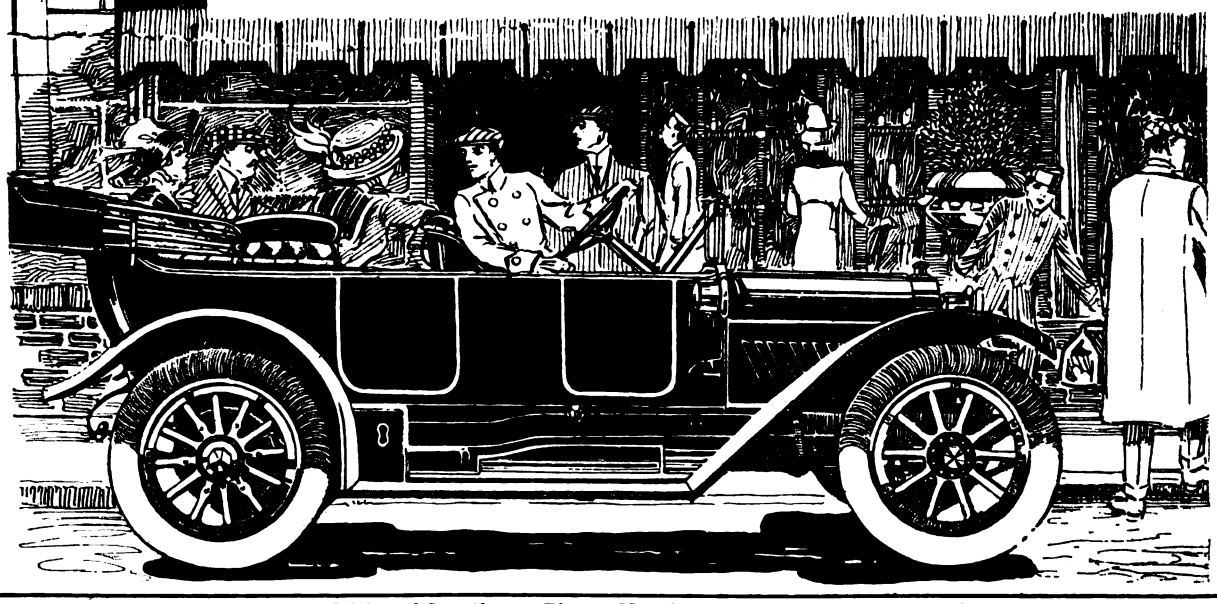
Abbott-Detroit

THE ONE PERFECT CAR

THOSE who are attending the shows for the purpose of making an unprejudiced study of motor car values, unanimously declare that all honors go to the Abbott-Detroit.

The Abbott-Detroit maintains its position as leader of motordom. It is the incomparable and unapproachable car. Persons already intimately acquainted with this superb line go away with even greater appreciation of its superior value than before. Every owner is fully convinced of the wisdom of his choice.

Some lines you have perhaps passed by with no more thought of buying or selling than were you a customer looking for all-wool goods and nothing but cotton were shown you. But when you approached the Abbott-Detroit booth you at once recognized the genuine article. You were unable to find any other car that offered such beauty, comfort and mechanical perfection at anything near the price and nothing in all-around qualities that could excel at any price.



We cannot put the truth too strongly. We are dealing in cold, hard facts. The Abbott-Detroit is the maximum car. Ask any Abbott-Detroit owner what he thinks of his car. Those who previously owned other cars are unanimous in their declaration that the car cannot be matched at any price. This is as true with those having owned $5000 and $6000 cars as those who paid much less. Unsolicited testimonials being received daily show that in scores of instances the 1912 model Abbott-Detroits have been driven from 10,000 to 200,00 miles through all sorts of weather and road conditions without a single cent being spent for repairs.

If as an owner you want a car that will give you the same consistent service year after year, you should buy an Abbott-Detroit. As a dealer you will hold your trade and insure future success by handling the only perfect and reliable car.

Bosch

Much Better
Than The
Price Implies

As Good
As Bosch
Magnetos

Plugs

fill a long felt want.---For years the ignition source, the magneto, has been perfected to the highest degree but the development of the spark plug, the "key-stone" of the ignition system, has been neglected, save to cheapen it in price to the consequent sacrifice of service and quality.

Extensive investigations into ignition problems have made possible the production of a proper spark plug, a scientific plug, in short, the Bosch Plug, one designed on correct principles, principles which eliminate the short-circuits, breakage, and loss of compression so commonly experienced with the average plug.

Bosch Plugs are designed to uphold the name they bear---they have all those attributes that characterize Bosch Magnetos as the standard ignition source of the world, all those qualities which are desired for the most excellent productions of automobile engineers.

The Peerless, Pierce-Arrow, Hudson, Mercer, Garford, Rambler, Fiat, Lancia, Metallurgique are a few examples of cars that regularly equip with Bosch Plugs.

WHY EXPERIMENT? SPECIFY BOSCH PLUGS.

"Locating the Spark Plug" is very instructive. Send for it today.

$1.00 EACH

Bosch Plugs are sold by reputable dealers throughout the United States and Canada, or they may be obtained via Parcel Post from Bosch Distributors, or any Bosch Branch.

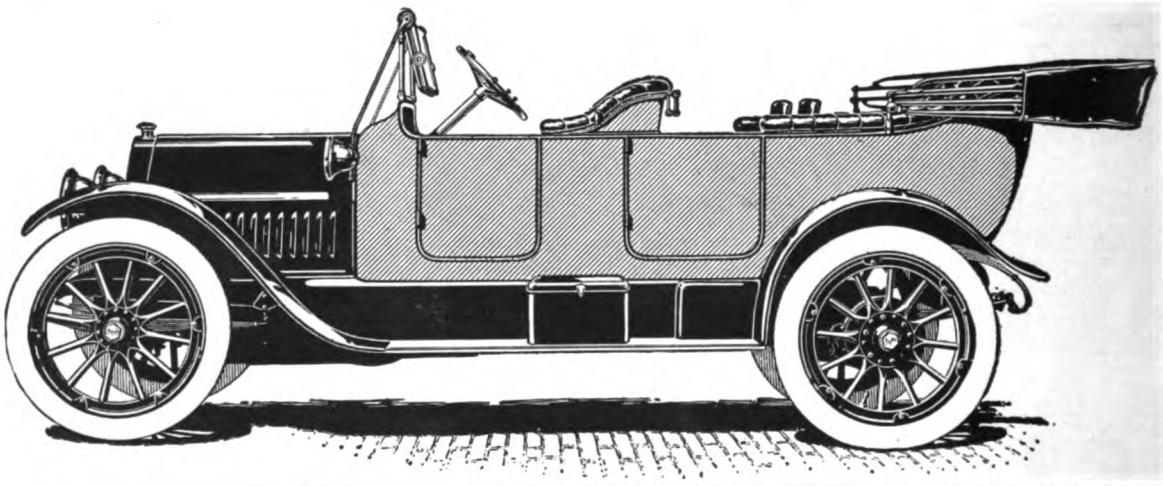
Studebaker

"35"

ALL WHO SEE THE $1290 STUDEBAKER "35" MARVEL AT ITS VALUE

An electrically lighted and started six-passenger car of high quality at $1290 is a sensation.



And the $1290 Studebaker "35" is sufficiently remarkable to have won the admiration of friends and competitors alike.

The astonishing price of $1290 would be too good to be believed if the world did not know that the Studebaker factories are the largest in the industry.

And the mechanical excellence of the car, its finish and equipment would seem also almost too good to be true, if it were not the product of the world's best, as well as largest, automobile plants.

The reasons for the remarkable worth of the $1290 Studebaker "35" are perfectly clear and the car itself is evidence no man can deny.

$1290

SIX-PASSENGER, FOUR CYLINDERS, 4 1/8-INCH BORE X 5-INCH STROKE, 116-INCH WHEELBASE

WATER COOLED MOTOR **CAMERON** FOUR SPEEDS FORWARD

"30"

5-Passenger Touring Car (Fully Equipped) $975

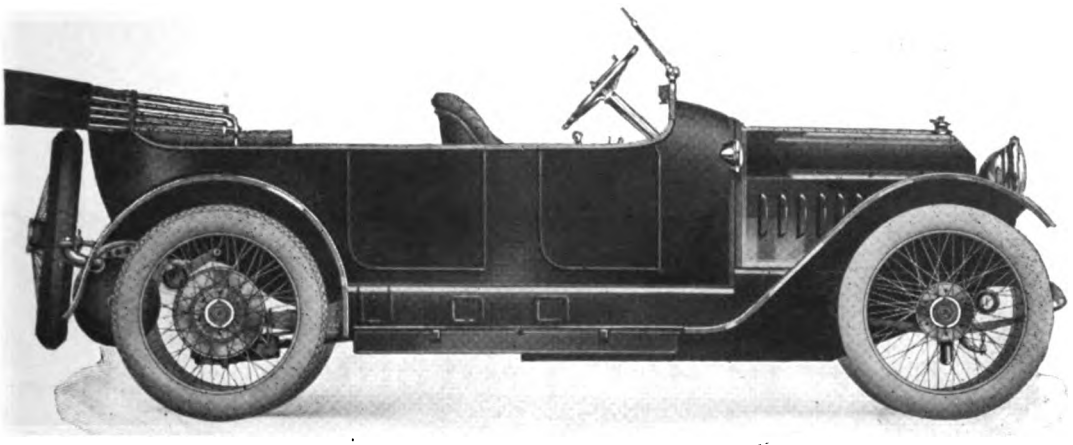
A distinctive car that has power, speed, durability, comfort, easy riding, and above all is ecomomical. The work of a master mind.

The Cameron motor is the **mechanical sensation** of the show. The engine is 3 5/8 bore x 5 in. stroke and delivers 30 H. P. It gives remarkable power and efficiency because it has side valves in the head with no pockets.

Another feature used only in cars selling from $4000 upward, is the four speeds selective type of transmission. Four speeds forward with a direct drive on all speeds.

The **car** is **cranked from** the **seat.** The crank is on the dash. This is connected by a chain to a gear that meshes with a gear on the fly wheel. This gear is slid into mesh with the fly wheel by a small foot pedal for starting, and throws out automatically. It requires little effort to start the engine.

In appearance the **Cameron** has a decided foreign aspect. It is low hung with a pointed radiator.



SPECIFICATIONS

MOTOR. 4-cylinder, 3⅝-in.x5 in., water-cooled.
VALVES. Rocker arms all on one side, driven from one cam shaft.
LUBRICATION. Automatic oiling system.
IGNITION. Splitdorf magneto, dual, throttle on top of steering wheel.
GASOLINE TANK. In cowl, 22 gal. capacity.
CLUTCH. Leather-faced cone on fly wheel, self-adjusting. Clutch pedal also operates brake.
TRANSMISSION. Cameron System, direct drive on all speeds, obtained selectively. Located on rear axle, operated by hand lever, four speeds forward.
TIRES. 32x3½-inch.
AXLES. Front, nickel steel tubular; rear, full floating type, annular ball bearings.
BRAKES. 12-inch internal expanding, with 2½-inch braking face, emergency brake operated by lever, operating brake attached to clutch pedal.
SPRINGS. Front, semi-elliptic; rear, full elliptic with scroll.
WHEELBASE. 112-inch.
CONTROL. Centre.
DRIVE. Left-hand.
RADIATOR. Tubular, almost double cooling capacity.
CARBURETOR. Kingston.
COOLING. Thermo syphon.
LAMPS. Gas or electric with Prest-O-Lite tank or battery.
STARTER. Starts from seat.
EQUIPMENT. Best silk mohair top, side curtains and top boot windshield, complete tool kit and tire repair outfit, pump and jack, speedometer, head, side and tail lamps.
BODY. Two or five-passenger.
WEIGHT. Approximately 2,200 lbs.
PAINT. Black with red or gray running gear, with similar striping.
WIRE WHEELS. Optional at $20 additional.
PRICE. $975 F. O. B. Beverly.

CAMERON MFG. CO. Beverly, Mass.

EDWARDS-KNIGHT

"The Achievement of Experience."

Designed by H. J. Edwards—one of the leading engineers of the automobile world with a record of ten years' successful accomplishment.

The elimination of experiment	Not a single untried unit in the entire construction. Every feature tested by years of use. The Knight Engine—Worm Drive Rear Axle—Four Speed Transmission, Direct on Third—Lanchester Spring Suspension—Wire Wheels—S. U. Carburetor and American Simms Magneto—Oil flow automatically increased as the throttle opens—these are some of the tried and proven features of the Edwards-Knight.
The elimination of expensive upkeep	A natural and safe ratio of power to weight is essential to reliability, sturdiness and economy. When the highest standard of materials and workmanship are combined with common sense in design a ratio of one-horse power per 100 lbs. weight is always safe—the ratio of the Edwards-Knight.
Economy in Gasoline Consumption	High priced gasoline compels attention. Comparatively small power units economize gasoline. A low gear ratio with direct on third makes a snappy car with high speed possible on fourth gear.
The elimination of exorbitant tire bills	That Wire Wheels add life to tires has been demonstrated by exhaustive tests in Europe, where they are universally used, and, when combined with the right Spring Suspension, maximum tire life is assured.
Silence	The Knight Engine, admittedly the most silent of all gasoline engines, combined with a Worm Drive Rear Axle, results in an elimination of noise which is only equalled by electrics.
Comfort	Silence, combined with a Spring Suspension which precludes the possibility of sudden jolts and jars, or the need of shock absorbers, means comfort. The Edwards-Knight is the easiest riding car in the world—yes, we mean just that and can prove it.

These points, combined with graceful body designs, elegant fittings and other features, make the Edwards-Knight the easiest selling car on the market.

Touring Car, $3500; 4-Passenger Torpedo, $3500
Speedster, $3500; Roadster, $3500; Limousine, $4600

Every Car fully equipped

Agents who follow closely the trend of the times, who are quick to take advantage of changing tendencies to increase their sales, will be interested in the Edwards-Knight proposition. Write today for full particulars.

The Death-Knell of the Makeshift Tire Repair.

There's no excuse for ever using another cemented patch or any other substitute for vulcanized tube repairs. This vulcanizer makes ***permanent*** repairs wherever you are. Carry it in your tool box and be ready at a moment's notice to vulcanize a tube puncture as perfectly as the most elaborate garage plant could. Eliminate the delay and expense of tire repairing. The Vul-Kit is so simple that you can work it the first time. Fill the puncture with Para rubber, the generator with gasoline, clamp vulcanizer on tire and light it—and in ten minutes you have a repair that will outlast the tire. Isn't it worth a couple of dollars to be able to do this?

VULCANIZER REPAIR KIT

A real SHALER Vulcanizer for $2.00

That means that it's made by the largest manufacturer of vulcanizers in this country---a firm whose product is the acknowledged standard.

Note the exclusive features that make the Vul-Kit reliable and safe. (1) A generator that transforms the fuel, gasoline, into gas and maintains the vulcanizing temperature long enough to cure a repair clear through. (2) Handle for moving the vulcanizer while hot. (3) Clamp that adapts heater to tire, insuring smooth repairs. (4) Asbestos pad inlaid in tube plate to prevent pinching tube.

DEALERS:—

Every motorist is a customer. A fine chance to clean up on a necessity that you can back with your personal guarantee. Write today for trade proposition.

Garage and Repairmen:---

There's a line of Shaler Vulcanizers for every requirement—from the Vul-Kit shown above, to a garage vulcanizing plant. No garage can give complete service to its patrons without a tire repair equipment. Ask us how Shaler Vulcanizers will make money for you.

The Stutz Is Quality Built

EVERY STUTZ car is built with as much care and pains as the costliest watch. Every ounce of material—every detail of workmanship that goes into the STUTZ is absolutely the best.

There are so many satisfied STUTZ owners throughout the country that we are not spending a nickel for national magazine advertising—we have demands for more cars than we can produce under our careful painstaking system without it. We are putting that cost into STUTZ QUALITY.

We are building less than 1,000 cars—we have demands for three times that many.

If we built more cars we could not give the attention to the many details—such as are easily slighted in a great organization burdened with quantity production.

We could not build in quantities without sacrificing the QUALITY, and we would not sacrifice the QUALITY of one STUTZ car for the greatest quantity production in the industry. We would far rather be known as QUALITY producers.

There is no watered stock; no costly branches to maintain, in the STUTZ organization.

Every nickel of STUTZ purchase price is given back to the user in STUTZ QUALITY.

These are the reasons for the superior quality of STUTZ cars—the reasons why the STUTZ gives genuine service—the reasons why every STUTZ owner is proud of his car no matter in what company he associates.

Stutz Features

Full electric light equipment with dependable generator and storage battery.
Stutz special rear system.
Timken front axle.
Gemmer "A" grade steering gear.
Force feed oiling system through hollow crank shaft.
Over-size tires.
Water-jacketed intake manifold.
Black and nickel trimmings throughout.
4¼x5 T-head motor in six-cylinder models.
4¼x5½ T-head motor in four-cylinder models.

The New Jones Speedometer

A Non-Magnetic Speed Gauge

of Modern Construction, the Accuracy of which is Unaffected by Dynamos, Climate, Heat or Cold

Now Comes the Ultimate in Speedometers

Mr. Joseph W. Jones' Pride Work

This is a day of achievements in every line of work. In every field some man stands out as the maker of some superior product.

In the making of speedometers in 1913, this man is Joseph W. Jones. Mr. Jones invented the first Speedometer, the Taximeter, the Disc Record used on most talking machines, the Autolog (the Recording Speedometer), the Electric Horn and forty-five other patented articles.

But the New Jones Speedometer is his pride-achievement.

For, in the New Jones, his master instrument, a new standard of speed indication is set, to meet the new motor car conditions.

Dynamos Don't Affect It

The New Jones, being non-magnetic, is absolutely unimpaired by any influence from the dynamos now carried by modern cars. It is not affected by heat or cold or any kind of climate. It registers perfectly always and everywhere. It tells the actual speed of the car on the moment you attain it. No wavering. No tardiness. No doubt. No guess-work. Every man must prefer it, sooner or later, if he wants to know his car's actual speed.

What Some Tests Showed

Several rival speedometers tested out in the laboratories of Columbia University, Armour Institute and the United States Bureau of Standards, showed variation under different temperatures of from 20 to 35 per cent., or 13 to 17 miles per hour. The Jones variations in these same tests were practically imperceptible. Write for the records See what they show.

The World's Final Authority

The Jones, tested out with fourteen other makes in trials by the Royal Automobile Club of Great Britain and Ireland, and in which were American and foreign makes, won first prize on all points and obtained the club's gold medal. This club is regarded in Europe as the World's final authority on matters pertaining to motor cars. We will send you the club's report if you want it.

Double-Page Ads to 15,000,000 People

We are telling these facts to 15,000,000 people through the Saturday Evening Post and Collier's, and other magazines. Double pages each month. Think of that influence. Every motor car owner, before we get through, will read a double-page Jones ad. A general preference for the New Jones must be the inevitable result.

A World-Wide Jones Service

Ask about the Jones Service to car makers and users. Jones Branches and Agencies are established in all of the principal cities of the World, in charge of men of the highest type. They stand behind Jones instruments. They will insure every man's satisfaction.

Write for information about a few uncovered territories and the Jones proposition for closing them up.

There was never another speedometer so accurate, so carefully built or so carefully maintained in service.

Write "The Jones Speedometer" today, Broadway at 76th Street, New York.

Before you contract for any instrument, see where the speedometer demand is coming from in '13—see what speedometer the motorists want.

20 Miles to Gallon

Lawrence, Mass., July 13, '12.

Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to any one. G. A. SCHMIDT.

20 miles to gallon is not unusual for Planhard.

Two Years Without Adjustment

Brenham, Tex., June 29, 1912.

Gentlemen:—Do you furnish extra gasoline needle valve for the "Planhard" carburetor? If so, please let me know what the price is. I have been using your carburetor for two years on a Sheffield motor car, and it is the first repair it has ever required. R. WEBB.

Cadillac Owners

Edgewater, N. J., May 21, 1912.

The Planhard Mfg. Co.

I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction **over nineteen miles** to the gallon. This is on my Cadillac.

Yours very truly,
JOHN H. HINNERS.

Ford Owners

Chicago, O., July 1, 1912.

Please find draft enclosed to pay for "Planhard" carburetor for my model S Ford car. It is very satisfactory; in fact, I have never bought anything for the car that I paid so cheerfully for, as I have a smoother running engine with more power, and get **more mileage per gallon** of gasoline, and my engine runs much cooler. H. W. GRANDON.

Gallon Less Per Hour

THE GRAY & PRIOR MACHINE CO. (Portland Branch)

117 Commercial St., Portland, Me., Jan. 13, 1913.

Gentlemen:—I used one of your Planhard carburetors on the 20 H. P. model X, Hartford motor, in my semi-speed boat, "Hartford III," during the season of 1912. My boat is well equipped to make tests, as I use a tachometer.

I get better control with a Planhard and use practically one gallon of gasoline less per hour than when I used one of the most popular carburetors in use today.

I put a Planhard on my automobile as well. A. N. SMITH.

Improve Operation

SHERIDAN GARAGE,
Sheridan, Ind.

Planhard Co., July 8, 1912.

Gentlemen:—Herewith find check. The carburetors are O. K., displacing two others of well known make, and improving operation of car.

H. B. JOHNSON.

Superior to Ordinary

HOWE & MEEHAN,
Wellesley, Mass.

Planhard Mfg. Co.

Gentlemen: — Please find money order inclosed. Carburetor is far superior to the ordinary. Very truly yours,

W. E. MEEHAN.

3 3-4 More Miles Per Hour

When Planhard carburetors were put on the 6 cylinder 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M. and 3¾ more miles per hour.

More Speed

Planhard Mfg. Co. Groton, Conn., Feb. 8, 1913.

Dear Sirs:—I have put a Planhard on my single cylinder 6-8 H. P. Goshen Engine. It is ahead of anything I know of. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do. Yours truly, E. A. SCRIVEN.

Planhards were on the Loco-Victor, Emerson and Metropolitan motors, taking Old Glory II, The Dream, Emerson III, Alfred S., and Valiant II to victory; and the Holt Tractor winning the Argentine Government $3000 plowing prize.

A-40—Two-passenger roadster on same chassis—$1475

Real Evidence of the Unusual Value in

Cutting
MOTOR CARS

When you inspect the Cutting for the first time, you will find it fairly bristling with the evidences that stamp it the superior of cars of like price.

You will encounter them all through the car—all evolved by years of experience and all refinements that make for increased comfort, increased convenience and economy of operation, increased safety for the passengers, and longer life for the car.

For example, the rear crankshaft bearing is 4 inches long—quite unusual for a four-cylinder motor. The other two are correspondingly liberal—2¾ inches—and all are of Parsons white bronze.

The intake manifold is water-jacketed its entire length—always warm when the motor is running and making complete the vaporization of the low-grade gasoline now in use.

Motor cooling is assisted by longitudinal ribs on the exhaust manifold, the hottest part of the motor.

The self-contained force feed type of lubrication in connection with the Cutting is another feature of especial importance. This method of lubrication is not only the most practical, but the most efficient and economical ever devised, one gallon of oil averaging 500 to 600 miles.

Our brake equalizing system assures the same amount of brake pressure on each rear wheel which helps eliminate skidding, not only is the brake action smooth and easy, but always positive.

Forty horsepower motor, wheelbase of 120 inches, self-starter, electric lights, 10-inch cushions, 36x4-inch tires, complete equipment and black and nickel trimmings—these are some of the other evidences that will impress you in the sum total, with the Cutting's extraordinary value.

Sincerity of effect, and an organization that works as one man to attain one end—and that end an ideal of quality—these are responsible for the Cutting at $1475.

We want you to see the car—at one of the shows or at the Cutting dealers—and we want to send you the literature.

YOU can't fool all of the people all of the time. The Etablissements Bergougnan, of Clermont-Ferrand, France, have been making Gaulois Tires for seventeen years. While most of the present day tire companies were still manufacturing rubber hose, this pioneer house had agencies and branches in all the capitals of Europe and in the chief cities of South America, Asia, South Africa and Canada.

Gaulois Tires have been tested over the steppes of Siberia and the pampas of of the Argentine and favorably known from the Danube to the Orinoco. Their popularity has grown from year to year, until at the present day the manufacturers are hard pressed to satisfy the public demand with an output of 1000 casings and 2000 inner tubes a day to say nothing of bicycle tires and solid tires for commercial vehicles

A Quality Tire for discriminating buyers

A clientele of this magnitude was not acquired by accident. It was built up through a reputation for quality born of years of experience.

Users of Gaulois Tires know through actual test that no other tire made can give the service and satisfaction put into the Gaulois by its makers.

There are cheaper tires then Gaulois Tires but none better. They are made to last. No extravagant guarantee goes with them other than that they are made of the finest material procurable and by the most improved process known.

Gaulois Tires represent the utmost in mileage, comfort, strength, resiliency and durability. All we ask you to do is to equip your car with two tires of whatever make you consider the best and with two Gaulois Tires. We will abide by the results.

ATTENTION

Truck Manufacturers
Makers of Parts

The New England agents for and dealers in wagons and trucks will do business of large proportions the next few months. The foundation of this business will be established at the Boston show. Those who have well known agencies will reap the benefit of the publicity they obtain; those who will introduce machines will profit to the extent that their connections are known.

The Boston shows have always been buying shows. The visitors are from all New England. The service wagon show is for business men. They are interested. They want to buy. They have decided they must use motor trucks and wagons, and the question is, Which will best meet the requirements?

Per capita New England owns more service wagons than any other section of the world. Yet the field has not been scratched. New England's business in the motor vehicle industry is greater than ever before. This is because the buyers and the capital to buy are here.

The MOTOR TRUCK, March issue, to be mailed prior to the show, will reach more owners of power vehicles and more who are investigating haulage problems than any magazine published. It will be largely given over to feature articles on actual service in New England. Not theory, not demonstration, but the real experience that is valuable, because the articles deal with practical work by practical men.

You can have representation in such a magazine at such a time but once a year. The time is the March issue. It will reach the right people at the right time. You want to sell, and the people want to buy. The MOTOR TRUCK IS WHERE YOU ALL MEET.

Last Form Closes March 15. No Proof Submitted After March 12. Wire Your Order and Send Your Copy.

Here's a lesson for all new owners of cars—especially new owners of new cars

We want to reach you and teach you before you start your motoring career.

Know this: A motor car is essentially a power plant plus a system of shafts, bearings and gears. The real wear which disables and destroys, falls upon these mechanical units. Beautiful paint and upholstery can fade or crack but still your car remains a valuable machine if the working parts are true and silent in operation.

The car manufacturer puts his brains and money chiefly into these working parts---bearings and gears. That is where you must use supreme prudence and care if you wish long service from your car.

Lubricate every bearing systematically with NON-FLUID OIL.

That is advice reiterated now for fifteen years---advice which has helped thousands and thousands of motorists to realize service value from their car investments.

It is advice which has been strengthened and spread by over seventy manufacturers of cars who have tested the failure of other lubricants and proved the success of NON-FLUID OIL.

We cannot prove to you with bald statements that NON-FLUID OIL reduces friction to a harmless degree nor that it removes the nightmare of wear and tear. Friction diagrams, chemical shop talk, claims, comparisons, disparaging statements about other lubricants---all these things are a worthless means to urge conviction upon you.

We simply invite you in your own interest to use NON-FLUID OIL this first year.

If your dealer does not sell it, you will have to look elsewhere. Don't be tempted to accept another kind of lubricant. Don't do it. Be sure you get genuine NON-FLUID OIL packed in orange colored cans bearing this trade mark.

TRADE MARK REGISTERED IN NON-FLUID OIL UNITED STATES PATENT OFFICE

Get it surely, or write us for it. We will ship it prepaid and arrange for your future supply with some dealer who will carry a stock.

NON-FLUID OIL is made in several grades and is sold in 3 lb., 5 lb., 10 lb., 20 lb. and 50 lb. cans.

K-000 Grade—for all the grease cups, for universal joints, steering knuckles, wheel hubs and for differentials requiring a heavy lubricant.

K-00 Special Grade is for sliding gear transmissions and for differentials which are oil tight. This lubricant has been so exceptionally successful for gears that it is regarded as a standard for this work. Other grades for timing gears, pump, etc.

Read "Lubrication of the Motor Car."

This is a complete treatise on lubrication, including a splendid LUBRICATING CHART, Write us for free copy. Read carefully. You may secure a copy of this booklet at our exhibit at the Boston Show. We are located in Space F-555. Address Motor Dept.

NEW DEPARTURE BALL BEARINGS

American Made for American Trade

A review of the 1913 models of American built cars exhibited at New York and Chicago demonstrates a marked increase in the use of ball bearings in preference to those of other type.

AMERICAN

If it is desirable to mount rotating parts upon a journal possessing less friction and requiring less work to drive than does the plain bearing, it is only reasonable to use that type of journal possessing the least friction, requiring the least power to drive, and, therefore, the most efficient.

GENIUS

The ball bearing is ten times as efficient as a roller bearing under same load conditions, and thirty to fifty times as efficient as a plain bearing.

ALWAYS

The American made New Departure is the quality bearing of the world. This bearing is to be found in 80% of the cars manufactured for 1913 selling.

WINS

See the New Departure demonstrated at the Boston Show, Space No. 430, Balcony, March 8th to 15th.

A pamphlet discussing the relative success of all types of bearings in eliminating friction is now on the press. Send for your copy today.

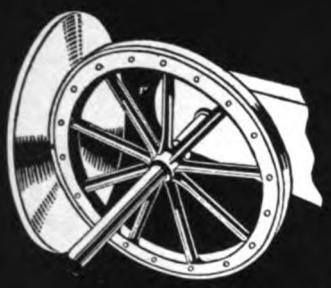
Why Not A Hoffecker?

The "STEADY HAND" SPEEDOMETER, which has been built to New England *standard of efficiency*, is the honest endeavor of seven years' experience in the development and manufacture of speedometers, in which the primary essential has been *quality* FIRST, LAST and ALL THE TIME.

The 1913 product is the climax of *perfection* in speedometer refinements and improvements. The HOFFECKER PRINCIPLE—CENTRIFUGAL FORCE—eliminates all possibility of bad effects resulting from Electrical Starting and Lighting Devices so common now in motor car equipment.



All our 1913 models will be on exhibition at SPACE F-503 at the BOSTON AUTOMOBILE SHOW, March 8th-15th. NEW DESIGNS—NEW FEATURES—NEW PRICES. Don't fail to see them—and note the display of original designs made for Manufacturers' Special Equipment.

The Gearless Transmission!

Cranked and Lighted Electrically

Model 5 A Completely Equipped $1700

WHY RISK DISAPPOINTMENT?

Why not purchase a motor car with a perfection pedigree while you are about it? There is ten years of reliability behind every CARTERCAR you buy. These ten years have been devoted to careful consideration of what constitutes the highest standards in motor car creations. The result is that an abundance of quality is admirably blended in the CARTERCAR.

In these ten years of brilliant achievement there have been but few simple changes. The vital features of the CARTERCAR of today are practically the same as those of a decade ago.

THE GEARLESS-TRANSMISSION is still the source of safety and satisfaction it was when the CARTERCAR was first introduced to the automobile buying public. It has withstood the assaults of time and is now the same perfect transmission it always has been. An unlimited number of speeds is attained by pushing one lever forward or backward.

But not only in CAPABILITY and POWER does the CARTERCAR stand preeminently alone, but also in the matter of Appearance and Luxury. It's generous wheelbase gives the occupants plenty of room to enjoy the wealth of deep upholstery. Everything which stands for motoring enjoyment and ease is included in the artistic makeup of the CARTERCAR.

It is offered in four excellent types: Touring Car, five passenger, Price $1700; Sedan, five passenger, Price $2000; Colonial Coupe, Price $1900, and the Roadster, Price $1600.

All CARTERCAR creations are ELECTRICALLY CRANKED and LIGHTED.

If CAPABILITY, COMFORT and CONSTANCY appeal to you, consider the CARTERCAR

BOSTONS' NEW ENGLAND SHOW

"Boston State-House is the hub of the solar system. You couldn't pry that out of a Boston man if you had the tire of all creation straightened out for a crowbar."

The Autocrat of the Breakfast-Table.
Oliver Wendell Holmes.

SPRING FEVER

"I want to go to Boston. There's something in the air:
The breath of spring, some restless germ unnamed—it's everywhere!"

"'Twixt you and me 'twere sweet to put a temporary gap
And go and sit awhile in Boston's calm, commodious lap."

"O Boston! sweet are your delights; and, though they may seem vain
To minds austere, my spirit craves the taste of them again."

"O heavenly town when one is tired! This good one may discern
In you that heaven has not: Since one may taste you and return."

Edward Sandford Martin.

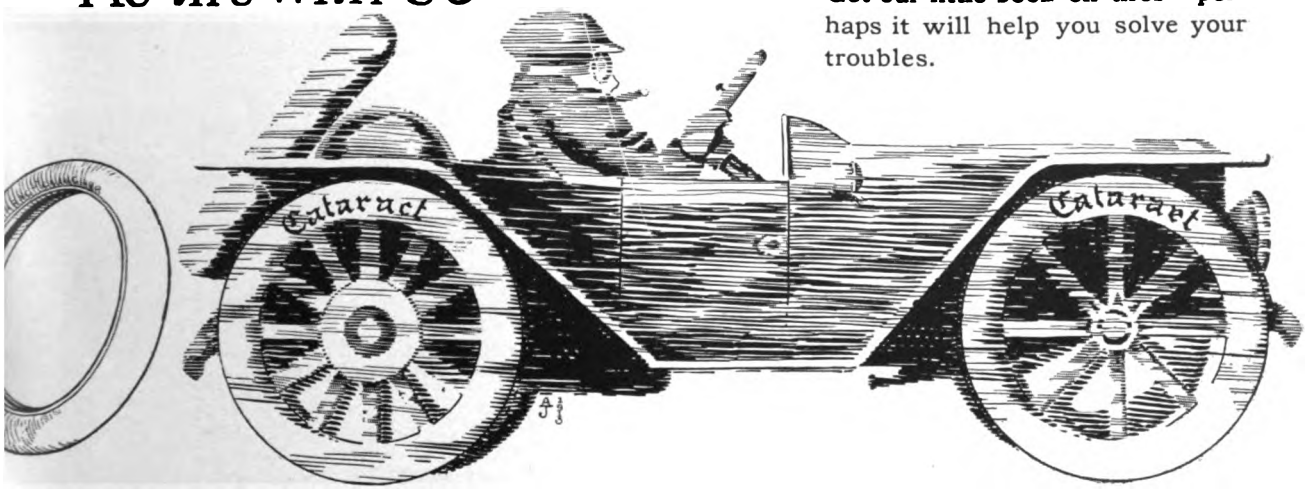
TIRES
Guarantee
MR. CAR OWNER

No item connected with the upkeep of your car is so momentous as your tire bill. You have tried them all---listened to all kinds of arguments---read lots of circulars---all with the same results---Poor tires---big bills.

As long as you run your car you will have to face the tire question. Why not turn over a new leaf and buy tires that are built right and perform right.



QUALITY TIRES

Cataract tires are produced from materials equaled by none on the market. Everything in their make up is of the best. It costs us more to produce Cataract Tires per pound than any other tires constructed in this country. They positively wear longer and give better service. BIG STATEMENTS BUT WE PROVE THEM.

4000 Mile Guarantee

Our goods are high quality goods built to give the best and longest service and for that reason we fear no guarantee---4000 miles we place on them, but read our testimonials and see what they have actually performed. Space 241 C is where you will find us at the Show. Drop in a few moments. Get our little book on tires---perhaps it will help you solve your troubles.

—Re-tire With Us"

Use Business Judgment in Buying a Car

DO you buy a motor car as you do theatre tickets? The old idea that you could not combine business judgment with pleasure in a motor car investment is wrong. You can if you get the right car. Buy something more than temporary enjoyment—buy a real tangible asset that will not only give you the desired pleasure and service, but still leaves you valuable property after the first, second and third season's work. Only a car of the National's quality can do this for you.

Money Cannot Buy Better Materials Nor More Elegant

Long stroke (4⅞ x6) flexible and noiseless Motor with enclosed valves.

Left Side Drive.

Center Control.

Gray & Davis Electric Starter, easily operated by simply touching a button with foot.

The KisselKar 60 H. P. "Six"---a history maker of the industry ---a car of advanced standard---of comfort, flexibility and distinction

No other car has made such an impression on the industry as this $3150 KisselKar 60 H. P. "Six." This model has had much to do with the new trade-wide impetus toward sixes, and the readjustment of prices.

The KisselKar "Six" was early to disclose the effectiveness of manufacturing economies in producing the highest type automobile at from one to two thousand dollars less than the former price standards on six cylinder cars. It was the modern-priced "Six," and it set a new standard of value which the industry has accepted, and, while its price is approximated, it is still conspicuous because of advanced standards of comfort, roominess, flexibility and distinction.

KISSELKAR

The new favor of the "Six" is simply the appreciation of the smoothness of six cylinders—the steady stream of power obtainable only in a six-cylinder motor.

The generous wheelbase makes possible the roomy tonneaus and unusually deep seats, which give a new distinction and riding comfort to the KisselKar, and gives the car the perfect "balance" which makes it easy steering and "light on its feet" in picking the road.

Liberality of design extends to every part, providing bigger wearing surfaces and greater safety margin, which mean greater durability, and lower upkeep.

"Thirty"	$1700	"Forty"	$2000
"Fifty"	$2500	60 H. P. "Six"	$3150

Electric Lighted and Started—fully equipped and appointed.

Every KisselKar model offers a **distinctive** value, an advance standard of comfort, and an engaging individuality which belongs to the KisselKar exclusively.

1500 lb., 1, 1 1-4, 2, 3, 4, 5 ton Trucks, Delivery Wagons, Fire Department Apparatus, Hearses, Ambulances, Police Patrols, etc. Write for special truck catalog.

KisselKar Service

KisselKar Service is supplied by the manufacturer through a national service organization, with specially equipped buildings as service-centers at principal points. The detailed care given every KisselKar, both pleasure model and truck, sets a new standard of obligation assumed by the manufacturers.

Write for KisselKar catalog, illustrating all models. It will give you a new standard for comparison, and aid you in judging automobile values.

No-Rim-Cut Tires 10% Oversize

Our Average Profit $2.90 per Tire

Goodyear tires sell all the way from $15.55 to $104.95, according to size and type.

The most popular size—34x4—costs from $32.95 to $37.90, differing with type and treads.

And our average profit on all these tires last year was exactly $2.90 per tire.

This is why we tell you:

The worth of a tire depends, in large part, on what the maker puts into it.

Tires may be made at half our cost, yet the cost per mile is greater.

Tires may be skimped to increase factory profit, but the skimping shows up in your tire bills.

The best way to show what you get in the Goodyear is to state our profit, probably.

That's why you get tires built as we build them for what the Goodyears cost.

That's why, at this price, you get tires that can't rim-cut—tires 10% over the rated size.

That is why No-Rim-Cut tires, on legions of cars, have cut tire bills right in two.

And that is why Goodyears have come to outsell every other tire in existence.

We are the world's largest tire builders, yet our capital is only $10,000,000. We have no bonded debt.

Our mammoth output and our modern methods bring making cost down to the minimum.

What we save in these ways goes into tire mileage. And the meters on countless cars are showing what this means to users.

That's the only reason why our last year's sale exceeded the previous 12 years put together.

Write for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires.

Rust eats tires; rusty rims increase tire trouble and expense

Outside tire protectors save you from most tire troubles; not from one of the worst: iron rust.

You can see for yourself how these destructive rust flakes on your rims have rotted the rubber in your casings. That's not all they do. They "freeze" the tire to rim or to the bolts of your demountable; make tire changes much harder work.

You can prevent all this; you can keep the rims from rusting; make tire changes easier, save money and trouble by painting your rims twice a season with

THOMAS' ANTI-RIM-RUST PAINT

This is a scientifically-compounded metallic paint, containing para rubber and graphite. Besides its wonderful usefulness in preventing destructive iron rust and making tire changes easier (especially when used on the rim bolts and lugs of motor trucks), it makes a lasting and efficient lubricant for spring leaves.

Get a can today from your dealer; if he is out of it, send one dollar to us; brings you full-sized can—enough for eight rims.

To Dealers

Thomas' Anti-Rim-Rust Paint will be a fast-moving item in your stock; all car owners will ask for it. Discounts are extremely liberal. Drop us a line if your jobber can't supply you.

JACKSON "OLYMPIC," $1500

Thirty-five horse power, unit power plant; four cylinder, long stroke motor—4⅛x4¾ inches. 115-inch wheel base; 34x4 inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Gasoline tank under dash, supplied from storage tank at the rear, with pressure pump. Total capacity, 20 gallons. Complete equipment, including Disco Self-Starter, mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash. Prest-O-Lite tank, with automatic electric lighter. Firestone universal quick detachable demountable rims, extra rim, tire carrier, robe rail, foot rest, pump, jack, tire outfit and tools. Trimmings, black and nickel. Electric starter and lights, optional, at an extra cost of $225.

How the Jackson Dealer is Fortified Against Competition

Three models constitute the Jackson line for 1913—two four and the splendid new six.

Each is fitted to combat competition in the most telling way—competition in comfort, in ease of riding, in size and power—in everything that influences the buyer.

With three price figures—$1500 for the "Olympic," $1975 for the "Majestic" and $2650 for the "Sultanic" six—the dealer has another mighty weapon at hand.

Each model is equipped with a self-starter—Disco for the "Olympic"; and electric for the other two, with electric lighting systems as well.

But we do not stop there.

We help the dealer by advertising the comfort, convenience, riding ease and silence of Jackson cars in a big, generous way all over the country in the biggest and best national advertising mediums and in the metropolitan newspapers.

In other words, having given the dealer cars he can sell against anything in the market, we help bring prospects to his door.

The attitude of present Jackson dealers is interesting and enlightening.

They are all enthusiastic over the 1913 line.

Every one of them has increased his quota; because every one of them saw the wonderful sales possibilities in the new line.

Jackson "Sultanic," $2650

Seven passenger, six cylinder, 55 horse power, unit power plant; long stroke motor, 4⅛x4¾ inches; 138-inch wheel base; 36x4½ inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Gasoline tank under dash supplied with storage tank at rear, with pressure pump. Total capacity, 20 gallons. Electric starter, electric dynamo and lighting system, mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash, demountable wheels, extra wheel, wheel carrier, robe rail, foot rest, pump, jack, tire outfit and tools. Trimmings, black and nickel. Five passenger, $2500.

Most of these men have sold Jacksons for years. Some of them have grown up with the Jackson.

They are men of experience and good business instinct. And with unanimous approval they accept the new Jacksons as the best selling line we have given them.

Dealers who are interested should not delay getting in line for the big spring business ahead of the Jackson.

Jackson "Majestic," $1975

Forty-five horse power, unit power plant; four cylinder, long stroke motor, 4½x5¼ inches; 124-inch wheel base; 36x4 inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Electric starting and lighting system, dynamo and storage battery. Equipment of mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash, Firestone universal quick detachable rims, extra rim, tire carrier, electric horn, robe rail, foot rest, pump, tire outfit and tools. Black and nickel trimmings.

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00

MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals, and our special nine passenger body.

Write for complete description and any information you may desire in regard to our two-speed axle.

SPLITDORF

"Always There"

SPLITDORF MAGNETOS are the most EFFICIENT because they are "always there with the goods."

Fundamentally correct, the low tension system is manufactured on a scale of thoroughness and perfection sponsors of the finished cars require.

No stone is left unturned to make this ignition unit dependable at all times for a hot, fat spark the racer demands and the tourist desires.

SPLITDORF MAGNETOS are the most economical because they are the most RELIABLE.

Self-starters are hardly necessary with SPLITDORF equipment, because you are always able to throttle down to a snail's pace with the positive certainty of starting on a quarter turn under all conditions.

Minor structural changes give the latest SPLITDORF models a more compact appearance—their reliability is guaranteed.

The non-vibrating "T S" SPLITDORF COIL—the latest and most finished of all types of coils, is notable in that it is equally effective with all the newer, as well as older models of the famous SPLITDORF low tension system.

Its neat appearance on the dashboard, with kick switch, ignition button for battery connection and lock and key for the whole operation, is only in keeping with its real effectiveness and durability.

SPLITDORF IGNITION devices are guaranteed for their efficiency---PLUGS, SPLITDORFLITE electric lighting generator as well as MAGNETOS and COILS. We will gladly shoulder all responsibility for a change over to our superior system.

Still The Car

By R. E. Olds, Designer

Consider this:

After 26 years spent in car building—

After 62,000 of my cars have been run—

Reo the Fifth, my latest model, still stands at the top of its class.

Say what you will about my over-caution—

My analyzed steel—

Machine-tested gears—

Oversize tires—

Tests and inspections.

About all the extremes which cost me, I judge, about $200 per car.

This fact remains:

There is a greater demand for cars of my building than ever before in my history.

For nearly two years, the demand for Reo the Fifth has averaged twice our factory output.

And you know the fate of many a car which wasn't built like this.

This New Car

Has a center control which is very unique and convenient—

Left side drive—

Pedal brake levers—

190 drop forgings—

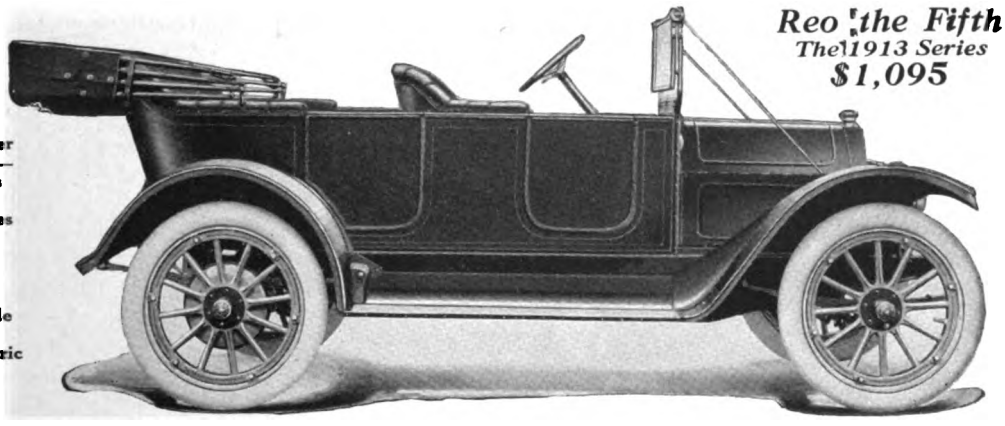
15 roller bearings—

A $75 Magneto—

Three electric lights—

A 17-coated body—

Big tires, big brakes, big springs—very large margins of safety.



It shows my idea of an honest car, and all men seeking such a car should see it.

Dealers in a thousand towns. Write for our catalog and address of the nearest.

Walpole Tires

"NO STONE BRUISE"

MAKING MILEAGE

We have made the Walpole Tire a tire of longer service because we have put more mileage into it in the factory.

With rubber and fabric we have combined exact tire knowledge, experience and scientific designing.

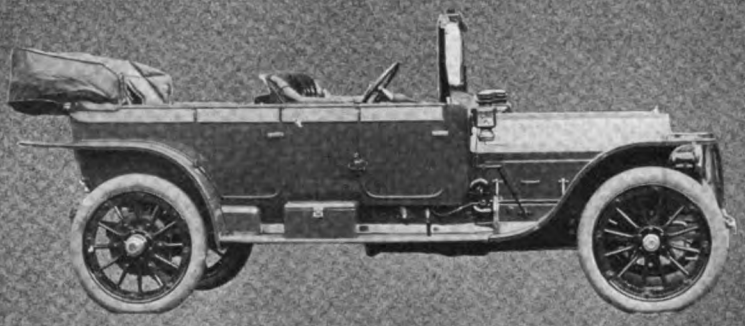
And our experts in tire making have at their disposal the best in facilities and materials.

By constructing a tire with extra heavy side walls and extra tough tread, we are able to give an absolute

Guarantee Against Stone Bruise

which has been the greatest source of tire trouble.

Walpole Tires, giving longer service--(4000 miles guaranteed)—less liable to damage—are "the tires of the future." Equip your car now with Walpole Tires and you are years ahead of ordinary tire troubles.



Be sure to look us up and thoroughly investigate the Walpole Tire at the Boston Show, March 8-15---Space E 425.

WHITE SEVEN PASSENGER SIX
Electrically Self Started and Lighted

WHITE ECONOMY

Is Actual Economy

THE small bore, long stroke White Engine introduced actual engine economy in gasoline and oil, into this country nearly four years ago.

Now that the need for economy is becoming absolutely necessary, White supremacy in the efficiency of its simple engine is recognized. And White economy goes farther. It includes in its scope wear, repair and tire cost.

Proportions of weight, engine power, and wheel base are carefully balanced to meet the requirements for which each model is specifically built. Add to this the wonderfully few parts in White Cars, and the care with which every piece of material is selected and finished, and White supremacy is acknowledged and White economy is the result.

And White Owners Know It

THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 3 MARCH 10, 1913 Price, $1.00 the Year

THE BIGGEST AND BEST BOSTON SHOW.

A Dealer's Exhibition That Exceeds All Others in Business Transacted--How Manager Campbell Stages America's Greatest Automobile Display.

WHEN any enterprise has achieved a reputation that can be regarded as placing it in a superior position, it becomes necessary to put forth even greater efforts in order to retain that supremacy. The annual display of the Boston Automobile Dealers' Association has long been conceded the biggest and best show of the year — biggest in number of exhibitors and in attendance, and best in the matter of business transacted. It follows that every effort has been put forth to make the 11th annual Boston show for pleasure cars, which opened in Mechanics' building for one week, March 8, bigger and better than ever before. The separate exhibition of business vehicles will take place amid the same surroundings, March 19-26, under the auspices of the Boston Commercial Motor Vehicle Association. Chester I. Campbell is manager of both displays.

Interior of Grand Hall, Mechanics' Building, During the Progress of the Fifth Annual Boston Show, 1907—Insert, Chester I. Campbell, General Manager of All the Boston Dealer's Displays.

Although the present show is announced as the 11th annual event, this is somewhat in the nature of a misnomer. The first showing of horseless carriages in America was in connection with the Mechanics' fair in Boston in the fall of 1896. There were three

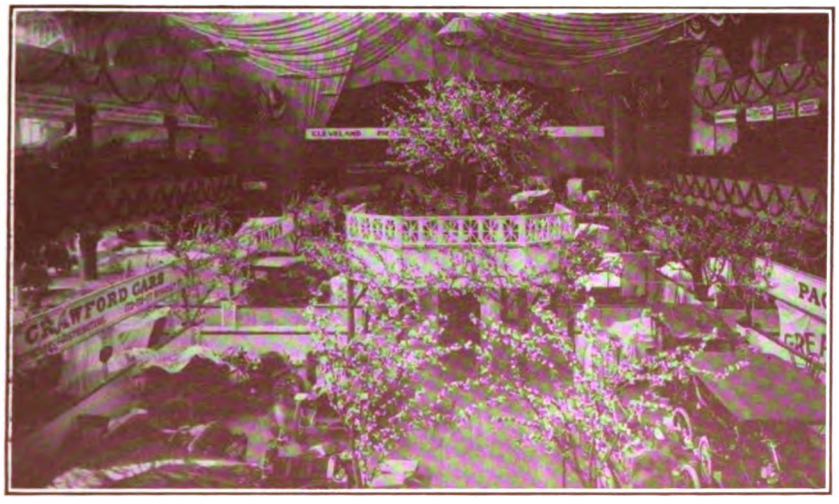
Digitized by Google

Display of Steam, Electric and Gasoline Cars in Symphony Hall, During First Annual Boston Show, March, 1903.

vehicles, one propelled by steam, a second by gasoline and the third an imported tricycle. They formed a portion of the bicycle exhibit in the basement of Mechanics' building. Two years later, for the Mechanics' fair was held only every alternate year, another showing of horseless carriages was made under similar auspices and the number on display was increased to five or six.

It will be remembered that the first showing of automobiles in New York City was in the fall of 1899, this also being held as a section of the annual bicycle exhibition in Madison Square Garden. The following year the first national automobile show was organized and held in that building. There does not appear to have been any Boston automobile show in 1900, but early in 1901 there was an exhibition, more or less private in nature, in Automobile Headquarters on Stanhope street. It was held in connection with the formal opening of this garage by the Underhill Company, then as now, agent for Knox cars. No admission fee was charged.

Perhaps the success of the New York display encouraged the then recently organized Massachusetts Automobile Club to conduct the fourth Boston show in Grand hall, Mechanics' building, in connection with the Mechanics' fair of 1902. At least some of the features of the national display were incorporated in this exhibition, notably the demonstration track and the provision for accessory booths under the balcony, with the cars occupying positions in the centre of the floor.



When these four shows are added to the others which followed the present display becomes the 15th instead of the 11th, and besides antedating the automobile show history of any other city in the country by four years, Boston can lay claim to one more exhibition than any other city. But the 1913 Boston show is the 11th annual display given under the auspices of the dealers in Boston, and therein it is maintained lies the secret of its reputation as biggest and best.

Those who are at all well versed in automobile history are aware of the highly important part that New England has played in the development of the present day motor car. There is little doubt that the early shows did much to encourage the adoption of the newer type of vehicles by the general public, and from the first the Boston show has been a big business producer. The Massachusetts Automobile Club had its own garage on Boylston street as early as 1903, and possibly in 1902, being the first club in America to conduct a garage on practically a co-operative

Simple Decoration of Grand Hall, Mechanics' Building, Boston, for the Third Annual Exhibition in 1905.

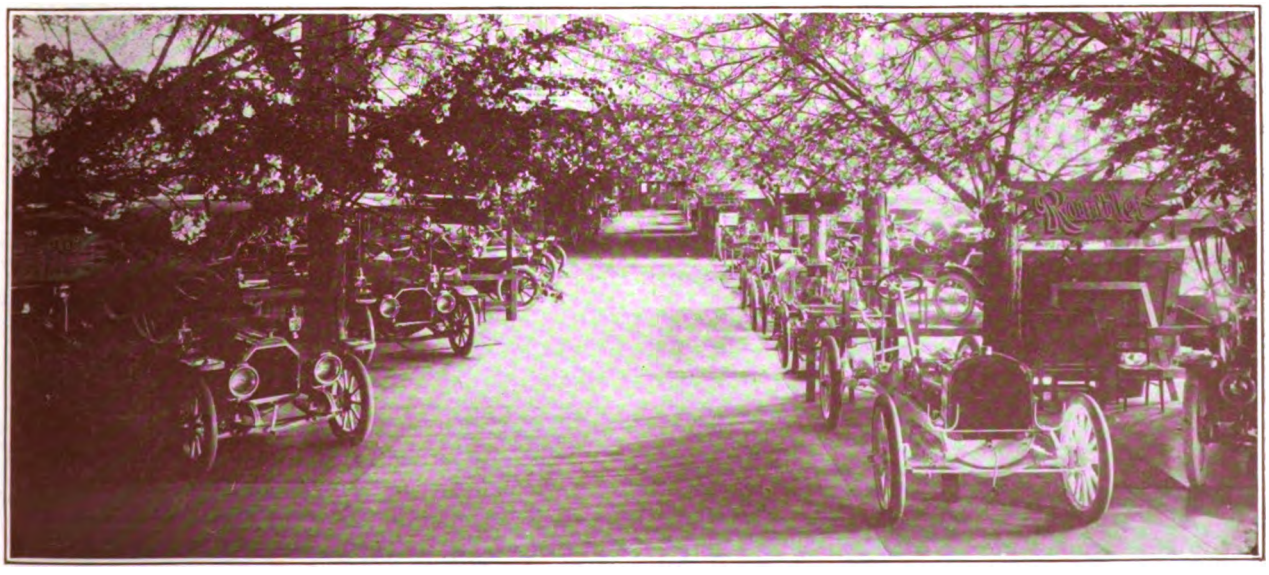
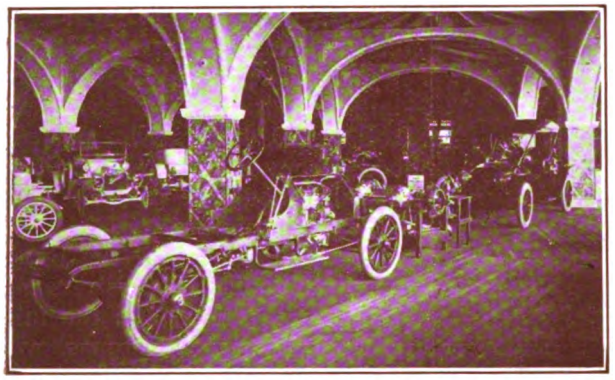
Floral Treatment of Grand Hall, Mechanics' Building, for the Fourth Annual Boston Show in 1906.



basis, thus indicating the early demand created.

By 1903 interest in motor vehicles had reached a point where the dealers of Boston were convinced it was wise to inaugurate further means for their exploitation. Ten of the principal agents deposited $100 with the following committee: W. E. Eldridge, George H. Lowe, Harry Fosdick, J. H. MacAlman and Chester I. Campbell. Mr. Campbell was not a dealer, but had had considerable experience in managing successful bicycle shows in Providence, R. I., and he was selected as the managing member of the committee.

The first annual Boston dealer's show was held for one week in Symphony hall. Twenty-one different makes were shown and the attendance was 17,360. In the absence of a definite statement it may be assumed that the 10 dealers who posted their money as a guarantee that the bills should be paid did not lose by the venture.



The following year the Boston Automobile Dealers' Association was formed and the future policy of the Boston show was decided upon. The first annual display was held in March, because the dealers were convinced that this was the period of the year—just before the opening of the actual driving season—when the public was most likely to become interested in the purchase of cars. The association has steadfastly maintained this position throughout, and the results each year have been such as to justify it.

Mr. Campbell was retained as general manager of the new association, a position he has held ever since. At the second annual show in 1904 manufacturers of motor boats and their accessories were permitted to join with the automobile dealers. The display of motor vehicles was much larger than heretofore, however, and the attendance was over 30,000, this being made up more largely of those who were ready to purchase cars. This was in Mechanics' building, where all subsequent shows have been held.

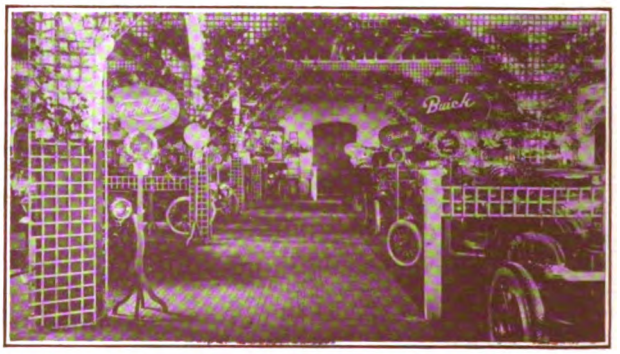
Elaborate Treatment of Exhibition Hall for Seventh Annual Boston Show in 1909.

The number of exhibitors grew rapidly until in 1907, when the total of makes on display was 121, of which six were commercial types. The first national show in New York that year had but 85 different makes, and the second 45, making a total of 130 for the two exhibitions. Chicago had but 96. These facts served to bring the Boston dealer's show into prominence as the biggest of the year, and the decoration scheme—this being the famous apple blossom display—was conceded to be the best ever produced. But above all else was the record of business transacted, and while it is impossible to give an accurate estimate, it was such as to establish the exceptional value of New England as a market for machines.

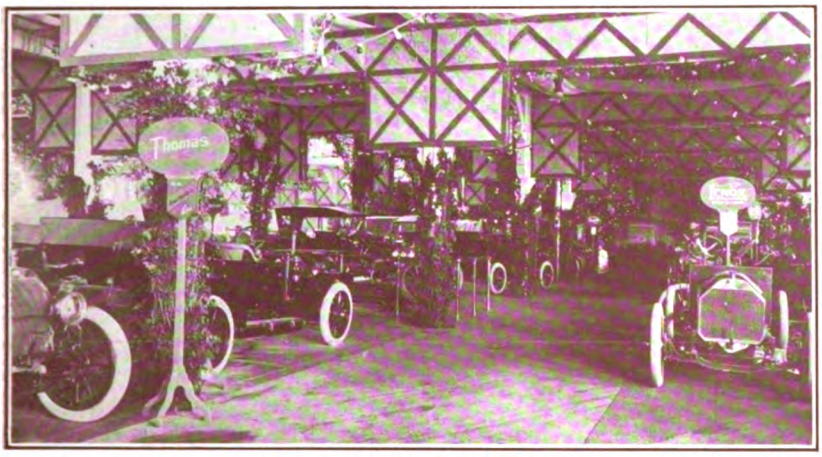


Later in the year the industry passed through one of the most trying periods of its history. Many names appeared on the list of exhibits in 1907 which were not to appear on another similar list. The motor boat section was eliminated in 1908, and while the number of makes on display was reduced to 84, largely because of the financial depression from which the country had emerged but recently, the business transacted was such as to indicate a quick recovery by the purchasing public.

Colonial Setting of Grand Hall During Ninth Annual Boston Show in 1911.

The success of the dealer's show in Boston, even in the face of what appeared to be such unfavorable conditions, resulted in the display of no less than 106 makes in 1909. Of these, 18 were commercial cars. In 1910 there were 122, of which 25 were business vehicles, and again the Boston show was the biggest in the country. In number of completed cars and chassis on display, 650, it exceeded any motor car exhibition that had been held, the previous record being 597 at the Olympia show in London in 1909.

In 1911, both New York and Chicago held separate shows for pleasure cars and trucks. There was some demand for such a division in Boston, but Mr. Campbell and the officers of the association held that conditions were not yet sufficiently developed to warrant a change of policy. The number of exhibitors was such that additional room was secured in Horticultural hall.



Lattice Design as Worked Out in Exhibition Hall for 1911 Display.

The total of makes was 143, of which 41 were commercial. The records revealed an attendance of 146,363. There were 70 makes of pleasure cars and 35 of trucks at the two shows in New York and 94 and 44 respectively in Chicago. Again the Boston dealer's show was the biggest and best of the country.

For some reason there was a feeling among the manufacturers that New England had reached its highest importance as a market for motor vehicles, and in 1912 it was freely predicted that the Boston show would lose some of its prestige. When the doors closed on the pleasure car display the dealers reported they had sold, in round numbers, $2,000,000 worth of automobiles during the week. The attendance had been between 225,000 and 226,000. The Boston Commercial Motor Vehicle Association was organized and took over the business wagon display as a separate show, following that of the first week.

Exhibition Hall Was Characterized as an English Garden During the Tenth Annual Boston Display in 1912.

There were 107 makes of pleasure cars represented in the Boston show of 1912, as against 98 for Chicago and 91 for the two shows in New York.

This year there has been so much discussion of the relative merits of the national and local dealer's show that the Boston Automobile Dealers' Association has felt compelled to establish still further its reputation of biggest and best. The list of exhibitors on subsequent pages reveals a total of 91 makes of pleasure cars, as against 90 in New York and 102 in Chicago. But this list was compiled a week before the opening of the display and it always has been true that a number of makes are added during the last few days. Last year there were no less than 14 added in this manner. At least nine of the cars shown have not been exhibited at the national shows this year, making an added feature of importance.

In the commercial vehicle section there will be 54 different makes, according to the list, but as the show will not open until three days after the close of the pleasure car section, there is time to increase this total very materially. Of the 54, eight have not been shown at a national display this year, and at least four of these have not been exhibited heretofore at any time.

Concerning the accessories and supplies, it must be stated that figures cannot do full justice to the situation. So many manufacturers who make display direct at the national shows are represented in Boston by jobbers that it is safe to say that practically all of the prominent lines seen at the New York and Chicago displays are included in the list, besides a large number of new lines which have not been exhibited previously.

Those who will visit the 11th annual Boston display understand little of the necessary work in organizing, financing and running a trade exhibition devoted to the interests of a single industry. Few men have had as much experience in this line as Chester I. Campbell, and a brief statement from him concerning the methods that have made for the success of the biggest and best Boston show undoubtedly will prove of interest. He outlines the necessary steps as follows:

By success is meant not only the profitableness of the exhibition to the management thereof, but also its value as a business getter and advertising medium to the exhibitors as a whole. Then again, a trade exhibition cannot be made to pay a profit from the gate receipts; indeed, there are few exhibits of any kind that would draw enough receipts during the course of a week, or a month, to meet expenses, and it is the return from exhibit space that makes possible such ventures as automobile shows.

The more successful the show is to the exhibitors as a business getter, the more the management can charge for space; and the greater the receipts from the sale of exhibit space, the greater the possibility of a successful show from all points of view. Therefore, it is plain to be seen that much depends upon the enthusiasm of the general trade in that particular line and upon the willingness of that trade to invest its money liberally with the prospect of pro rata returns in the form of either cash business during the show or advertising value that will follow show results after the show.

Immediately after the results of one show are declared the date for the next annual exhibition is decided

Grand Hall with Its Southern California Mission Setting as Arranged for Tenth Annual Boston Show in 1912.

Digitized by Google

upon. It may be mentioned here that applications for exhibit space are filed in no small number a full year ahead, in order to be assured of precedence in securing a desirable location. The building is then leased and the office force of the management begins to get busy for the next show. This office force is somewhat reduced in summer, yet a certain amount of work is proceeding constantly, and the bookkeeper, manager, press agent, system man and some assistants are kept busy all the year around. Lists of old exhibitors and prospective new exhibitors are compiled, envelopes and circular matter addressed, new printed matter and stationery prepared, etc., in addition to the work of collecting bills and making settlements of the last show, until August or September, when the circulars are sent out and preparations begun for the allotment of space, and a full office force is again kept on the hustle until the following spring.

Old exhibitors are given preference in order of the number of times they have exhibited consecutively at the annual shows, insofar as possible, and former exhibitors also are given first choice for the same location which they have regularly occupied in the past. Then, preference for any special locations is regulated by prior application for that space. It can safely be said that it requires just as much attention and a good deal more good nature and diplomacy to handle an exhibition when demand exceeds supply for exhibit space, as when some effort must be made to dispose of space.

As each allotment is made, card file records, as well as bookkeeping records, are necessary, and the application blanks and all correspondence must be filed so as easily to be available. One must be prepared to find out at a moment's notice when application was filed, or what space so-and-so has been alloted, or who occupies such-and-such location. In the meantime, hundreds of inquiries regarding the show must be answered and lists and partial lists of exhibitors are required for various purposes. It also must be remembered that artists and

architects are working at the same time on decorative ideas and preparing the details in order to be ready for erection in two days' time.

When finally every exhibitor has been alloted his location; has been furnished with all necessary notices and information, and has filed his information blank regarding his exhibit as well as his signed application, contract and deposit, the manager and his office force move bodily, with all necessary effects, to the building where the show is to be held, and where the decorators already have been working for a day or two in preparation for erecting the "scenery."

From two or three days before the opening of the show until two or three days after, the manager and his assistants work from early morning until midnight, and sometimes later. There are complaints to adjust, mistakes to rectify, patrons to satisfy, queries to answer, extra signs to order, carpenter work to be done for some exhibitor, and a thousand other things. The counting and sorting of tickets alone requires four or five smart assistants. However, there is much satisfaction to these competent and untiring routine workers, as well as to the manager himself, in the fact that the more work required the greater must be the amount of business done and the consequent success of the show from every standpoint.

The setting for the 11th annual Boston show is by far the most elaborate yet attempted. Architect E. W. Campbell, brother of the manager, has succeeded in developing a general plan which is expected to meet with decided approval.

Grand hall is particularly pleasing with its realistic scenic effects representing the Hanging Gardens of Babylon, one of the seven wonders of the world. According to the ancient story, the Babylonian king, in order to satisfy the yearnings of his bride, the daughter of the Median king, for the luxurious foliage and tropical scenery of the gardens of her youth, transformed the barren wastes of Babylon about the gilded palace by causing thousands of slaves to erect huge terraces of stone, covered with soil and mould on sheets of lead supported by columns and arches, which enabled him to imitate nature's hills, woods and waterfalls and satisfy his tropically reared wife, Amyris.

The main floor scene is that of a tropical garden with real palm trees 25 feet high from the Bermudas. The balconies form the various terraces, covered with foliage, and the most unique feature of all is the waterfalls on either side, rippling down from the second terrace with foundation pools on the main floor. Glass, electricity and rock foundations lend their aid in producing charming effects in the cascades which spring from shrubbery 60 feet above the floor level.

The stage effects typify the entrance to the palace, or rather a view through the outer portals to the wonderful gardens beyond. The terraced approach to the stage is flanked by the winged and bearded lions of the period represented, while from this viewpoint may best be seen the magnificent painting on the rear wall, entitled, "Nebuchadnezzar's Tribute to His Median Bride," the work of Walter Burrage.

Exhibition hall also is treated as an outdoor setting, the motive being a garden of a century ago. The white picket fences of the forefathers serve as dividing lines for the various exhibition spaces. Old fashioned hollyhocks, honey flowers and blue bells cling to the fences, while the entrance to each separate garden is through a colonial arched portico, over which decorative vines and flowers are entwined.

More attention also has been paid to the basement, which has been found a difficult proposition heretofore. The various spaces are set off with architectural effects representing green marble and thousands of electric lights of various colors help in creating the impression desired. Other departments make use of fireproof foliage from Japan and electrical effects from Germany and France.

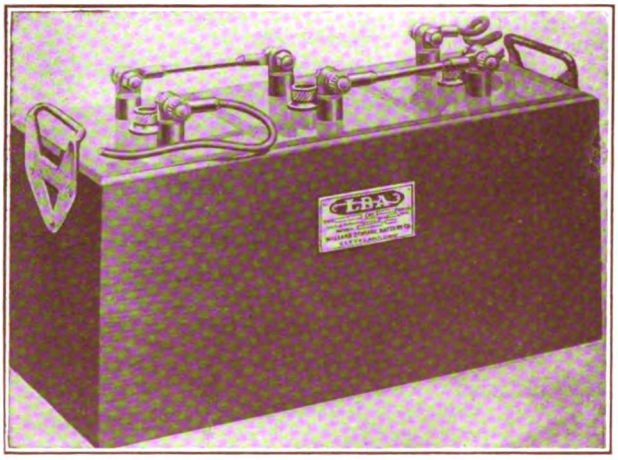
THE FULLY EQUIPPED CAR.

Chas. E. Miller Makes Some Pertinent Suggestions for Benefit of Prospective Purchasers.

According to Chas. E. Miller, 97-103 Reade street, New York City, the well known accessory man, a much more insistent query of the motor car buyer this year than ever before is: "What do I get for my dollars?" Commenting upon this, he says: "The year, therefore, becomes more than ever before the year for the accessory dealer, for, after the buyer has selected the car that suits him in material, design and workmanship, he must next consider the equipment, and this for 1913 consists of speedometers, clocks, windshields, starters, electric lights, tire holders, etc.

"Supposing, for a moment, that the buyer has made a list of the equipment that the car he buys must possess, and if he does, he will find himself up against a difficult proposition. One car may have all these equipment features and another only a part of them. It is just here that the dealer in accessories comes to the front because after the car is bought the selection of extras may be made at the buyer's leisure and convenience that will give him entire satisfaction and allow him to provide the necessities that will be consistent with his idea of a fully equipped car."



An Automobile Trades Association has been organized at Columbus, O. The constitution is modelled after those governing the chapters founded in many of the eastern cities.

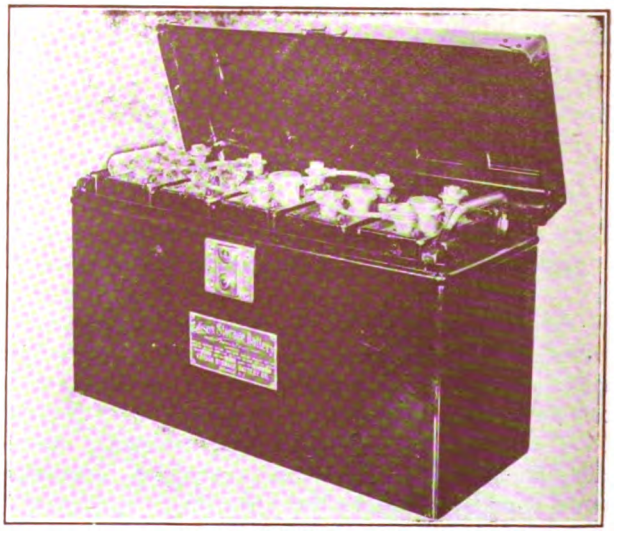
MOTOR STARTING AND LIGHTING BATTERIES.

Why Efficiency Depends Upon Systematic Care---Effects of Improper Charging and Use of Impurities---How to Increase the Life of the Cells.

EFFICIENCY with electric lighting or electric motor starting systems as applied to the automobile, depends wholly upon the storage bat-



LBA Lighting Battery of the Individual Unit Cell Type, Constructed in Various Capacities.

tery. Regardless of the type of equipment, whether it be one in which the generator supplies current to the lamps or the electricity is drawn from the battery, there are periods when the cells are called upon to furnish current not only for lighting and starting, but for signalling, and in some installations for ignition. When it is considered that the electricity derived from storage batteries is due to chemical action and reaction, it follows that the cells must be given proper attention if satisfactory results are to be secured. This holds true of any lighting or motor starting system, even with the equipment including a mechanical generator, the function of which is to charge the cells.

The utilization of storage batteries is not new to the motorist. Before the very general adoption of the magneto they were employed for ignition and these sparking batteries, as they were termed, differed from the lighting units now in use in that they were discharged at a very slow rate. In ignition service they were generally fully discharged and the charging was performed at the battery station or by the expert who had the proper facilities for their care and maintenance. With the lighting and motor starting systems the charging of the cells is accomplished by the generator actuated by the power plant of the car, and the battery is not removed except for repairs or in the event of an accident. The care of the cells, therefore, must be assumed by the motorist or by the battery expert.

Need of Systematic Care.

Regardless of the system, whether it be lighting, motor starting or ignition, systematic care should be given the batteries. Instructions are provided both by the maker of the lighting equipment and of the battery, which are adequate if observed. The advice of those having a smattering of electrical knowledge is not to be preferred to the practical judgment of battery makers' engineers whose instructions are based upon years of experience, and which if followed will result in maximum efficiency. It is not the purpose of the writer to discuss the construction of batteries other than to state that the lead type consists briefly of positive and negative plates, separators, sulphuric acid and hard rubber containing jars. The positive plates comprise supporting and current conducting grids, and active material in the form of red-brown lead peroxide, while the negative plates are similar grids and a peculiar amor-

The Active Material of the Edison Batteries Is Nickel Hydrate and Iron Oxide in an Alkaline Solution.

phous form of metallic lead known as sponge lead. During the discharge a reaction takes place, the plates absorbing sulphuric acid from the elec-

Digitized by Google

trolyte and part of the lead sponge changes to lead sulphate. To secure maximum efficiency from the cells both of the elements must be main-

Exide Lighting, Starting and Ignition Battery, Employing Lead Plates.

tained in good condition with the same charging treatment, because, apparently, treatments which are beneficial to the positive are harmful to the negative, and vice versa. Conditions may be so adjusted, however, as to keep both positive and negative in perfect shape.

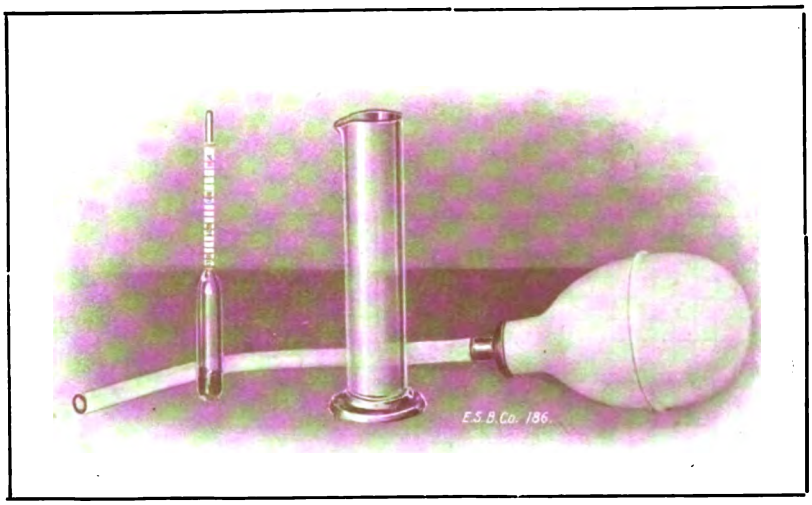
Dealing first with the matter of correct lead storage battery charging, it may be summed up in the one rule—get enough current into the battery and get it in with a minimum of gassing. James M. Skinner, engineer of the Philadelphia Storage Battery Company, Philadelphia, calls attention to this rule in the following discussion of the subject of storage batteries:

Increasing Life of Batteries.

There is no doubt that the general observance of the above rule, particularly the latter part, would increase the average life of lead batteries 20 per cent. or more, but this fact does not seem to be generally appreciated. Much of the improper charging which batteries receive today is harmful, not because the wrong thing is done, but because it is done at the wrong time and in the wrong way. Overcharging and undercharging are good or they are bad, depending only upon when and how they are applied. The first essential toward the betterment of conditions is a thorough understanding of the effects of each, so that they may be used with proper discrimination.

Effect of Undercharging.

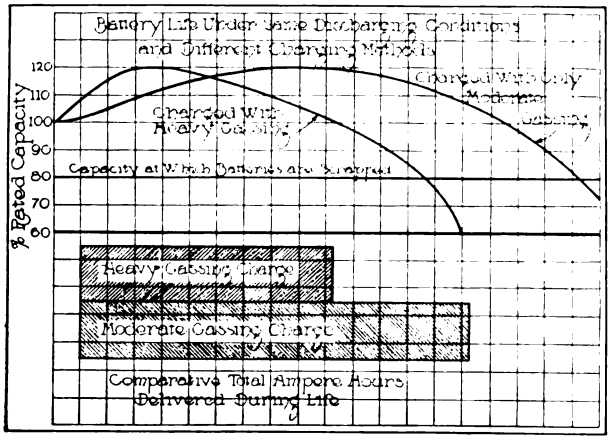
Consider undercharging first. Undercharging to a moderate extent is not detrimental to a battery, and if mixed with proper overcharging is highly beneficial. Details on this point will be given later. On the other hand persistent undercharging with too few overcharges will result in a great deal of trouble. It is very seldom that something can be secured for nothing, and no battery will deliver more power than has been previously supplied to it. If the charges are unduly shortened the capacity will fall off and the battery will develop sulphated plates.



Troubles from undercharging manifest themselves chiefly in the negative plates. When in good condition charged negative plates have a soft, velvety texture, easily indented by the finger nail. This appearance is characteristic of sponge lead. As previously pointed out in the discharge this changes to lead sulphate. Lead sulphate is hard. Consequently a discharged plate feels harder than a charged one. When the battery is recharged the acid comes out of the plates again and the material assumes its velvety texture. If an insufficient amount of current is supplied to the battery some of the hard lead sulphate is not changed back to sponge, but remains upon the plate when the charge is stopped.

If undercharging is persisted in an additional small amount of sulphate is left and the quantity will be augmented with each charge, and will be considerable in time. The sulphate particles are very small when first formed. If allowed to remain in the plate they steadily grow larger, since the solubility of the lead sulphate in the acid is sufficient to permit of their slow, but continual solution and redeposition, during which process the smaller particles, whose solubility is greater because of their greater surface a unit weight, dissolve more quickly and redeposit on the slower dissolving, large particles, causing these to continually increase in size. The larger the particles the harder it is to reduce them back to lead sponge.

Sometimes they grow so large as to be entirely unreducible except by special and time-consuming methods. As long as it remains in the plates this accumulation of lead sulphate subtracts just that much from the active material, and by clogging the pores with a non-conductor, adds just that much obstruction to the passage of the current to the material in good condition. Moreover, being possessed of little cohesion, it is likely to fall from the plate, and perhaps carry with it or loosen some good active material. It should be perfectly evident from this how undercharging, if persisted in, will do great harm to the negative plates.



Benefits of Overcharging.

Regarding overcharging: Every battery needs some overcharging to keep it in good condition. But care should be taken how these overcharges are given. They should not be carried out at a high current rate because of the gassing that accompanies them. Gassing is the greatest factor in wearing out a positive plate. Eliminate or reduce it and the life of the positives shows an incredible increase. As batteries are usually charged a gassing occurs, not only during the overcharge, but at the end of ordinary charges. The passing of the charging current tends to decompose the electrolyte into hydrogen and oxygen. In fact these substances in nascent form do travel toward the electrodes, hydrogen with the current toward the negatives and oxygen in the opposite direction toward the positives. Lead sulphate has the property of absorbing them as they are driven against it. During the early stages of the charge there is an

Electrolyte Testing Outfit, Which May Be Used Instead of the Hydrometer.

Digitized by Google

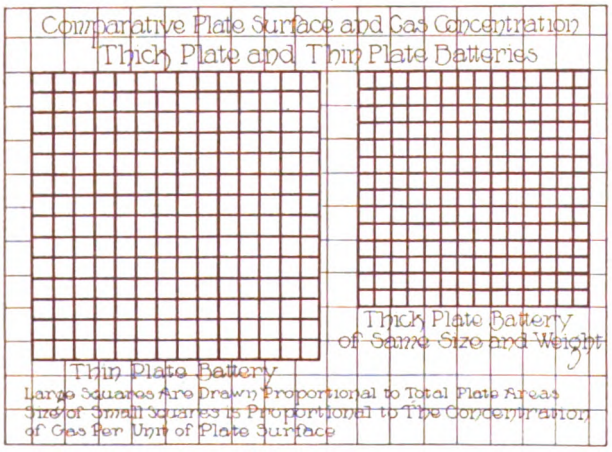
abundance of lead sulphate in the plates and the hydrogen and oxygen react with it as follows:

Positive Plate.

$PbSO^4 + O + H^2O = H^2SO^4 + PbO^2$

Lead Sulphate + Oxygen + Water = Sulphuric Acid + Lead Peroxide

Negative Plate.



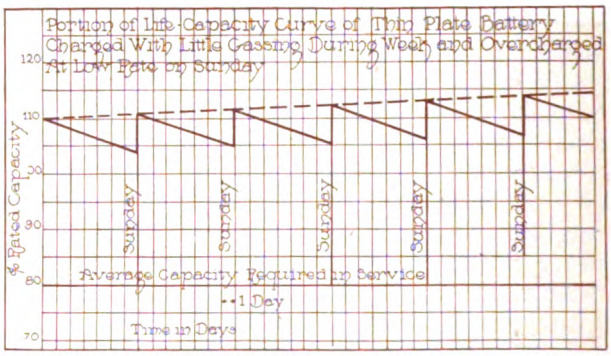
$PbSO^4 + H^2 = H^2SO^4 + Pb$

Lead Sulphate + Hydrogen = Sulphuric Acid + Sponge Lead

As the charge continues the amount of sulphate grows less and less. If the current rate is maintained at its original value the same quantities of hydrogen and oxygen are generated a minute, but with a decreasing amount of sulphate it becomes more and more difficult for them to find material on which to act, until finally the rate of absorption falls below the rate of production. In this case some hydrogen and oxygen pass over into the gaseous form and force their way through the active material into the electrolyte. The longer the charge continues the greater the proportion of current used in generating gas.

Action on Positive Plates.

The hydrogen bubbling out through the negative plate pores is not particularly dangerous. It may dislodge or blister a little material, but sponge lead possesses a high degree of coherence, and is further protected by the flat face of the wood separator pressing against it. It requires pretty hard and continuous gassing to harm a negative by overcharging. On the other hand the lead peroxide of the positive is not so blessed. It possesses comparatively little coherence of its own and heavy gassing is apt to destroy that put in by the battery manufacturer. The face of the active material is constantly washed off, falling to the bottom of the cells as mud, and the whole mass is opened up and softened. In very extreme cases the peroxide becomes of the consistency of mush and of just about as much coherence. Thus the life of a positive plate is directly dependent upon the amount of gassing, and the importance of a systematic charging procedure which will minimize this can hardly be overestimated.

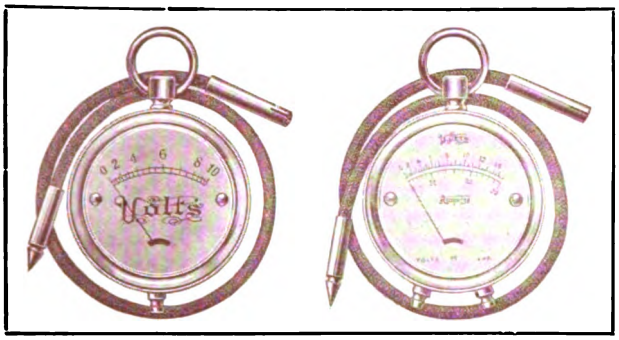


To recapitulate a moment, a battery contains two very dissimilar elements; positive plates, harmed by overcharging, and demanding a minimum of current for long life, and negative plates, suffering from undercharge and requiring plenty of current for good service. Evidently a combination of moderate undercharging on most charges with special care toward keeping the current below the gassing point at all times, and occasional overcharging at a very low current rate, so as to again minimize gassing, will meet the requirements of both. In actual practise the procedure has given remarkable results.

Effect of Tapering Charge.

For example: With a vehicle battery the ordinary daily charge is started at a moderately high current rate, not over the normal six-hour discharge rate, and the current is maintained at this point until towards the end of the charge gassing commences. The rate is then lowered below the gassing point, and the charge continued until the evolution of gas again commences. Tapering the current so as to keep it always below the gassing point is continued until a very low figure, about one-tenth of the normal six-hour discharge rate, is reached. At this point the charge is usually stopped, although there is no danger in continuing this low rate for a few hours more. After a very long and thorough discharge it may indeed be a good thing.

An ampere-hour meter may be used to advantage in connection with this charging method since a few experiments will determine points on the scale at which



the current should be reduced to certain values. As to the total charge ampere-hours necessary, 105 per cent. of the discharge will be sufficient, although this figure should be varied somewhat according to the character of the previous discharge. For a very short discharge it may be necessary to put back only 100 per cent. of the ampere-hours taken out; for an ordinary discharge, 105 per cent. is about right, while for a very long and thorough discharge 110 per cent. may be necessary. Such details are easily worked out when a given set of conditions is at hand. If an ampere-hour meter is not in use, it is possible to determine the voltages at which gassing commences with various current rates, and to reduce the current to the next lower figure as the battery voltage rises to each of these predetermined points. Temperature and age of the battery have, of course, a slight effect on the voltage figures. Better still, the battery may be watched, and the proper reductions of current made when gassing begins.

Small Battery Losses.

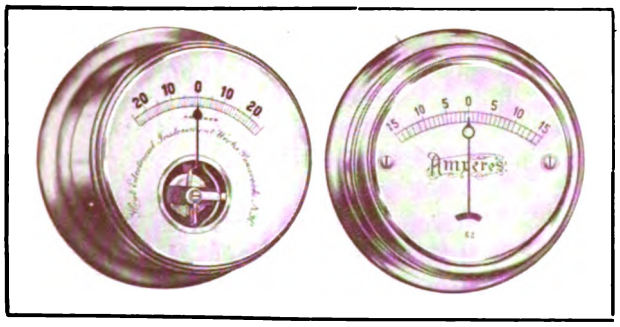
It is well worth while to consider how to eliminate losses even of the small battery such as is utilized in connection with lighting and motor starting with automobiles. These are the result of local action, a rather broad term covering several kinds of internal and therefore wasteful discharge. Local action may be divided into three very general classes: Mechanical, chemical and electro-chemical. The three types will be considered separately.

Mechanical local action has no part in the normal working of a battery. It is the result of short circuit between negative and positive plates in a cell. In rare cases this results from poor lead burning, a "run-down"

Digitized by Google

Hoyt Pocket Type Instruments: At Left, Voltmeter; at Right, Combined Ammeter and Voltmeter.

from the positive group touching the negative group or vice versa. This, however, is the result of inexcusable carelessness, since a simple inspection of the groups after burning and assembling is sure to reveal it. A short circuit from a piece of lead dropped into a cell is in the same category. In some batteries short circuits occur, due to growth of the negative active material over the tops of the negative plates until it touches the lead apron separator hold-down on the positive group or bridges over the separator tops onto the adjacent positive plates. In cases where a battery is abused by overheating trouble is sometimes experienced with the wood separators. These when properly used generally last the whole life of the battery, due to a proper preliminary treatment.



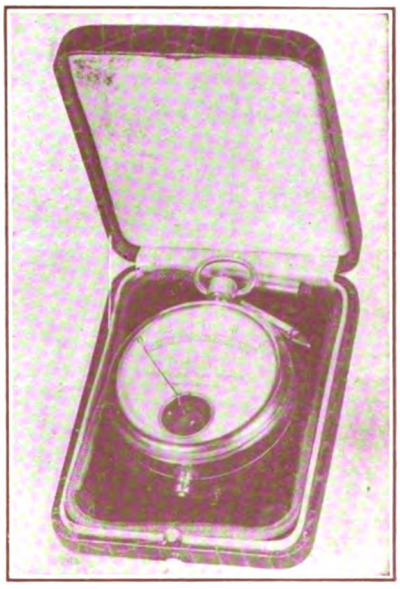
Chemical Local Action.

Under the head of chemical local action will be considered here the effect of too strong sulphuric acid upon the capacity of the battery. A battery nominally discharges by absorbing acid from the electrolyte, forming lead sulphate in the plates, and delivering over the external circuit an amount of current proportional to the amount of lead sulphate formed. In order that lead sulphate shall not form without the production of current the specific gravity of the electrolyte is limited to a maximum of 1.300 at full charge; 1.300 electrolyte contains about 40 per cent. of sulphuric acid.

If the electrolyte contains more than 40 per cent. of sulphuric acid, that is, if its specific gravity is above 1.300, it will attack the negative plate, forming lead sulphate from the sponge lead, but in this case without the production of current. In other words the battery discharges without doing any useful work. Moreover, the strong acid is detrimental to the wood separators, and the lead sulphate formed is sometimes hard to reduce back to sponge lead.

Danger of Using Acid.

The precaution against any such trouble is exceedingly simple—merely be sure never to add acid to a battery under normal conditions. It is never safe to add acid to a storage battery except upon the advice of a competent expert. No acid is ever lost during the normal working of a battery. The acid which was put in it when it was new is used over and over again. On each discharge it is absorbed by the plates; on each charge it is returned by the plates to the electrolyte. Unless some is spilled out it is sufficient, without any replenishing, to serve during the whole life of the battery. After the battery has been charged several times it may seem as if acid has been lost, because the electrolyte level gradually falls. This fall is due to the loss of water by gassing and by natural evaporation, not to the loss of acid, and it should be compensated for by adding distilled water only, whenever the hydrometer readings show that by the increased density of the electrolyte such addition is necessary.



Types 22 and 1 F Hoyt Ammeters Utilized in Connection with Lighting Systems on Automobiles.

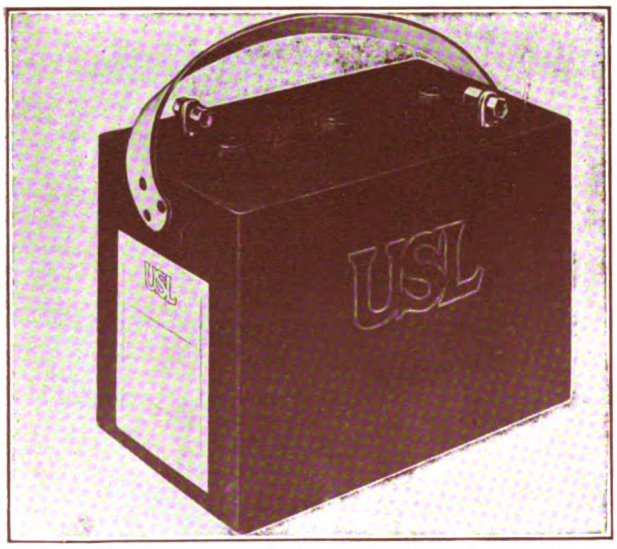
Electro-chemical local action results from impurities in the electolyte. Such impurities may be acids other than sulphuric acid, or metals other than lead. Neither has any place in a normal battery. Acid trouble is rather infrequent except through the introduction of hydrochloric acid in the form of common salt or salt water. If it will just be remembered that salt and salt water should not be allowed to get into a battery, the subject of acid impurities may be dismissed.

Metallic Impurities.

Metallic impurities are more common, but just as easy to avoid. They are of two classes. Some, such as iron, can exist in the electrolyte in two states of oxidation, and, by travelling between the positive and negative plates, being oxidized to the higher state of oxidation by the former and reduced again to the lower state of oxidation by the latter, can cause the formation of lead sulphate and consequent useless discharge of both positive and negative plates. A small amount of iron, given enough time to travel back and forth and to oxidize and reduce, can completely discharge the battery.

New Hoyt Pocket Voltmeter of the Coil Type, Designed for Accurate Reading of Storage Batteries.

Other metals such as copper and platinum are not so active in travelling between positive and negative plates, but confine their attention more to discharging the negatives. As a battery cannot work with discharged negative plates, this is almost as bad as discharging both plates. During charge the impurities deposit on the negative plates in the metallic state. When the charge is stopped the deposited impurity forms with the sponge lead a little internal primary battery. A complete circuit being made by the conducting sponge lead, this little cell starts immediately to discharge. The copper (or other metal) dissolves and lead sulphate is formed in the sponge lead just as during a normal discharge of the battery, although in this case as in other cases of local action cited, no useful work is performed.



Reliable battery makers are extremely careful to use nothing but the purest materials in the manufacture of their batteries. The companies maintain extensive laboratories and employ trained chemists to do nothing but constantly supervise the purity of all materials entering into the construction of their batteries. They are absolutely sure that when a battery leaves their hands it is free from impurities as it is possible to make it. To keep it in this condition it is necessary to observe practically only one simple precaution—use only distilled water for maintaining the electrolyte level one-half inch over the plates.

Inspection of Battery.

Relative to the inspection of the cells, the Willard Storage Battery Company, Cleveland, O., maker of the LBA batteries, advises the examination of each cell at least once a week in the summer and once every two weeks in the winter, replacing lost solution with distilled water only. Acid should never be added except under conditions previously pointed out and it is best to secure the electrolyte from the nearest service station of the maker. This will insure against impurities.

Specific gravity readings should be taken at the time of the inspection, and before water is added, especially where the cells are charged by the generator on the car as the readings will check the performance of the dynamo, indicating

Type of Battery Employed with United States Light & Heating Company's Lighting and Starting System.

whether the machine is performing properly and is keeping the cells fully charged. The specific gravity is taken with a hydrometer syringe or the testing equipment illustrated herewith. These instruments may be secured from the maker of the battery and are not expensive. The Willard Storage Battery Company advises the use of a low-reading voltmeter in conjunction with the hydrometer, stating that the former shows the electrical pressure at the time of reading and only partially indicates chemical conditions. The hydrometer is the more reliable source of information.

Specific Gravity.

When the battery is fully charged the specific gravity should read between 1.280 and 1.300 as indicated on the hydrometer, and it should be approximately the same in all cells. In charging, the temperature of the electrolyte should never be allowed to rise to a point higher than 100 degrees Fahrenheit. The rise in temperature is usually due to the rate at which the cells are being charged. The lower the rate the lower the temperature of the battery for the same room temperature. Low temperatures are in no way injurious to the cells, but they have the effect of temporarily reducing the battery's discharge capacity. This is noticeable in cold weather when the capacity is reduced in proportion to the temperature and at zero, Fahrenheit, the loss in capacity is about 50 per cent. A return to normal temperature, however, restores the capacity. For the benefit of those not familiar with batteries it is stated that they should never be discharged below the point of exhaustion—1.80 volts a cell when the current is flowing. Thus with a three cell the voltage should not be allowed to fall below 5.40 volts.

Care of Cells and Containers.

In charging a battery removed from the car care should be taken to remove the vent plugs and to see that the vent holes of these members are free when they are replaced. The top and sides of the case should be wiped until dry and if moisture be present, due to the acid, apply a solution of bicarbonate of soda (cooking soda) and water to neutralize the acid, then wipe the case with a cloth dampened with water, and when dry rub down with linseed oil. Another method is to employ a piece of waste dipped in ammonia for removing the acid.

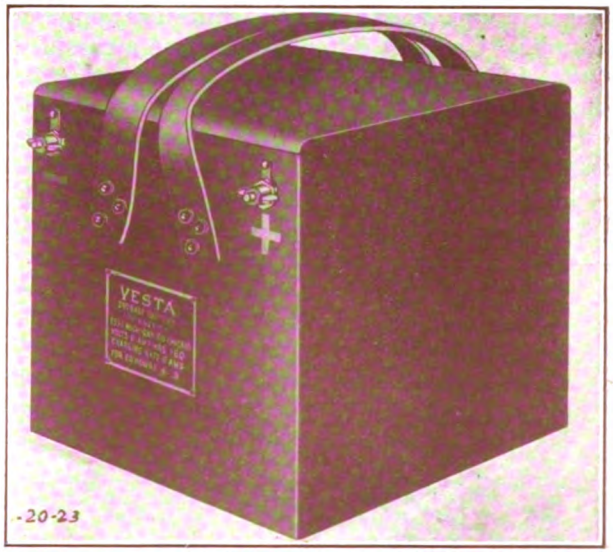
Regardless of the method of charging the battery, whether it be by the generator on the automobile, by lamps on a direct circuit, through a rheostat, or by an alternating current with a rectifier, the rates advised by the maker as well as his instructions, should be followed to the very letter. By fulfilling these conditions maximum efficiency will be secured and economy effected. The very general establishment of service stations by the leading battery manufacturers enables the motorist to secure equipment essential to the upkeep of the cells and provides a place where the batteries may be properly cared for at a minimum of expense when they are not to be used for a considerable period.

Care of Edison Batteries.

The Edison batteries, made by the Edison Storage Battery Company, Orange, N. J., differ from those previously described in that the active material of the positive plates is a nickel oxide in perforated steel tubes reinforced by eight

Digitized by Google

steel bands, equidistantly spaced. The tubes are flanged at both ends and held in contact with a steel supporting grid. The negative active material is iron oxide tightly packed into perforated steel pockets, these being inserted in a grid and subjected to great pressure between dies which corrugate the surface of the pockets and force them into practically integral contact with the grid. The jar or container is of cold rolled sheet steel with seams welded by the autogenous process and the protective coating of nickel is fused into the metal.



The electrolyte is a 21 per cent. solution of caustic potash in distilled water with a small quantity of lithium. Charges or discharges have no effect upon the density of the electrolyte and the condition of the cells may be ascertained fairly accurately with a voltmeter. The battery may be overcharged without injury and given boosting charges, as well as discharged at high rates. One of its qualities is that it may be left for a considerable period in a discharged condition without impairing its efficiency and is restored to its normal capacity by charging and discharging. After 250 charges and discharges the electrolyte should be renewed. It requires no other attention than the addition of distilled water in sufficient volume to keep the plates submerged.

Measuring Instruments.

Accurate reading instruments are essential in the upkeep of storage batteries. In testing the cells an ammeter is not practical on account of the exceedingly low resistance of the circuit which would cause rapid discharge of the battery and injury. In addition an ammeter connected across the terminals would not serve any useful purpose. When the cells are being charged a chemical action is set up which increases the pressure or potential between the positive and negative plates. As long as this circuit is open this pressure continues, but as soon as a circuit is made between the two elements chemical action takes place in an opposite direction, reducing the pressure or difference of potential between the two plates. For this reason it is customary to utilize a voltmeter having high resistance and requiring practically no current to operate it. Very often a condition exists in a battery that will cause it to maintain its voltage when idle, but this voltage will drop instantly when the cells are in service. Therefore it is more satisfactory to test a battery with a voltmeter when performing its work.

The Hoyt Electrical Instrument Works, Penacook, N. H., maker of current indicating devices, announces the perfection of a pocket voltmeter of the coil type which the company holds is superior to the conventional type which has an iron moving element. With the latter type there is considerable heating error, and the range between a fully and partially charged battery is so slight that the indication of such an instrument is misleading. The new meter averages about 40 ohms a volt, is dead beat in action, is slightly larger than a watch and is moderately priced.

An ammeter is utilized for showing the rate at which the battery is being charged or the amount of current that is being drawn from it. It is connected in series in the circuit, usually close to the battery and between the latter and the dynamo. One of the leads to which the load is connected is usually tapped off from this wire

The Vesta Lighting Batteries Are Constructed with Different Voltages and Capacities.

between the ammeter and the dynamo so that when the latter is charging the battery the ammeter reads in one direction marked "Charge." When the battery is supplying current for the load the instrument reads in the opposite direction marked "Discharge." The various instruments, including those employed in testing batteries as well as those utilized in connection with lighting systems, are illustrated herein.

The Atlanta Automobile & Accessory Association has appointed a committee to co-operate with a similar committee of the Jacksonville Automobile Club in promoting a run from Jacksonville, Fla., to Atlanta, Ga., in April.

A STARTING SUGGESTION.

Various methods are employed for starting a cold motor such as priming the cylinders or intake manifold, flooding the carburetor, applying heat, etc. One that differs from those mentioned is that followed by a reader of The Automobile Journal and the device is depicted in an accompanying illustration. It is inexpensive and is installed easily.

The principle involved is that of priming or flooding the carburetor with a high test gasoline,

A Suggestion for Priming the Carburetor for Starting a Cold Motor.

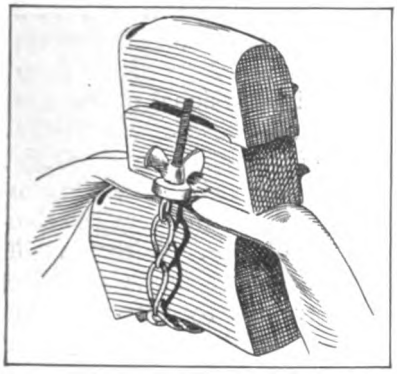
but the user of the system states that he employs a mixture of sulphuric ether and ordinary motor fuel, using about 25 per cent. of the latter. The mixture being considerably lighter than the fuel in the carburetor it rises to the top, and flooding the vaporizer produces a condition similar to that obtained by priming, or "tickling" the float. Being highly volatile the fluid vaporizes easily.

As will be noted by the drawing a small container, holding about a quart, is secured to the inside of the dash and a pipe is led to the top of the float chamber. Inserted in the line and near the carburetor is a petcock. In installing the float chamber is drilled and then tapped to take an elbow, the pipe connected and petcock attached. The container should be provided with a filler cap which should have a small air vent.

To utilize the device the petcock is opened for a brief period and the carburetor flooded with the mixture. The inventor states that he has been very successful in starting his motor on the coldest of mornings and that it is an easy matter to determine when the float chamber is flooded by the dripping of the fluid as when priming in the usual manner. As outlined it is necessary to raise the hood, but this could be eliminated by placing the petcock on the driver's side of the dash if desired.

CARE OF TIRE CHAINS.

It is an excellent plan to examine the tire chains from time to time and note the condition of the cross links. These members will wear, especially when employed in city driving. Links worn thin should be replaced with new members. Never drive with the chains so loose that they strike the fenders. They not only injure the mudguards, but the shoes are likely to become damaged. After removing the chains from the wheels they should be cleaned and allowed to dry before being replaced in the bag.



GRAPHITING THE RIMS.

Tire rims require more attention in the winter and spring than during the summer as the thoroughfares are more or less wet and the rims are subjected to moisture. The tires should be removed from the rims and the latter cleaned, then covered with a mixture of graphite and oil. This will also prevent the entrance of water.

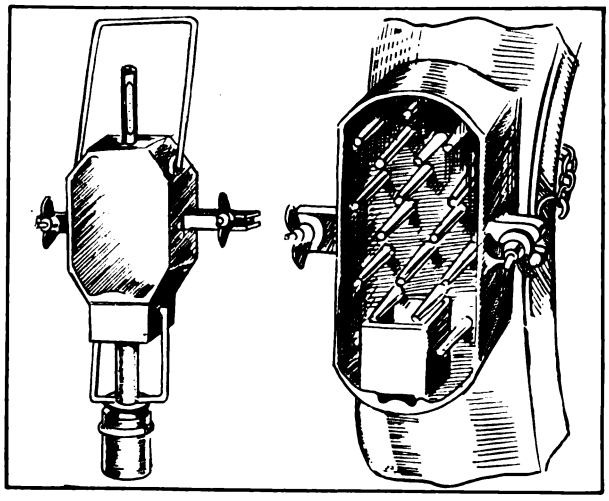
VULCANIZING INNER TUBES AND TIRES.

VULCANIZING inner tubes and even shoes is now being taken up by many motorists who formerly relied upon the tire expert for work of this nature. The marketing of a large number of vulcanizers which automatically perform the repair and with a minimum of attention, has led many to undertake the maintenance of both tires and tubes. Aside from the matter of convenience, making it possible as it does for the owner to obtain his work promptly, a considerable economy is effected. When it is considered that it costs about 50 cents to have a fair sized puncture vulcanized and the motorist is obliged to make two trips to secure the tube, the home or garage outfit is an attractive proposition.

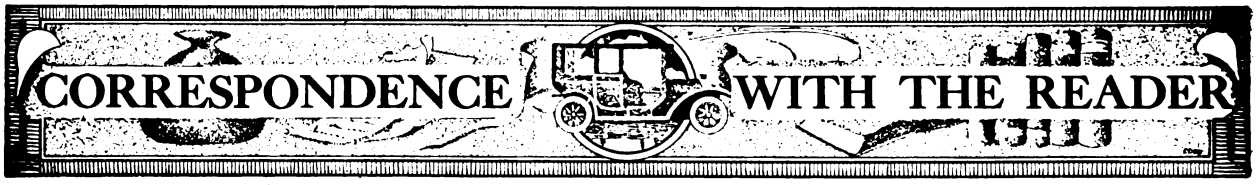
McVey Vulcanizer Using Gasoline.



From the economical point of view a suitable vulcanizing outfit is a good investment. Punctured inner tubes cannot be used until repaired, but it is not so with cut or damaged casings. Frequently an owner will note a cut in the tread, but will avoid carrying the tire down street to the repair shop, especially when obliged to use a trolley car. With the garage outfit it is a simple matter to vulcanize the cut and some vulcanizers are constructed so that the work may be performed without removing the casing from the wheel.

The cost of a vulcanizing outfit varies from a few dollars to as high as $25 or more, but a serviceable one may be secured for about $5. The most inexpensive members are adaptable for repairing inner tubes. Gasoline is utilized as a fuel and the heat is regulated by the construction of the vulcanizer itself. One of this type is the McVey, shown in an accompanying illustration and produced by the McVey Manufacturing Company, Dayton, O. It is filled with an ounce of gasoline which when ignited by a match will burn out and retain sufficient heat to vulcanize properly. The outfit is very compact, may be carried in the tool box, and comprises in addition to the vulcanizer, cement, rubber, scissors, etc.

The Mascot vulcanizer, also illustrated, operates on a similar principle, and is adaptable to both inner tubes and casings. The work is performed automatically and the device is provided with a chain and clamps for securing it to the shoe, which need not be removed from the wheel. The outfit is very complete, comprising a roll of rubber, cement, sandpaper, shears, etc.



The National Motor Supply Company, Cleveland, O., maker of the Mascot, also produces the National portable steam vulcanizer, which comprises a hollow metal body partly filled with water and sealed. It is heated by a wood alcohol lamp with an adjustable burner and the device operates on the same principle as the large steam vulcanizers. A thermometer enables one to note the temperature. It is stated that it requires but a few minutes to develop steam. Two vulcanizing surfaces are provided, one curved for casings and the other flat, for tubes. It is moderately priced.

With any equipment the maker supplies explicit instructions as to its operation and several illustrate the various processes of repairing casings. With a moderately priced outfit one could overhaul and place the tires and tubes in first class condition at a slight cost. With a large outfit, such as is designed for the private garage, one could easily pay for the outfit in a short time by doing repair work for motorists in the neighborhood. Instructive data upon tire repairing are furnished free of charge upon application by the makers of vulcanizing outfits.

National Portable Steam and Mascot Vulcanizers, Adapted for Owners Who Make Tire Repairs.

Flexible Couplings.

(1493)—I noted in your issue of Jan. 25th mention of flexible couplings employed on several cars to drive the magneto. Am contemplating installing a magneto, driving it from an extension shaft and mounting it on a bracket or frame. Was told by a repairman that it would be necessary to have both shafts line up perfectly and that it was a job that could not be done other than by an expert. Could I not employ a flexible coupling and what type would you advise? INFORMATION.

Danbury, Conn., Feb. 25.

The flexible couplings referred to were of the leather type and constructed by the car makers. Announcement is made by the Bosch Magneto Company, New York City, of a new adjustable flexible coupling which would be adaptable to drive a magneto installed as mentioned.

The device, which is shown assembled at Fig. 1, permits the driven unit to operate both out of centre and out of line, eliminating the need for exact alignment of the magneto and driving shaft as mentioned by the repairman. Another advantage of the Bosch device is that the magneto may be displaced without disturbing the timing or any part of the driving mechanism.

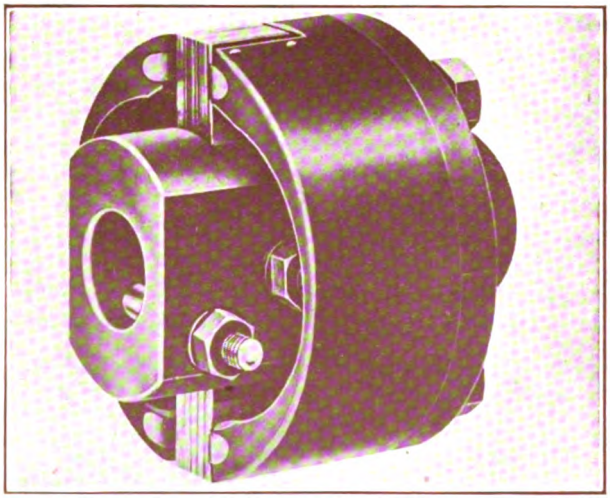

Fig. 1—Bosch Adjustable Flexible Coupling Permitting Driven Unit to Operate Out of Centre or Line, and Change of Timing Without Removing Magneto.

The Bosch coupling comprises a cone shaped piece of steel attached to the armature shaft and terminating in a ring having diametrical fibre lined slots. To the driving shaft is secured a flange that carries a flat crossbar consisting of a large number of fine spring steel leaves or plates. The crossbar fits in the slots or recesses of the cone shaped member, as is shown at Fig. 2.

The laminated crossbar has a marked spring action and permits the two members of the coupling to have a slight relative torsional movement, which is ample to absorb the shock of varying resistance to the rotation of the magneto armature. The spring crossbar also has a slight bending or twisting movement sideways, permitting the two shafts to be slightly out of line. With a rigid coupling the driving and driven shafts must be aligned, and the shock created by the magnetic resistance is transmitted to the driving gears, producing noise. Noisy action is eliminated in the Bosch spring crossbar and ring by lining the cavities with fibre, which in addition, obviates the necessity for lubrication.

The cone shaped member of the coupling is made with proper tapers for various types of Bosch magnetos, a recess being provided for the armature nut. This section is keyed to the armature shaft, while the other member of the coupling may be attached to the driving shaft by a key or the bolt which accompanies the coupling.

Where the adjustable flexible coupling differs particularly from the usual flexible coupling is in the construction of the cone shaped member. In the adjustable type this is made in two parts instead of one, the portion engaging the driving member having a circular groove carrying three bolts with tapered heads, as is shown at Fig. 2, which depicts the disassembled coupling.

The portion which is actually secured to the armature shaft is an ordinary flange having three holes in which the taper headed bolts register. When the nuts on these bolts are set up tight there can be no relative motion between the two portions, due to the binding effect of the taper; so that the sections become as one. Upon loosening the nuts, the magneto armature, together with its portion of the coupling, can be rotated through a complete circle.

A vernier engraved on the stationary portion permits accurate regulation to any degree and on this account the magneto may be mounted on the motor without reference to the timing and the armature set in any position after the entire apparatus is fixed. The construction permits of tests being made to secure the best results from timing without changing keyways, cotter pins,

Digitized by Google

etc.; or in other words, the position of the armature may be altered slightly after installing the magneto, a condition not possible with rigid couplings without considerable labor.

Ford Transmissions.

(1494)—Can you inform me if the Ford Motor Company ever fitted a transmission other than the planetary to its cars? FORD OWNER.
Cleveland, O., Feb. 26.

The Ford Motor Company always has installed the planetary type of transmission on its cars.

Imperial and U. S. Gallon.

(1495)—I note that the price of gasoline is much higher in England than it is in this country, but I have been informed that a British gallon is larger than the American. If so, what is the difference? AMERICAN.
Little Compton, R. I., March 1.

The Imperial or British gallon is larger than that in use in the United States. The former contains 277.274 cubic inches while the latter is given as 231.

The British Imperial gallon is usually defined as being equal to 277.274 cubic inches, or 10 pounds of pure water at the temperature of 62 degrees Fahrenheit and barometer at 30 inches.

The Metric System.

(1496)—In some of the descriptions of foreign motors in your book you give the bore and stroke in millimeters. How do you convert these to inches in our measurement? W. D. T.
Pittsburg, Penn., March 2.

The metric system of measurement is utilized abroad. The fundamental unit of it is the meter, the unit of length. From this the units of mass (gram) and capacity (liter) are derived. All other units are the decimal sub-divisions or multiples of these. These three units are simply related, so that for all practical purposes the volume of one kilogram of water (one liter) is equal to one cubic decimeter.

The millimeter may be converted into inches by multiplying by .03937. Conversion tables are printed in a number of hand books and were published in these columns some time ago.

Renovating Timer.

(1497)—The timer on my car is so worn that the roller jumps and causes the engine to skip. The bearings of the timer are adjustable and although I have taken up all lost motion the skipping continues. The repairman advises me to purchase a new timer. Cannot the present one be repaired? I note you answer similar questions from time to time and would like to have your advice. SUBSCRIBER.
Stonington, Conn., Feb. 25.

If the bearings of the timer are in good condition as stated it will not be necessary to secure a new one provided the commutator is fitted with a fibre or some similar insulating substance. This material, in which the contact blocks are imbedded, can be trued up in a lathe and any good machinist can perform the work, which will not be expensive. The skipping mentioned is caused by the roller jumping the blocks.

Parts for Parry Car.

(1498)—Kindly forward me the address of the company having parts for the Parry car, also name of maker of brass tubing and light brass cast T's and L's such as used on intake manifolds. F. S. R.
Northampton, Mass., March 4.

Try the Motor Car Manufacturing Company, Indianapolis, Ind., for parts for a Parry car.

Brass tubing is produced by the following concerns: Bridgeport Brass Company, Bridgeport, Conn.; Waterbury Manufacturing Company, Waterbury, Conn.; Coe Brass Manufacturing Company, Torrington, Conn.; Buffalo Tube Company, Buffalo, N. Y.; Ivins Tube

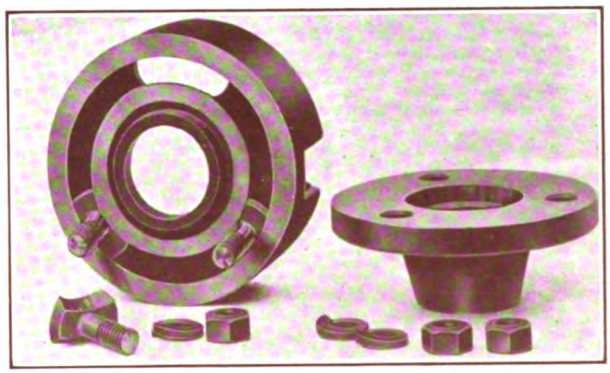

Fig. 2—Showing Components of Bosch Coupling, Including Cone Member, Flange, Crossbar and Bolts.

Works, Lane Station, Philadelphia, and Rome Brass & Copper Company, Rome, N. Y.

Intake and exhaust manifold makers, and manufacturers of castings comprise the Imperial Brass Manufacturing Company, Chicago; the A-Z Company, 530 West 56th street, New York City; Fowler Brass Works, Chicago; Fort Hill Bronze Manufacturing Company, West Everett, Mass., and the Millett Brass Company, Springfield, Mass.

Bore-Stroke Ratios.

(1499)—Availing myself of the privilege of your correspondence column I would be pleased to have you explain what is meant by the bore to stroke ratios. READER.
Hoboken, N. J., March 3.

By the term bore-stroke ratio is meant the relation of the bore or diameter of the cylinder, in inches, to the stroke of the piston in inches, with the bore considered as one. It is found by dividing the stroke by the bore.

THE BOSTON SHOW.

In many respects the annual exhibition of the Boston Automobile Dealers' Association has proven a satisfactory indicator of the interest in the motor car industry, particularly in the matter of sales. General Manager Campbell is firmly of the opinion that the uniform success of this display has been due in no small measure to the fact that it is held at a time when the buying public is ready to make up its mind. The opening of the actual driving season is not far distant, and the enthusiasm created by the show becomes a valuable stimulant for business.

The present discussion of the show situation offers an opportunity for those directly interested in holding exhibitions of this character to study the effect of this plan upon conditions in their immediate vicinity. It will be admitted, of course, that the demand for business stimulation varies according to the section of the country. So far as Boston is concerned the dates appear to have been selected wisely.

Since the Boston show always has been a dealer's proposition, it follows that its wonderful success from every standpoint must redound to the credit of the dealers. Mr. Campbell has a proper right to reserve a generous portion for himself, but the fact remains that he has had the liberal support of the association for which he has acted.

Concerning the forthcoming show: There is every reason to predict another splendid success. The evidences presented at practically every local display throughout the country, albeit there have been many more this year than heretofore, are such as to indicate that the interest in automobiles and motoring is by no means a thing of the past. That the Boston show as an exhibition will be bigger and better than ever before is set forth in the advance announcement. There appears to be every reason for believing that this will hold true of the attendance and sales as well.

CONCERNING REGISTRATION FEES.

A special commission in New York State has been investigating the possibilities for securing some $6,000,000 in additional revenue by indirect taxation. This committee has found, among other things, that "while upward of 107,000 cars and 46,000 chauffeurs were licensed last year, the sum total received in the automobile bureau was but a little more than $1,000,000." It is not difficult for the average motorist to forecast the recommendation under such circumstances.

The committee would double the present registration fees, and makes the following interesting comment: "The increase of fees suggested is readily accomplished by an amendment to that sub-division of that section of the highway law which alone bears upon that subject."

Unfortunately, this plan of raising additional money by taxing the automobile owner is too readily accomplished. Recently, when the Minnesota legislature sought to raise additional money by this means, attorneys representing organized motorists were able to convince the committee in charge that a license tax greatly in excess of the cost of issuing the same would be unconstitutional. Perhaps the Minnesota constitution differs in this respect.

Rhode Island is considering the advisability of a universal lighting law, and it would appear that the bill is likely to be passed in the near future.

THE AUTOMOBILE SHOW SITUATION.

Additional Opinions from Exhibition Managers, and Manufacturers of Cars and Accessories Concerning Relative Merits of National and Local Displays.

FEW men have been more closely identified with the management of automobile shows than Chester I. Campbell of Boston. He has had direct personal charge of all of the exhibitions in that city under the auspices of the Boston Automobile Dealers' Association, and of the dealers before that organization was perfected. Inasmuch as the Boston show, although at all times a dealer's proposition, has been conceded to be the biggest and best business exhibition of the year, his opinion with reference to the present discussion of national and local displays, and their respective merits, will prove of interest.

Mr. Campbell's letter, and those which follow it, comprise a continuation of the opinions expressed by motor car and accessory manufacturers and others in the last issue. They were received in response to a request directed to the exhibitors at the New York and Chicago national displays and the managers of all the principal shows in the country for a statement with reference to the letter sent to automobile makers by Albert L. Pope, president of the Pope Manufacturing Company, Hartford, Conn., suggesting the abandonment of national shows in the future, and the announcement of Chas. E. Miller, 97-103 Reade street, New York City, pioneer accessory dealer, favoring the substitution of local dealer's shows for the national events in these two cities.

Why Campbell Favors Local Shows.

Your letter of recent date in reference to the letter forwarded to the motor car manufacturers by Albert L. Pope, wherein he suggests the abandonment of the national shows at New York and Chicago, is at hand. It occurs to the writer that the attitude of Mr. Pope, and many of the other manufacturers, towards the national show situation has brought to light a detail of the show business which is little known and which is of vital importance.

The manufacturers for some 12 years past have held their annual shows at New York and Chicago. In the early years of the same it served as a meeting place for their agents, at which time these agents would "sign up" for another year and study the general make-up of the cars which they were to handle, as well as make comparisons with various other makes on exhibition. It also gave the manufacturers the opportunity of appointing new agents in unoccupied territory. At these earlier shows each agent had his best salesmen there and many sales were made in various cities of the country.

The conditions at this time, however, are very materially changed. The manufacturer meets and conquers his agent on entirely different grounds. He calls them in convention at the respective factories when the details of the new models are shown and explained. It is at these times that arrangements for the following year are made and the agent returns with either signed or cancelled contract in his pocket; hence the show as early in January in New York is altogether too late for the benefit of imparting knowledge to the agent, and too early to interest the individual in purchasing his car to be delivered several months hence. Mr. Pope in his letter to the manufacturers realizes this situation.

The Boston automobile show has stoutly maintained that the proper time for the show is in March, just previous to the opening of the spring, and it is at the time when the individual is commencing to long for the outdoor life and he feels the "Call of the Car" in his veins. That is the time the Boston show strikes and it catches the individual, enthuses the new recruit and results in signed orders.

I do not wish it understood that I believe that the New York or Chicago show should be abandoned. I certainly do not believe that should be the case; but I do believe that these shows should be held under the auspices of the automobile dealers in each of these cities, and that they should determine the time that is best suited for them to show the public the new models and to appeal to their local individual interests.

It is my personal opinion that the agent feels that the manufacturer should not attempt to control the situation in the individual cities, but that it should be left in the hands of the agents they have appointed, they having been satisfied they were proper people to represent their particular line; therefore, if the manufacturers' judgment in selecting their agents is correct, it occurs to me that they should acknowledge their agents' judgment in relation to the policy to be pursued with regard to the show situation.

Shows should not be held as a money-making scheme. They should be held with a view of securing as much publicity and advertising for the agent as it is possible to get, at the minimum cost, and I am of the opinion that in any of the large cities results can be obtained that would be very satisfactory to the dealers themselves.

Yours very truly,
CHESTER I. CAMPBELL,
Manager Boston Automobile Show.

Boston, Mass., Feb. 25.

Useless and Unnecessary Expense.

Replying to yours relative to the attitude of the Regal Motor Car Company on the holding of further national automobile shows in New York and Chicago, wish to state that we are in accord with the view expressed in Mr. Pope's recent letter on this subject. We believe that the time has come in the industry when it is a useless and unnecessary expense to hold automobile shows in the above named cities. We believe that a series of shows promoted by the different dealers' associations in the larger cities and held without conflict of dates is a stimulus to the retail trade, furnishing as it does the dealer a list of prospects which enables him to do good missionary work during the dull months and a resultant increase in sales during the normal selling season.

We are further of the belief that one national dealers' show should be held during the month of August in Detroit, Mich., which would serve the purpose of the manufacturer and dealer inasmuch as it would come at a time when all of the dealers wish to visit the factories, the majority of which are located in Detroit, and inspect new models, both as a finished product and in the process of construction. Selling contracts could then be adjusted in a much more satisfactory manner to both the manufacturer and dealer, and the dealers would return home with their contracts fully made for the coming season without holding off, awaiting the national shows, which has become a chronic excuse with a good many of them, resulting in a heavy loss of business for them and for the manufacturer, as a consequence.

Yours very truly,
REGAL MOTOR CAR COMPANY,
By G. D. WILCOX, Sales Manager.

Detroit, Mich., Feb. 13.

Digitized by Google

Favors Discontinuing National Shows.

In regard to abandoning the national shows, will say that we are heartily in favor of discontinuing them. We have agents scattered all over the country that are well able to take care of the shows. It is necessary for us to assist them and make certain inducements for them to exhibit the Schacht cars, and we think that would be all that is necessary. So put us down as one of them in favor of discontinuing the national shows.

Yours very truly,
SCHACHT MOTOR CAR COMPANY,
By G. A. SCHACHT, President.
Cincinnati, O., Feb. 8.

Glad to Co-Operate with Dealers.

We have answered Mr. Pope's communication advising that we are heartily in accord with the general sentiment expressed by all reputable manufacturers tending toward the discontinuance of national shows. Candidly, we do not believe the expense and effort is worth the while, and certainly fall buying is held up.

If dealers in such cities as New York and Chicago wish to hold automobile shows, that is their affair. We should be glad to co-operate in the same manner as we co-operate with Omaha, Kansas City and other large cities.

Yours truly,
VELIE MOTOR VEHICLE COMPANY,
By H. T. WHEELOCK, Motor Truck Department.
Moline, Ill., Feb. 17.

Would Not Eliminate National Shows.

We might state that automobile shows probably always have and always will serve as a great educator of the public in the construction of an article that is of eminent interest to them, as well as a novelty, and unless the shows were taken up by the dealers and carried on by them in the various states, as they now are, we would not be in favor of eliminating national shows.

There is probably nothing greater the automobile world has attempted to do to stimulate interest in and educate people in the advantages of an automobile than shows, and it will be as practical to abandon publication of newspapers and let people ferret out the happenings of the day themselves as it would be to abandon automobile shows, in the hope that people would find the new things developed by personal search.

We must admit that it is a great expense to the manufacturing industry, and probably has been carried on on too extravagant lines, but we must get into the limelight with automobiles, and cannot hide our light under the bushel.

Yours very truly,
MITCHELL-LEWIS MOTOR COMPANY,
By LEO A. PEIL, General Sales Manager.
Racine, Wis., Feb. 22.

What's in a Name?

Regarding Mr. Pope's suggestion of abandoning the national automobile shows in New York and Chicago, it strikes the writer that it may be a good plan for well established companies, who are so firmly intrenched that they do not need new dealers and distributors and can rely upon their old owners for repeat orders year after year, with no advertising. You and I may doubt whether any firm is so firmly established as this. But take the case of a rather new concern putting out a car that would appeal to dealers and owners, and cut them off from the New York and Chicago shows, and you would limit their sales very materially for the first and second season. This matter can be proved by facts, if one prefers such dry things to argument and rhetoric.

Whether it is necessary that the shows in New York and Chicago be continued as national affairs, we do not know, but it strikes the writer that whether they are called dealer's shows, national shows or international shows, if continued at all, they cannot help but attract the same attention which they have always attracted.

It does seem that a show in New York or Chicago, that is planned on a big line must continue to be a national affair in fact, whether it is so in name or not. Both New York and Chicago seem to be national centres in affairs of wide scope; no man or body of men can denationalize these places. Shows of any size held in these centres are bound to have national significance no matter what the name, just as newspaper advertising in these centres always has something of a national effect, because of the wide circulation of metropolitan papers.

As far as that goes, the New York show can well claim the distinction of being an international show. There are scores of export agents, who make it a point to visit the show and use it as a basis for the placing of orders for export shipments to the most distant places of the globe.

The results obtained by the Empire Automobile Company in New York and Chicago go to prove that the Middle West manufacturer reaching out to the East can concentrate in the New York show a great deal of successful selling and advertising work, and line up important distributors, that for some reason or other could not be lined up before the New York show.

In Chicago this company was in the not unusual position of being forced to hold a private show, because of not being able to obtain adequate space in the Chicago show. This, of course, was laboring under a disadvantage, but in view of the new distributors and dealers lined up at the Chicago show, it strikes us that the Chicago show was a success for this company, which had only a "side show." Dealers and distributors from the Middle West and West go to the Chicago show because it has national significance. Many also come to Chicago from the effete East.

Very truly yours,
EMPIRE AUTOMOBILE COMPANY,
By HARLOW HYDE, Advertising Manager.
Indianapolis, Ind., Feb. 22.

Agrees with Pope, but Not with Miller.

We indorse Albert L. Pope's position regarding shows, but we do not indorse Chas. E. Miller's position. Miller's business is very largely with the dealer, and naturally he would favor a dealers' show. Our business is largely with the manufacturer, and we would like to see all shows done away with where accessory goods are shown. No accessory people could afford to make exhibits at all local shows, unless it would be the tire manufacturers, and they probably would not do so.

Speaking personally, we go to New York and Chicago with a few sets of axles and wire wheels, and spend a couple of thousand dollars to exhibit those goods. The very man we want to interest most will not even look at them—that is, the manufacturer—they know the line; know any well advertised line, and to us it seems a foolish expense. We would much rather take the same money and place it in a trade journal, believing we can get very much better results, because our publicity would be general.

Mr. Pope has placed the matter very clearly before the manufacturer, and he has stated the truth so clearly that no one can misunderstand. Chas. E. Miller's attitude is purely from a dealer's standpoint and not a broad one at all.

Very truly yours,
McCUE COMPANY,
By B. F. McCUE.
Buffalo, N. Y., Feb. 21.

Local Shows Conducive to Sales.

As manager of our local show for the past seven years and as a visitor at the national shows for the past 11 years, I feel that I have had a very fair opportunity of comparing the two forms of display. In my opinion the local show is a better proposition from every standpoint than the national show. One of the best indications of this is the remarkable growth and success of the local shows.

When I went over to the Chicago shows in 1902-3-4 and 5, I could count on meeting, 50, 60 or even 100 dealers from Nebraska who were going over to take in the big show. When I went over this last time there were not to exceed five Nebraska dealers on the train. Of course there are a great many more dealers in Nebraska than there were four of five years ago, and in talking with them and from information received from travelling salesmen who cover this territory, I find that the dealers are cutting out the national shows in favor of the Omaha exhibit.

These local shows are conducive to direct and immediate sales to a larger extent than the national shows. The dealers of this territory not only come in themselves, but in nearly every instance bring in prospective customers. Last year I remember one dealer brought in 20 live prospects for cars, and others brought in 10 to 15. You can readily understand how a dealer doing business in this territory would prefer to make a trip of this kind than to go to New York or Chicago where there was absolutely no prospect of his making sales.

Digitized by Google

Further than this, a show such as our Omaha show really gives as much to the dealer as the show in Chicago or New York. We don't have the great number of cars on exhibition here, but we do have on display practically every well known make of car, and the models shown are those which are practicable for use in this territory. I am instancing the Omaha show as this is the only local show I have had any experience with.

Yours very truly,
C. G. POWELL, Secretary,
OMAHA AUTOMOBILE SHOW ASSOCIATION.
Omaha, Neb., Feb. 18.

Should Support Dealers' Shows.

I have long been of the opinion that there would be a much more favorable situation created for dealers if manufacturers would give support to dealers' shows in the various cities of the country. I believe that manufacturers would obtain greater benefits by affording assistance to local dealers in the maintenance of these displays. It would permit of advertising over a more extensive territory and the national shows would not then detract from the importance to the local communities of shows in the smaller cities.

Sincerely,
C. A. SIMMONS,
(Manager Albany Show.)
Albany, N. Y., Feb. 19.

In a statement issued for publication, Stewart McDonald, vice president and general manager of the Moon Motor Car Company, St. Louis, Mo., has the following to say upon this subject:

Worth Their Cost in Educational Value.

I consider automobile shows a great gathering to educate the public regarding the technical features of automobile construction and design. These shows are much less of the nature of motor marts than the average person realizes. We, for instance, rarely if ever even go so far as to ask a visitor to our exhibit anything about his intentions, or attempt in any way to offer selling arguments. We are always very glad indeed to have people manifest an interest in our various models and constructional parts, and usually have from three to six or seven young mechanical engineers, recent technical school graduates, on hand to answer questions and explain any points upon which visitors manifest a desire for more information.

I consider the great thing which the automobile shows stimulate is natural interest in automobiles, and once this interest is created the sales will follow, if your car is good, without your being compelled to resort to the strong arm methods happily absent from automobile selling, but not so far away from many industries which do not attempt to enlighten the public. Automobile shows mark the progress in the industry, and are worth their cost from the educational standpoint, entirely aside from their value in creating immediate business.

AUTOMOBILE AIDS SURGERY.

Dr. Fred Albee Utilizes Borland Electric as Portable Storage Battery.

Few men enjoy a wider reputation as a surgeon than Dr. Fred Albee of New York City. Recently he was called to the Children's Memorial Hospital in Chicago to assist Dr. E. W. Ryerson, the head of the institution, in performing a particularly delicate operation in bone surgery. In the two cases to be treated the front of the spine had been eaten away until the patients were humpbacked to a pitiful degree.

An electric motor controlling a circular saw was required in order to cut away a strip of bone .5 inch wide, .25 inch thick and about six inches long from the patient's upper leg, this being transferred to the front of the spine, thereby strengthening and straightening it in a manner necessary to heal the growth. Upon Dr. Albee's arrival from New York, however, it was made known that his instruments operated on direct electric current only, whereas all the hospital lighting was of the alternating type.

The Commonwealth Edison Company was summoned by telephone, but could do nothing beyond supplying a rectifier, which would take some time to install. Bruce Borland of the Borland-Grannis Company, maker of the Borland

Borland Electric Aids Famous Surgeon in Performing Remarkable Operation.

electric car, solved the difficulty by sending one of these machines to the hospital. An accompanying illustration shows the car, from which a cord led to the third story hospital window, supplying the necessary direct current for the surgical instruments.

Dr. Ryerson has utilized Borland electric cars in three other similar instances, and is enthusiastic in his recommendation of their ability as movable storage batteries.

A new motor organization, to be known as the Washington Motorists' Association, is being organized to take the place of the Automobile Club of Washington, D. C., recently disbanded.

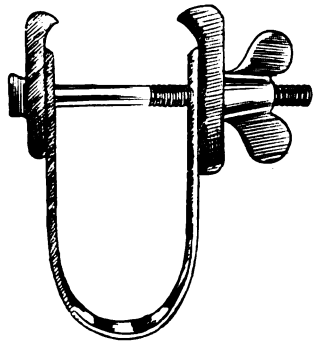
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



Security Spring Spreaders are produced by the Security Reliner Company, Montgomery, N. Y., and as the name implies are utilized to spread the leaves of vehicle springs so that they may be cleaned and lubricated. The device is in the form of a clamp having a threaded bolt and wing nut. The clamp carries a pair of pointed jaws, which face each other and are slipped between the leaves and tightened by the wing nut. This separates the leaves enough to permit of introducing the cleaning and lubricating elements. The Security spring spreader is moderately priced.

★

The Gilmer Fan Belt is manufactured by the L. H. Gilmer Company, 52 North Seventh street, Philadelphia. It is of the endless type, being woven and constructed of a material which is held to be oil and water proof. It is made especially for model T Ford automobiles and one of the qualities emphasized is its gripping ability, the maker holding that greater efficiency is secured by allowing it to run loosely. It is inexpensive.

★

The Automatic Fire Extinguisher is the product of the Inst Lighter Company, Columbus, O., and operates on the sprinkler principle. It comprises a metal container which is mounted on the front of the dash inside the hood, and carries a fusible head which melts when subjected to a certain temperature. The vessel contains about 2000 cubic feet of heavy fire extinguishing gas, called "Fire Out," which smothers the flames when the fusible head of the container is melted.

Gilmer Fan Belt

Automatic Fire Extinguisher

Endurance Inner Tube

Endurance Red Inner Tubes are produced by the Endurance Tire & Rubber Company, New Brunswick, N. J., and qualities emphasized are thick and substantial construction, and the use of a high grade of rubber. It is held that their durability is due to the special process of treating the materials and that they are patched easily. Endurance tubes are guaranteed and are constructed for both automobiles and motorcycles.

★

The Chau-Phone is the product of the Western Electric Company, Chicago, and is an automobile telephone. It comprises a hand transmitter for the passenger connected to a loud speaking receiver located conveniently to the chauffeur's ear and is designed to replace the conventional speaking tube. It is claimed by the maker that ordinary tones are magnified by the megaphone shaped receiver and that it is not affected by the vibration of the car or the wind. It is operated by six-volt batteries and may be connected to the usual members. The transmitter is provided with a gravity switch, entirely automatic in its action, the circuit being broken when the transmitter is replaced in its pocket, which may be located as desired. The receiver is weather proof and is finished in dull black, nickel or polished brass.

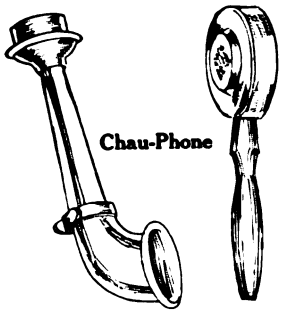
★

The Improved Priming Cup is marketed by the Auto Parts Company, West Jackson boulevard, Chicago, and is operated easily, the work involving a quarter-turn of the handle. It is claimed by the maker that it will not leak or stick and that it may be attached in places not adaptable

Digitized by Google

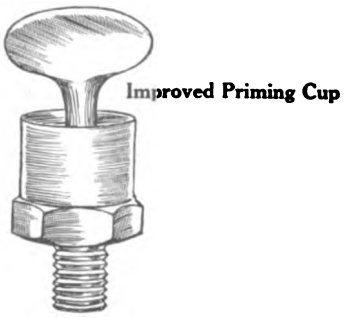
to other forms of priming devices. It is constructed with short, long and angle shanks, .125 and .25 inch. The cups are inexpensive.

—— ★ ——



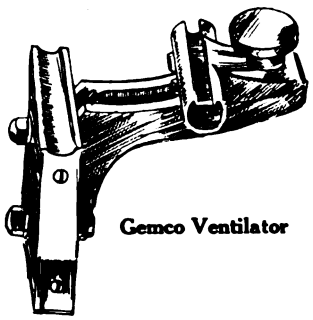
The Gemco Ventilator is manufactured by the Garage Equipment Company, Milwaukee, Wis., to provide ventilation of fore door cars by moving the lower half of the windshield and deflecting the currents of air. The device is bolted to the filler board or dash and has a sliding member which is secured to the frame of the shield by two screws. A screw having a knurled head is utilized to lock the sliding member in position, the maximum adjustment permitted being two inches. Two ventilators comprise a set and they are finished in brass or nickel. They are moderately priced.

—— ★ ——



The Detroit Auto Heater is manufactured by the Detroit Auto Heater Company, Detroit, and differs from the usual heaters in that provision is made for conveying warmth to the front compartment of the car as well as the tonneau. The exhaust gases from the motor are led to the heaters and after passing through these members are conveyed by a tubing to the muffler. Means are provided to adjust the heat as well as to shut off the supply and without interfering with the operation of the muffler. The heaters are neatly finished, all castings being of aluminum, and being compact do not occupy much room. The equipment is moderately priced and the maker states it may be installed easily.

—— ★ ——



The Halladay Package Carrier will be appreciated by motorists who have attempted to secure packages or dress suit-

Improved Priming Cup

Gemco Ventilator

Detroit Auto Heater

Halladay Package Carrier

cases to the running board with ordinary straps or rope. The device comprises two metal arms, to the upper end of which straps are secured, these having the usual buckle for making adjustments. The lower portion of one is provided with an arm, while the other carries a wing nut and clamp. The second holder is slidably mounted, permitting the carrying of a thin or thick package, which is retained by the arms and heavy straps. The carrier is finished in black japan and a quality claimed for it is that it does not injure the running board. It is made by the L. P. Halladay Company, Streator, Ill.

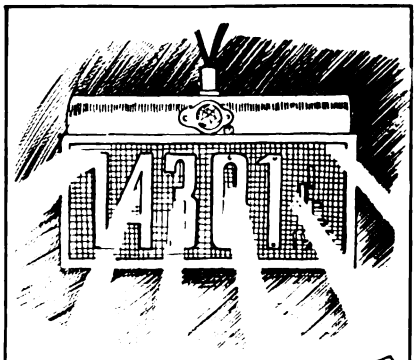
—— ★ ——

The Tesla Light is manufactured by the Tesla Auto Light Company, 1324 Michigan boulevard, Chicago, and is designed to comply with the laws of those states which require the license numbers to be illuminated after dark. Some ordinances provide that the numbers shall be legible at a distance of not less than 150 feet and others at more. The Tesla is an electrical unit and in addition to the usual red semaphore comprises illuminated numbers.

—— ★ ——

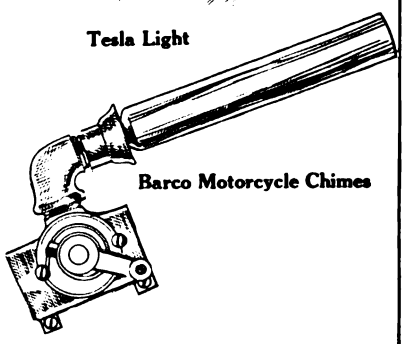
Barco Motorcycle Chimes are manufactured by the Barco Brass & Joint Company, Chicago, and the 1913 design is an improvement over previous models. Three harmonizing notes are produced by the exhaust gases and the volume of sound is controlled by the rider. The signal is operated by a lever conveniently located, and it is claimed that the actuating valve will not clog or become loose. The horn is attached in the exhaust pipe and all parts are heavily nickel plated. Valves vary from .875

Digitized by Google



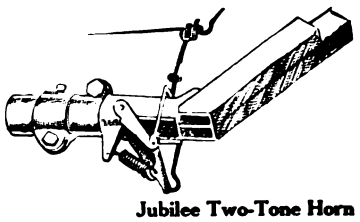
to 1.5 inches. The signal is moderately priced.

—— ★ ——

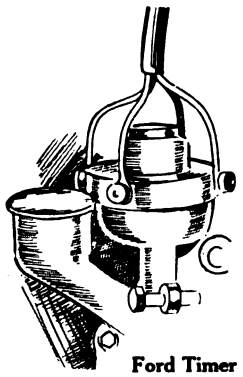


The Jubilee Two-Tone Horn, manufactured by the Randall-Faichney Company, Jamaica Plain, Boston, is actuated by the exhaust gases of the motor and operated by the conventional pedal. Its tone is clear and penetrating but not harsh, and the volume of sound is controllable. It is constructed of high grade material and comes complete with cable, brass pedal, attaching coupling, cable clamps, pulleys, etc. It is installed easily and is constructed for cars of varying horsepower, etc. It is moderately priced.

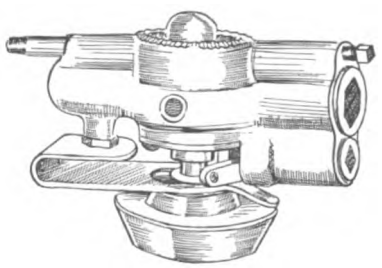
—— ★ ——



Woodward Tire Pumps, manufactured by Woodward & Son, 1229 Nicholas building, Toledo, O., are automatic, stopping when the predetermined amount of air has been pumped into the tire. The pump is a two-cylinder opposed unit, having a 1.125-inch bore and stroke. It is stated that it will pump 2.5 cubic inches of free air each revolution and compress it to 200 pounds. It is double acting, giving an impulse of air at every stroke. It is permanently attached to the car by means of adjustable brackets and is actuated by the motor through friction, a leather faced wedge shaped wheel being moved into contact with the periphery of the flywheel. The friction member is thrown into engagement by a small starting lever mounted on the floorboard of the car and the dash is provided with a connection for the hose. The latter is a high grade flexible tubing, 10 feet long, and is equipped with a connection for the dash member. When the flywheel is enclosed the pump



Tesla Light



Barco Motorcycle Chimes

Jubilee Two-Tone Horn

Ford Timer Device

Woodward Tire Pump

is operated by a gear and a slip gear on some exposed shaft, such as the pump, magneto, or the secondary on the transmission or camshaft. Means are provided for meshing and releasing the gears automatically. The lubricant utilized with the pump is entirely vegetable and the maker states it will not injure a tire no matter how much it is employed.

—— ★ ——

The Ford Timer elevating device is marketed by the Ford Parts Specialty Company, 1211 Main street, Richmond, Ind. It is adapted to replace the usual model T Ford timer and when installed is held to make for greater accessibility as well as convenience. The timer is placed in a vertical position instead of horizontal, this being accomplished by an adapter. The timer shaft is actuated by hardened spiral gears and the commutator is constructed of high grade material and nicely finished. The maker states that the device is easily installed, the work requiring no special tools and that greater motor efficiency is possible through accurate timing of the break of the primary circuit. Another feature emphasized is that the wires are easily accessible in the event of a short circuit or breakage.

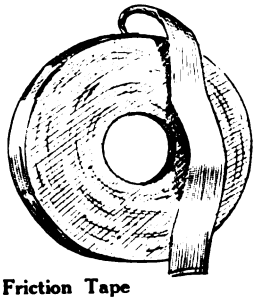
—— ★ ——

The Schoen-Jackson hot air pipe connection is manufactured by the Schoen-Jackson Company, Media, Penn., maker of the Feps carburetor. It is constructed to convey heated air from the exhaust pipe or manifold to the intake port of the carburetor, thereby assisting in the vaporization of the fuel as well as making for economy. The part fitting the vaporizer is a one-piece brass stamping and the tubing is

Digitized by Google

flexible. A two-piece member is employed for attaching to the exhaust pipe and this is secured by screws having locknuts. It is moderately priced.

—— ★ ——

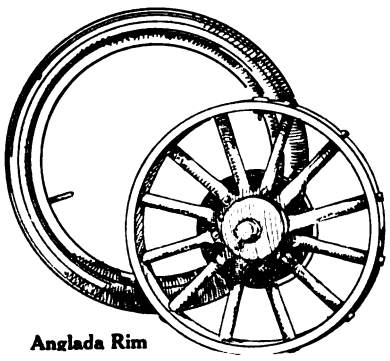


J-M Friction Tape is the product of the H. W. Johns-Manville Company, New York City. It is carefully constructed, being closely woven and having both sides uniformly covered with insulating compounds. Every thread is thoroughly impregnated by a specially designed machine, insuring great insulating efficiency and adhesive power. It is made for insulating automobile and electric light wiring and a quality emphasized with it is that it will not dry up and lose its efficiency. It is made in two brands, Nos. 3 and 4, and is put up in one, two, four and eight-ounce rolls, .75-inch wide.

—— ★ ——

The Staon Tire Gauge is the product of the Advance Specialty Company, Rochester, N. Y., and a feature of the device is its compactness, measuring as it does less than two inches in height and one inch in width. It is attached by screwing onto the valve stem and need not be removed except when changing tires. The calibrated dial is concealed and protected by a cover which is opened easily, enabling the driver to note at a glance whether the shoe needs inflation. It is stated that the gauges will not leak and that rubber packings are unnecessary. They are constructed on the same general principle as a steam gauge, employing a hollow curved tube, known as a Bourbon tube, to actuate the pointers, this tending to straighten out under the influence of the pressure. They

S-J Hot Air Pipe



J-M Friction Tape

Staon Tire Gauge

Tinol Solder-Stick

Anglada Rim

are packed in sets of four, one for each wheel, in a handsome case and a pair of nickeled wrenches accompanies each outfit. All parts are nickel plated.

—— ★ ——

The Tinol Solder Stick is a new form of solder of that name brought out by Hess & Son, 1031 Chestnut street, Philadelphia. The stick is about five inches long, sells for a few cents and does not require flux or acid. To use it the part to be mended is heated and the solder applied. All that is essential is to have the work clean. One stick comprises enough material to complete a number of repairs and being compact is carried easily in the tool kit. It is held that the flame of a match or a candle is sufficient to heat the part and melt the solder.

—— ★ ——

The Anglada Rim, manufactured by the Anglada Company, 650 Woodward avenue, Detroit, is of the quick demountable detachable type and it is held to be applicable to wire as well as wood wheels. Features claimed for the construction are that it may be fitted to wood wheels without rebuilding; that it can be applied to all existing types of quick detachable rims, and that all standard makes of clincher and quick detachable tires fit the rim. The construction is simple, nuts, bolts, clamps, washers, etc., being eliminated. It has a series of strong clips formed integral with it, while the band on the wheel carries integral lugs with which the clips engage and lock when an eccentric is turned. To remove the rim a hexagon locknut on the stem of the eccentric is loosened and the clips are disengaged by turning the eccentric in the opposite direction.

HOLLAND WITH DETROIT ELECTRIC.

Well Known Authority on Storage Battery Development Heads Research Department.

The Anderson Electric Car Company, maker of the Detroit electric, has appointed Walter E. Holland manager of its mechanical and electrical research department. Mr. Holland is an electrical engineer of high standing and his reputation as an authority on storage batteries and their applications is well known. From January, 1911, to February, 1913, he was chief electrical engineer of the Edison Storage Battery Company of West Orange, N. J.

Walter E. Holland, Electrical Expert, with Anderson Electric Car Company.

Mr. Holland was associated with the Edison companies as early as 1902, aiding in the development of the first types of the Edison battery, which included tests of lead-acid batteries and road tests of various types of electric vehicles, equipped with both types of battery. Subsequently he was closely connected with Thomas A. Edison in various lines of research work and won the high personal regard of the great inventor. Mr. Holland is responsible for many important discoveries in connection with storage batteries and has invented a number of improvements in them. He has written articles and presented papers before engineering societies, a number of which were later translated into several languages. His appointment by the Anderson Electric Car Company is most important and is assurance that the Detroit electric will be still further perfected through the expert knowledge of Mr. Holland.

RE-ELECTS OLD BOARD.

Recently Organized Manhasset Company Anticipates Successful Business in Tire Fabrics.

At the annual meeting of the stockholders of the Manhasset Manufacturing Company, Putnam, Conn., held at the company's offices at Providence, R. I., it was unanimously voted to increase the capital stock of the concern from $175,000 to $250,000 by an issue of 7 per cent. cumulative preferred stock. This action was made necessary in order to care for the increased business since the start of operations six months ago. Ninety per cent. of the total stock was represented at the meeting. The company manufactures high grade fabrics for use in automobile tires and it anticipates a very prosperous year.

The concern was incorporated under the laws of Rhode Island, with offices at Providence, the factory being located at Putnam, Conn. The treasurer's report showed a gratifying financial gain and the following officers were re-elected: President, E. V. Livesey, Fall River, Mass.; vice

Digitized by Google

president, Albert Howarth, Providence, R. I.; treasurer and agent, R. H. Ballou, Woonsocket, R. I.; secretary, H. J. Thayer, Putnam, Conn. These four, with William Muir and C. A. Lord of Providence, and William S. Cherry of Fall River, form the board of directors.

NEW TRUCK CONCERN.

Admiral Motor Company to Be Organized to Produce 1000-Pound Wagon in St. Louis.

It is said that the Admiral Motor Company will soon begin manufacturing operations at St. Louis, Mo. Don E. Evans, now acting as sales manager for the Alma Manufacturing Company, St. Louis, will act as general manager for the new concern, which is expected to produce an approved type of motor truck.

The vehicle will be a 1000-pound wagon. Work will be started with about a dozen men, it is said, but the force and output will soon be increased. A light farm tractor will also be manufactured. It is stated that citizens of St. Louis already have subscribed for $10,000 of preferred stock, the total capital being $50,000.

TO PRODUCE HOFF CAR.

Company Organized at La Crosse, Wis., to Promote Design of Hofweber Brothers.

The organization of the Hoff Motor Company, a $1,000.000 corporation, to manufacture automobiles at La Crosse, Wis., is said practically to have been completed. The articles state that $100,000 of the capital has been subscribed and the right to increase the capitalization to $100,000,000 is reserved. The idea of a factory at La Crosse was proposed by Joseph E. Hofweber of 1606 Jackson street, that city, who has constructed a model car at Detroit, with the aid of his brother, August Hofweber. Should the capital be placed at $1,000,000 eventually, it is understood there will be $250,000 preferred stock and $750,000 of common stock issued.

The tentative plan submitted to the stock subscribers provides for the manufacture of the first 20 cars at Detroit. These will be given a thorough test in various parts of the country before others are made. When the success of the new machine has been demonstrated to the satisfaction of the organizers and stockholders, a plant will be erected at La Crosse and business started on an extensive scale.

IS PURCHASING AGENT.

E. E. Westman Leaves Cole Forces to Join Interests with Henderson Company.

E. E. Westman, who has been purchasing agent for the Cole Motor Car Company, Indianapolis, Ind., since October, 1909, has resigned to accept a similar position with the Henderson Motor Car Company of that city. As a result of the move he will again be associated with J. M. Smith, formerly factory manager of the Cole company, who is now the Henderson factory manager.

Mr. Westman has been regarded as an important factor in the success of the Cole, and before his connection with that company he held a responsible position with the Weston-Mott Company of Flint, Mich., for some time. The Henderson brothers were well informed of his ability through their close connection with the Cole factory organization during the life of the Henderson Motor Sales Company, which acted as Cole distributor for a number of years. His acquirement is another step in the plan of the Hendersons to strengthen their organization by the addition of some of the best talent in the automobile industry.

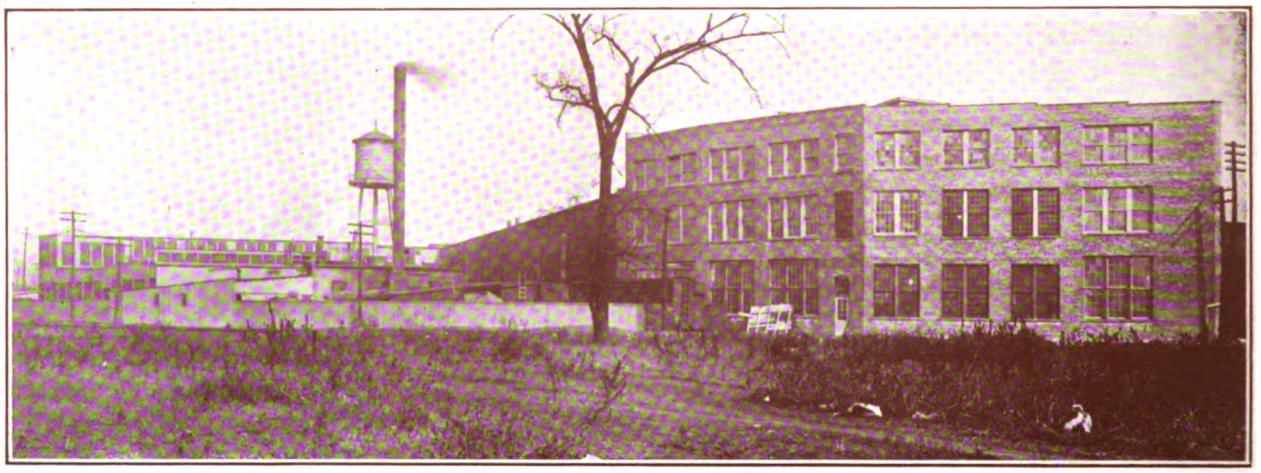
E. E. Westman, Purchasing Agent, Henderson Motor Car Company.

ADDED MANUFACTURING FACILITIES.

Ford Plant at Long Island City Preparing for Increased Business in Its District.

A recent consignment of Ford cars to arrive from the home factory at Detroit, at the sub-factory at Long Island City, N. Y., made up 93 carloads, of which about 60 were of automobiles in the rough, and the 33 others of semi-assembled

Digitized by Google



machines. The entire train load comprised about 700 Ford automobiles.

A large addition is being built to the Long Island plant and still another building is to be added, it is stated. New York has contracted for 13,500 Ford machines this year and the Boston branch, which is in the same district, will take 10,000.

FACTORY ADDITION COMPLETED.

Three-Story Building Provides Much Needed Room for National Motor Vehicle Company.

The National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, has completed another addition to its already large plant in the Indiana metropolis. The latest addition, required by the steady increase in business, is a modern brick and cement building that allows general expansion and at the same time increases efficiency and eliminates any possible lost motion in getting materials from one department to another.

Two-Story Addition Recently Completed for the National Motor Vehicle Company, Maker of National Cars at Indianapolis, Ind.

The new building, shown in an accompanying illustration, allows 20,000 feet of floor space and there are three floors. It is built at the rear of the company's 22nd street plant. On the first floor will be a general expansion of the machine shops, while the second floor will permit an enlargement of the paint department and the installation of modern equipment. The top floor provides an enlargement of the trimming and upholstery departments and has been especially arranged to afford exceptionally good light and ventilation. The National factories are now working day and night shifts.

GOODYEAR INTERESTS INVOLVED.

Purchase Control of the Killingly Company, Engaged in Manufacturing Cotton Goods.

Interests identified with the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, have purchased the control of the Killingly Manufacturing Company, which has a plant at Williamsville, in the town of Killingly, Conn., for the manufacture of cotton goods. These men have entered the directorate, which has elected a new set of officers.

The official roster of the firm follows: President, Benjamin F. Smith of the B. F. Smith Construction Company, Pawtucket, R. I.; vice president, P. W. Litchfield, Akron, O.; treasurer, W. E. Palmer, Akron, O.; assistant treasurer, W. Irving Bullard, Danielson, Conn. These men and W. T. Teagan of Boston and A. M. Bannister of Providence, R. I., make up the new board of directors. Material improvements and additions to the plant will be made in the near future.

CAPT. LEWIS RESIGNS.

Joseph Winterbotham Becomes Head of the Mitchell-Lewis Motor Company.

Announcement is made by the Mitchell-Lewis Motor Company, Racine, Wis., maker of Mitchell cars, that Joseph Winterbotham, Jr., of Chicago, has been elected president of the concern, to succeed Capt. William Mitchell Lewis, resigned. Mr. Winterbotham for the past two years has represented the banking interests that have financed the Mitchell-Lewis concern.

PNEUMATIC TIRES UNNECESSARY.

Kansas City Plant to Produce Cars Equipped with Patented Steel Wheels.

J. North Carnahan of Washington, D. C., representative of the Bernston Steel Wheel Company, Bethlehem, Penn., is quoted as saying that the company will establish a new automobile factory at Kansas City, Mo., which will feature a recently patented steel wheel in an assembled car. The factory is to be one of a chain of six throughout the United States.

According to information from Kansas City, the company only manufactures the steel wheels, the motor cars proper being purchased by contract and assembled at the Bernston shops. The Bernston wheel is made with steel spokes in such manner that it is claimed pneumatic tires are unnecessary.

STREATOR PLANT REOPENED.

Limited Number of Cars Being Made and Halladay Owners Assured of Service.

It is reported that the Streator Motor Company plant, Streator, Ill., in which Halladay cars were made previous to the suspension of operations brought about by bankruptcy proceedings, is again in operation, having been taken over by A. C. Barley, secretary and director of the Rutenber Motor Company of Marion and Logansport, Ind.

Mr. Barley is said to have purchased it of the Merchants Realization Company, Chicago, which concern secured the plant at bankruptcy sale with the intention of dismantling it.

It is understood that cars are being made in a conservative way and that an adequate service department for Halladay owners also has been established. The machines will be manufactured with the idea of meeting the requirements of old agents of Halladay cars and later operations will be conducted on a larger scale.

RESPONSIBLE FOR LENOX SALES.

William Blanchard Owes Success to Thorough Knowledge of Constructional Details.

The importance of placing well trained men in charge of the sales department is understood by most automobile manufacturing concerns, but it is seldom that a company is more fortunate in this respect than the Lenox Motor Car Company, Boston, Mass., maker of Lenox cars. William Blanchard, sales manager of the Lenox company, not only is well equipped with sales ability, but he is thoroughly conversant with every detail in the construction of automobiles.

Mr. Blanchard has been connected with the industry for the past six years. He gained his rudimentary knowledge of motor cars with the Easton Machine Company, South Easton, Mass., maker of the Morse line. Here he worked in every department, serving his full time at the bench and in the shop. It was while acting as salesman for Morse cars that the Lenox company induced him to undertake the exploitation of its line.

William Blanchard, Sales Manager, Lenox Motor Car Company.

Undoubtedly some of his success may be traced to the fact that he has a wide circle of friends and acquaintances, particularly in New England. His first connection with the Lenox company was as salesman, dating from 1911. Early in 1912 he was promoted to become sales manager, and in this position he has had much to do with the success of the Lenox Motor Car Company, particularly during the past year.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson cars, has entered a car in the third annual 500-mile race to be run in that city May 30. William Knipper will be the driver and his mechanic will be Frank Jones, who has ridden with him in many races in the past. The Henderson machine was introduced to the public on the occasion of the second 500-mile race and the entrance of the car in the coming event will be in the nature of a celebration of its first appearance. This will be the first Henderson machine that has taken part in a race meet of this character.

REMY GRAND BRASSARD.

Becomes One of the Awards for the Memorial Day Race at Indianapolis.

The Remy Electric Company, Anderson, Ind., maker of Remy magnetos, has decided to offer the Remy Grand Brassard and trophy as the prize to be awarded the car and driver which first completes 200 miles in the 500-mile race at Indianapolis, Ind., Memorial Day. The Remy company first made this award in August, 1909, for a 25-mile free-for-all race. It was won by Barney Oldfield, driving a Benz. Subsequently it was held by Ray Harroun, Robert Burman, Joseph Dawson and others.

Under the conditions of the prize offer it is stipulated that if the car first covering 200 miles in the big race is equipped with a Remy magneto, the driver will also receive a cash award of $50 a week for a period of 20 weeks. Otherwise the Grand Brassard only is offered. The trophy goes to the manufacturer nominating the car. They will remain in the possession of the winners until the Remy company demands possession of them as prizes in subsequent races.

ABBREVIATIONS.

Gasoline.

Acet, acetylene.
Air, compressed air.
Amid, amidships.
Bevel, shaft with bevel gear at rear axle.
B & P, ball and plain.
B R & P, ball, roller and plain.
Cell, cellular.
Cent, centre.
Con Bd, contracting band.
Doub, double.
Dual 2, double distributor.
Elec, electric.
Exp Bd, expanding band.
Float, floating.
Fric, friction.
Gear, spur.
Gov, governor.
Grav, gravity.
Head, both valves in head.
Hel'l, helical.
L & H, left side and in head.
Mech, mechanical.
Noncir, non-circulating.
Opp, valves on opposite sides of cylinder.
Opt, optional.
P & R, plain and roller.
Plan, planetary.
Plat, platform.
Pres, pressure.
Pro, progressive.
Rad Rd, radius rods.
Road, roadster.
Roll, roller.
R & H, right side and in head.
S & R R, springs and radius rods.
R & T R, radius rods and torsion rods.
S & T T, springs and torsion tube.
Sel, selective.
Semi F, semi-floating.
Sep, separate.
Spl'l, spiral.
Spld'rf, Splitdorf.
Spl Pres, combined splash and pressure.
Spr, spring.
Thermo, thermo-syphon.
Tor T, torsion tube.
Tor Rd, torsion rod.
Tour, touring.
Tub, tubular.
Unit M, unit with motor.
Unit X, unit with axle.
Worm, shaft with worm at rear axle.
½ Ell, semi-elliptic.
¾ Ell, three-quarter elliptic.

Electric.

Be, bevel, shaft drive with bevel gear reduction in rear axle.
Br, brougham.
C B, colonial brougham.

FIRST WOMAN DRIVER.

Mrs. John Howell Phillips of St. Louis Claims This Distinction in America.

Mrs. John Howell Phillips, a former Chicago society woman, now residing at Maple Lodge, St. Louis, Mo., is believed to be the first American woman to drive an automobile. Illinois license No. 24 was issued to her 14 years ago. This fact was divulged through the recent effort of Mr. Phillips to repurchase, as a relic, the machine his wife drove in Chicago in 1898.

The car was nameless, but was known as a tri-motor. It was conceived by an Englishman, who came to America in 1898 with a roll of blue prints and $50,000. Subsequently the Western Wheel Works produced several of the machines. The automobile has three wheels, one in front and two in the rear, and a long steering handle reached from the front wheel. Its maximum speed was 18 miles an hour.

Mrs. Phillips is still devoted to motoring, which she declares is woman's best tonic. She now owns and operates a six-cylinder Hudson, made by the Hudson Motor Car Company, Detroit.

In the gymkhana contests held recently at Sydney, Australia, the Cartercar, made by the Cartercar Company, Pontiac, Mich., won two first and two second prizes. These events served to determine ease of control, ease of changing speeds and, especially, ability to pick up speed.

TAUNTON'S SECOND SHOW.

Small but Interesting Exhibit of Machines in Ninth Company Armory.

The second annual show of the dealers in Taunton, Mass., was held in the Ninth Company armory in that city, Feb. 19-22. The lack of space prevented a large showing of cars and only 24 machines were displayed. The color scheme was yellow and white. The following exhibitors were represented:

Carlow Auto Company, Buick; Robertson Motor Car Company, Cadillac; Central Garage, Regal; Perry Auto Company, Premier, Rambler, Ford; S. & M. Garage, Stevens-Duryea, Hudson; Peck & White, Stoddard-Dayton, White; Howard L. White, Overland, Pope-Hartford; Brownell & Burt, Studebaker; Arthur H. White, accessories.

W. S. Jewell, formerly district manager for the R-C-H Company of New York City, has been appointed sales manager for the Boston branch of the Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly-Springfield trucks. P. S. Aultman will continue as manager. The Boston branch is located in the Shoe & Leather building, Cambridge.

VISIT OF BRITISH ENGINEERS AND MAKERS.

ONE of the chief events of the year will be the joint visit of the Institution of Automobile Engineers and the Society of Motor Manufacturers and Traders of Great Britain to the United States. This visit has been arranged in response to the invitation extended by the Society of Automobile Engineers during its trip to England and the Continent in 1912. The British party will leave London, May 17, and is expected to arrive in New York, May 26. During the next two weeks the visitors will inspect a large number of automobile factories and those of allied industries, and otherwise enjoy themselves generally.

The Minnewaska of the Atlantic Transport Line has been selected as the official boat. Upon its arrival in New York two days will elapse before the actual programme of entertainment will begin. This time has been set apart in order to admit of any delay occasioned by the failure of the boat to maintain its schedule, and to permit the visitors to enjoy themselves as they see fit in New York. The official hotel will be the McAlpin.

Wednesday, May 28, the party will leave New York on a special train of compartment cars, going to Pittsburg, taking advantage of the daylight trip over the Allegheny mountains and around the famous Horseshoe curve. This train will be the official headquarters of the party throughout the entire trip, and will be sidetracked in each city for sleeping and living rooms. May 29 the party will inspect at least one of the large steel plants in Pittsburg, leaving in the evening for Indianapolis.

Memorial Day will be devoted to witnessing the 500-mile race on the Indianapolis speedway. The British committee also points out that this occasion will afford an excellent opportunity to observe the privately owned cars of thousands of Americans who will be present at the race. Saturday, May 31, it is planned to inspect the plants of the American, Cole, Henderson, Marion, Marmon, National, Stutz and Waverley companies.

Sunday morning the train will reach Detroit. Monday and Tuesday the visitors will inspect the Cadillac, Chalmers, Ford, Hudson and Packard factories, as well as the plant of the Timken-Detroit Axle Company. The evening of June 3 the Society of Automobile Engineers will tender a banquet to the members of the party, and late the following day the members of the three organizations will embark on the Detroit III for the annual midsummer meeting of the S. A. E. The British engineers will present papers and enter into the discussion following those read by the Americans. Three days will be spent on board the boat, during which time several points of interest about the Great Lakes will be visited.

June 7 the party will transfer at Detroit to the night boat for Cleveland, where the works of the Peerless, Stearns, White and Winton companies will be viewed. After one day in Cleveland another boat will be taken to Buffalo, for the inspection of the Pierce-Arrow plant and a visit to Niagara Falls. Those who wish may return to New York by train from this point, while the remainder of the party will go to Providence, R. I. June 11 will be spent in inspecting the plant of the Brown & Sharpe Manufacturing Company in Providence. The morning of the 12th will find the party at the Locomobile factory in Bridgeport, Conn., and the afternoon at one of the large carriage factories in New Haven. Friday, the 13th, the members will visit the Pope-Hartford plant in Hartford, and possibly the Knox factory in Springfield. That night the Hartford boat will take the visitors down the Connecticut river and along Long Island sound to New York.

The trip is expected to be of mutual benefit to the British and American manufacturers and engineers, through the opportunity afforded for general discussion and for a better understanding of the methods obtaining in each country. The committee in charge of the British party outlines the advantages to be gained as follows: "There is, of course, much in the condition of the two countries which necessitates fundamental difference in method, but Englishmen find, as a rule, quite as much to learn in America, as Americans do in Europe."

In the factory of the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, there is an inspector to every six tire makers. These inspectors are themselves past masters in the art of making tires and each shoe is inspected 10 times before the last ply of rubber is laid. On each casing there is the serial number. From this number can be traced the person who made the tire, the date on which it was made, date it was cured, as well as the number of the press it was cured in. In fact this serial number gives the whole history of any particular tire.

COMING EVENTS.

March.

March 8-15—Pleasure car show, Boston, Mass.
March 10-15—Commercial car show, Des Moines, Ia.
March 12-15—Show, Ogdensburg, N. Y.
March 17-22—Commercial car show, Buffalo, N. Y.
March 17-22—Show, Norfolk, Va.
March 19-26—Commercial car show, Boston.
March 24-29—Show, Indianapolis, Ind.
March 29-April 5—Show, St. John, N. B.

April.

April 1- 6—Commercial car show, San Francisco, Cal.
April 5-19—Show, Pittsburg, Penn.

May.

May 5-8—Motor truck run, Washington, D. C.
May 30—500-mile race, Indianapolis, Ind.

June.

June 25-28—Non-stop run, Chicago-Boston.

July.

July 1—Manufacturers' tour, Indianapolis-San Francisco.
July 27-28—Road races, Tacoma, Wash.
July 12—Grand Prix race, Amiens, France.

November.

Nov. 24—Vanderbilt Cup race, Savannah, Ga.
Nov. 26—Grand Prize race, Savannah, Ga.

TO STANDARDIZE RIMS.

Special Meeting of S. A. E. Committee to Be Held in Cincinnati, March 12.

At the recent annual meeting of the Society of Automobile Engineers a committee was appointed to consider an improvement in the rim situation for pneumatic tires. Inasmuch as this committee is a sub-committee or division of the standards committee of the society, the matter of rim standardization will be included in its investigations. The committee will hold a meeting at Cleveland, O., March 12, for the purpose of organization and hearing the views of representatives of some 50 pneumatic tire, wheel rim, steel band and motorcycle manufacturing companies. The following are the members:

Henry Souther, consulting engineer, chairman; H. L. Barton, assistant director of production, General Motors Company; G. G. Behn, executive engineer, Hudson Motor Car Company; T. W. Guthrie, secretary, Standard Welding Company; F. H. Moyer, experimental engineer, Firestone Tire & Rubber Company; C. E. Reddig, engineer, Timken-Detroit Axle Company; W. C. State, mechanical engineer, Goodyear Tire & Rubber Company; J. G. Vincent, chief engineer, Packard Motor Car Company; C. B. Whittelsey, factory manager, United States Tire Company; C. B. Williams, treasurer, Mott Wheel Works.

BUICK AS MOTOR SLEIGH.

New Hampshire Man Successful in Involving Satisfactory Machine for Snow.

An accompanying illustration presents an interesting motor sleigh produced by Virgil D. White, West Ossipee, N. H. The main construction is a regulation Buick automobile, made by the Buick Motor Company, Flint, Mich., for which Mr. White is agent. The machine has

Buick Car Transformed into Motor Sleigh.

been run several hundred miles over deep snow on rough country roads.

The driving mechanism at the rear consists of two wheels on each side, bound by a five-inch endless chain. The two wheels at the extreme rear of the machine take the drive from the engine, while those immediately in front work as loose pulleys to hold the chain out and make a track for the driving members. These forward rear wheels are hung on an independent axle, which is suspended from the body by a very light spring, thus permitting them to ride over the snow. The two axles are held in position by means of adjustable radius rods, which makes it possible to tighten or loosen the chain.

The front construction, or sled, consists of a pair of iron tired wheels attached to runners, by means of two bolts for each. This permits the detachment of the runners in three or four minutes' time, when the car reaches bare ground.

PRINCIPLES OF MOTOR STARTING SYSTEMS.

Defining the Application and Operation of Various Methods of Cranking the Gasoline Engine, Including Electric, Air, Gas and Mechanical.

MOTOR starting and electric lighting systems were among the features of the New York and Chicago shows and interest in these conveniences will be greatly stimulated in the Boston exhibition of pleasure vehicles. The larger number of cars on display will afford the visitor even better opportunity to inspect the latest equipment, some of which is being shown for the first time.

For the benefit of those not familiar with electric motor starters it is explained that in many instances they are combined with the lighting system, and with some provision is made for ignition as well. While they may be divided into a number of classes, and these sub-divided, for convenience and to avoid confusing the reader, they will be dealt with in this discussion as separate or combined units. The electric lighting system is closely related to the motor starter in that the generator or dynamo serves a double purpose in charging the battery, since the current is drawn from the cells for starting as well as for lighting. It is apparent, therefore, that the storage battery is an important factor in starting, and the equipment must include means for maintaining it in a properly charged condition.

Showing Installation of Rushmore Motor Starter—Actuation of Driving Pinion Is by Spring and Magnetic Pull.

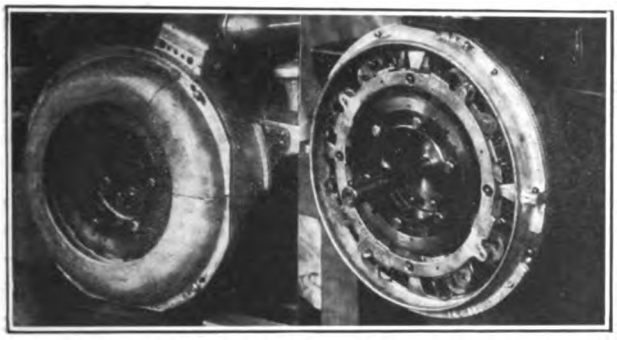
Classes Defined.

In the class designated as separate herein are placed those systems employing the starting motor as a separate unit and in which the storage battery is charged by a generator or dynamo. The combined unit system comprises a combination of the motor and generator, these being utilized alternately for starting and for charging respectively. The system having a motor and storage battery and without means for charging the cells upon the car is not practical, in that its service would be limited, and therefore will not be considered.

There is nothing mysterious about the electric motor utilized nor is the principle new. These methods are employed in many industries for varying purposes; require little if any attention other than lubrication, and seldom give trouble if used properly. Those used on the motor car are of the direct current type and are series wound, a class providing a powerful starting torque, essential to overcome the compression of the gasoline engine. With these motors the speed varies with load changes, increasing as the resistance diminishes and vice versa.

Starting Torque.

This resistance is the same as that experienced when cranking the engine by hand and varies according to the bore and stroke of the cylinders. It is an easy matter to crank a motor having 3.25-inch bore and four-inch stroke, but difficulty may be experienced in turning one with a 4.75-inch bore and six-inch stroke past the compression point. Because of these varying conditions the electric motors employed differ in size.



It is calculated that to crank an ordinary motor, one having a 4.5-inch bore and 5.5-inch stroke for example, takes about one pound torque at a one-foot radius to crank it at 60 revolutions a minute. Tests demonstrate that the minimum of power is required at from 40 to 60 revolutions a minute with a cold motor, and this applies to four as well as six-cylinder units. While the number of revolutions a minute the crankshaft of the gasoline engine is revolved is approximately 60, some designers utilize higher speed rotations, especially where the source of ignition is a magneto and an auxiliary is not fitted for starting. With this type of equipment the crankshaft is rotated at sufficiently high speed to insure efficiency from the magneto.

Current Consumption.

As the electric motor starter depends wholly upon the storage battery, it is evident that its size, characteristics and conditions are important factors. It should be capable of high voltage maintenance, as the torque of a starting motor is

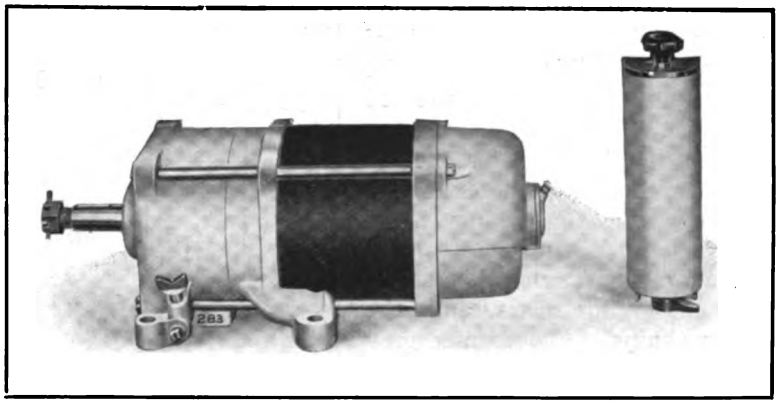
Digitized by Google

dependent to a great degree upon it, and have ability to maintain the output over a long period. Systems of the separate type employ a six-volt

U. S. L. Motor-Generator, a Combined Unit—Showing Casing Removed to Illustrate Components.

battery having at least 120 ampere-hours capacity and the momentary starting rate of these members, the LBA for example, varies from 250 to 450 amperes. A deviation is noted, however, in the Leece-Neville system, which is of the separate type, employing as it does a 12-volt battery. The makers of the Jesco and Wagner, combined units, utilize 12-volt batteries and the starting rates of these (LBA type) vary from 100 to 300. One Jesco combination system makes use of a 16-volt battery, the starting rate of which varies from 100 to 200. In the combined systems fitted to the White and Franklin cars the battery is an 18-volt member having the same rate as the 16-volt equipments.

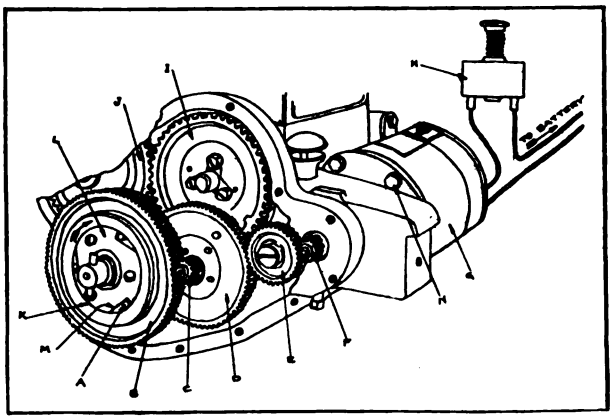
This variation in voltage is accounted for by the difference in the systems; that is, the separate and combined units. The former is series wound, as previously explained, and the windings are coarser than those utilized with the generator. Where the unit is employed both as motor and generator it is evident that a different winding must be utilized when the machine is operating as a motor starter than as a generator. It is noticeable that the makers of combination systems are inclined to use higher voltages, explaining that sparking is thus avoided at the commutator. The advocates of the low voltage system claim that the six-volt is the standard current for lighting and that the utilization of high voltage necessitates the use of special lamps, operating the bulbs in series or dividing the battery. The latter plan is adopted with some equipments, a three-wire system being employed.



By the starting rate is meant the current drawn from the cells when resistance is first encountered by the motor (or the load), and up to and including that of overcoming the compression. This is further explained by comparing it with cranking the engine by hand. In pulling up on the starting crank the resistance gradually increases, the maximum being at the top of the compression stroke, after which it is an easy matter to spin the motor.

Although the drain upon the cells may appear to be considerable, it is only for a brief instant, and current required to spin the engine may be one-quarter, or less, of the maximum. From the above it is evident that the cells should be maintained in a properly charged condition and be given careful attention as pointed out in an article appearing elsewhere in this issue.

Efficiency of Motor Starter.



The length of time an electric motor starter will spin the engine depends upon the capacity and condition of the battery and will vary in practise. Makers claim that their systems will spin the crankshaft for so many minutes or hours, or start the engine a certain number of times. The figures differ considerably and although it is possible to assume theoretically how many starts a system will provide or what distance the car can be operated on the motor starter alone, for practical purposes it is sufficient to know that the system will spin the engine sufficiently long for it to operate under its own power. As the average size gasoline motor will take up its cycle in from two seconds when it is warm, to five seconds when it is cold, it is evident that if it fails to start after several trials the driver should search for the cause of trouble and not continue to drain the battery of current.

The gear ratio between the motor and the crankshaft naturally varies with the size of the engine to be cranked and may be from 15-1 in the case of small motor and 20-1 or more with

Jesco Motor-Generator Unit Constructed in Two Forms and Employing a 12 and 16-Volt Current for Energizing the Electric Motor.

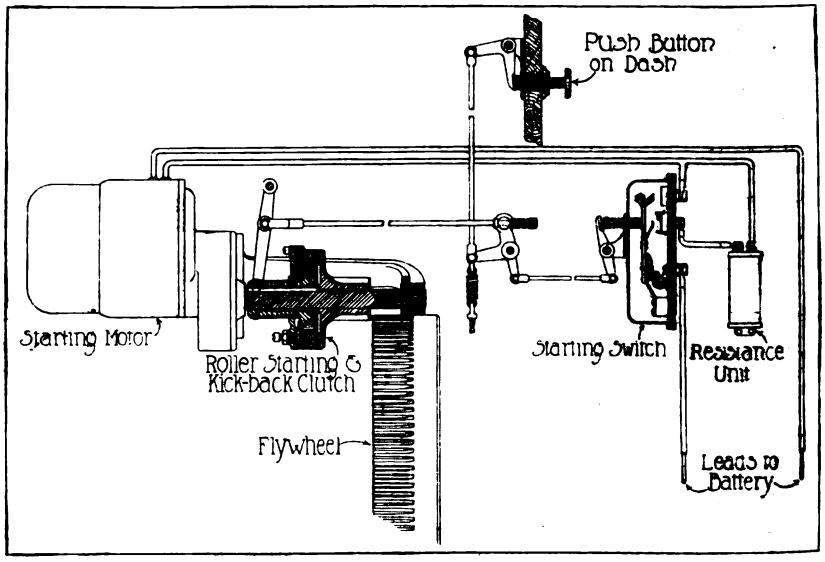
Showing the Application of the Electric Motor Starter on Abbott-Detroit—Note the Gear Reduction Between Electric Unit and Crankshaft.

the large. By proportionating the driving and driven members the crankshaft may be rotated at various speeds, 60 or 100 revolutions a minute for example.

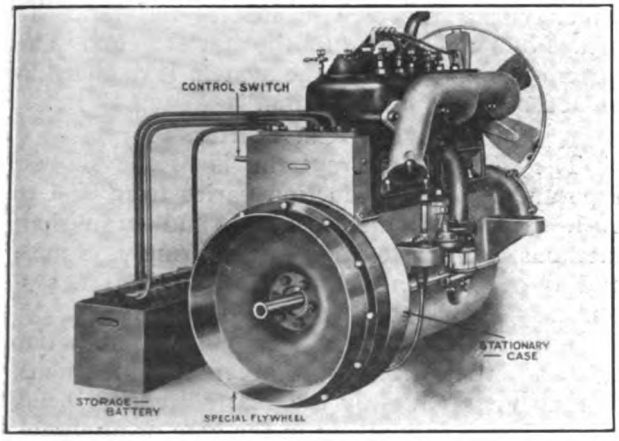
The attaching of the motor starter is a simple matter for the designer of a new car, but on the other hand the application of the unit to standard models involves minor changes in the chassis for the transmission of the energy. Considerable ingenuity is displayed in the latter instance and the various applications are presented in the accompanying illustrations.



Statistics of the New York show, which may be taken as indicative of the situation, reveal the fact that utilizing the geared flywheel is the most popular with designers. Of 69 different cars 39 employed this form, while 13 actuated the crankshaft through the timing gears and 12 imparted the energy to the clutch or crankshaft. Five makers fitted the flywheel system, a combination motor and generator, which replaces the usual flywheel of the engine. This type may be defined as the direct connected starter.

The application of the energy of the electric motor is depicted in accompanying illustrations and it will be noted that there are two general classes, one employing gears and the other chains. The former may be sub-divided into two classes —one in which the driving pinion is thrown into mesh with the geared flywheel of the power plant, and the other in which constantly meshed gears are provided with over-running clutches or similar mechanical devices.

The Gray & Davis system applied to the Lenox car, the Leece-Neville employed on the Haynes, and the Rushmore are conventional illustrations of the type in which the gear is thrown into mesh. By referring to the installation of the Gray & Davis system on the Lenox it will be noted that the large gear driven by the small pinion on the armature shaft of the electric motor carries a shaft on which a small gear is movably mounted. This large gear is provided with an integral jaw clutch which meshes with a similar member on the driving gear. The actuating pedal carries a fork which engages with the movable gear and when the pedal is moved forward the jaw clutches are meshed, as is the gear with the flywheel. As the double contact is made the current from the storage battery is automatically cut in, actuating the armature shaft and train of gears. Resistance is inserted in the first step to make easy the meshing of gears. In the event of a back fire of the motor the jaw clutches are automatically disengaged; in fact, the principle involved is similar to that of the starting crank.



Constant Mesh Types.

The starter utilized on the Abbott-Detroit may be classed in the constant mesh division and employs an over-running clutch. The electric motor is secured to a flange on the crankcase of the gasoline engine and the armature shaft carries a small gear F, which drives through three gears, B, C and D, providing a reduction of 40-1, meaning that the gear F makes 40 revolutions to one of the gear, which is on the crankshaft.

Illustrating the General Plan of the Esterline Motor Starter and Components Utilized for Actuating Flywheel.

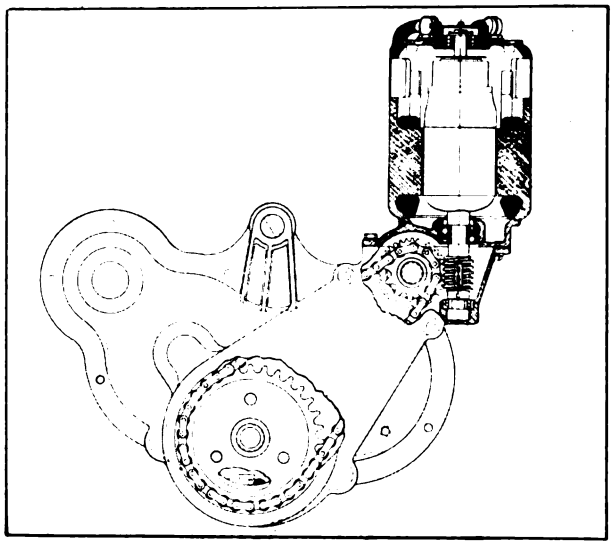
Digitized by Google

The Apico Flywheel Type of Electric Combination System, Showing the Leads to the Battery.

The over-running clutch body L is pinned to the crankshaft and revolves with it when the motor is operating, rotating inside the gear B on the line K and in the direction indicated by the arrow. On the face of the clutch body L are three flat surfaces M cut at an angle to the inside of the gear B, on each of which is a hardened steel roller A, held against the flat surface of the clutch body and inside of the gear by a light spring. The roller travels with the clutch body and runs free against the side of the gear B when the engine is operating and when the starting gears are idle.

The electric motor is energized by depressing a pedal which is practically a switch, in that it closes the connection between the battery and the motor. Drive is through the train of gears to B as previously explained. As the clutch body is idle the rotation of the gear B rolls the three rollers until they are bound between the clutch body and gear, rotating the latter. As the engine speed increases, the gear B is rotating at about 70 revolutions a minute and the clutch body several times this, so that the contact of the rollers is broken. With this system all gears are enclosed and operate in a bath of lubricant.

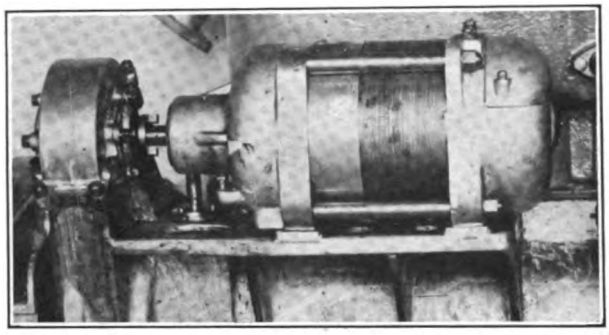
White Combination System.



The White Company employs a combination unit on its product and as will be noted by an accompanying illustration the crankshaft of the engine is rotated through gears enclosed in the forward end of the crankcase and these gears are constantly meshed and operate in oil. The electrical unit operates as a generator for charging the battery, but is also utilized as a motor, in which capacity it serves when a switch is closed. This switch is manually operated.

A chain is employed in the electric motor starting system utilized on the Jackson car and the extension of the armature shaft carries a gear meshing with a similar member to which is secured the driving sprocket. Suitable reduction is secured through proportioning the size of the driving and driven members. The latter is secured to the crankshaft of the engine and has an over-running clutch operating in similar manner to that of the Abbott-Detroit system.

Rushmore System.

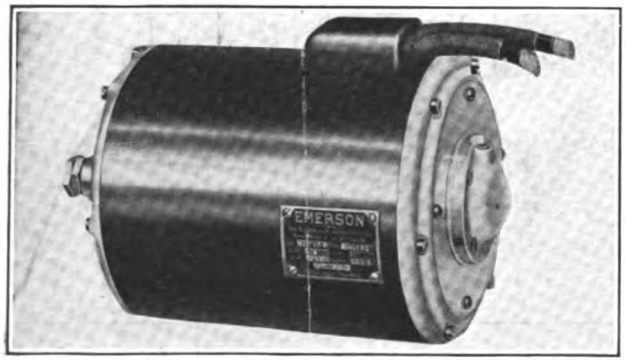


The Rushmore starting system differs from those previously described in the method of meshing with and releasing starting gear. The armature shaft is made longer purposely, the extension being 1.25 inches, and carries a coiled spring which normally moves the armature this distance out of its proper running position in line with the field magnet poles. The principle involved is that of magnetic action and this end pull is utilized to perform the gear shifting.

A series wound motor increases its speed as the load decreases, and with no load would assume high ratios and consume but little current. Without the pinion on the shaft, used with the Rushmore motor, the current would be so small that the field magnets would not hold the armature against the 16-pound push of the spring, but would fly back into a disengaged position when rotating at excessive high ratios. When the pinion is in place, and the motor starts to race, it is held back by the drag or resistance of the engine, and until the latter picks up, the current from the battery, passing through the series field, magnetizes the field so that the armature is held in a working position.

Energy Is Imparted to the Crankshaft of the Jackson Power Plant by Chain to a Sprocket Having an Over-Running Clutch Which Automatically Releases Connection with the Electrical Unit.

Digitized by Google

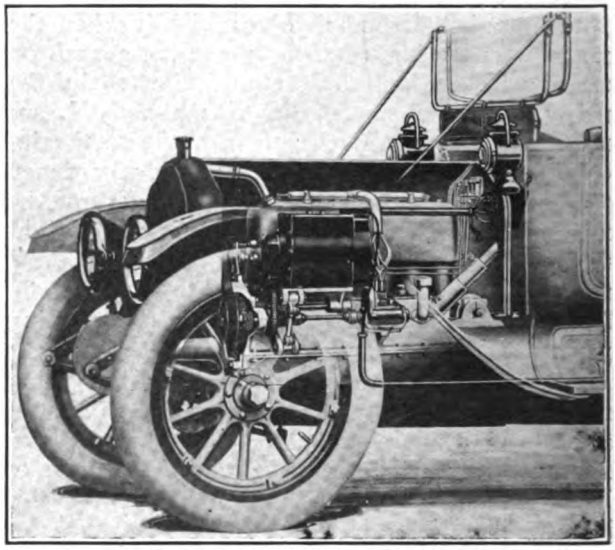


Illustrating the Location of the Aplco Combined Electric Motor-Generator on the Inter-State—The Crankshaft of the Engine Is Actuated by Chain.

Upon the engine beginning to operate it proceeds to drive the electric motor at a very high speed, the battery current falls to almost zero. and as the series field loses its magnetic pull upon the armature, the latter is instantly pushed into a disengaged position by the end spring, stopping when the circuit is broken. The starting switch has several contacts, the first being neutral, and the second causing the field coils alone to become energized. At the second contact the end pull is produced, causing the driving pinion to engage, and the third energizes the armature, which begins to rotate. A small series resistance is interposed between the armature and the third contact. The fourth cuts out all resistance.

Esterline Motor Starter.

The Esterline motor starter is of the separate, six-volt flywheel type and two gear ratios are employed between the motor and the flywheel. The gears are of the double herringbone Weiss type, the pinion of bronze and the gear of high carbon steel. When the speed of the engine exceeds a predetermined number of revolutions, a roller clutch comes into action, disconnecting the electric motor. The operation of the starter is by pressing a push button on the dash,



Emerson Motor Starter, an Exemplification of the Separate Unit Type.

which closes the switch, inserts resistance by means of a coil, and shifts the starter gears. The general arrangement of the system is depicted in an accompanying illustration.

Elyria-Dean Starter.

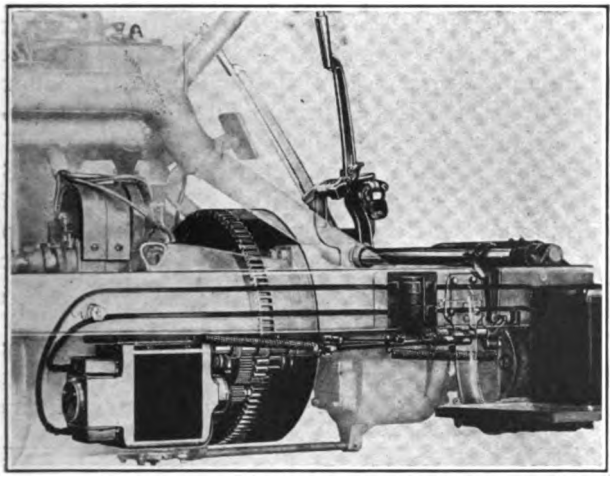
The Elyria-Dean system is of the six-volt type and the gear reduction varies from 35-1 to 20-1, and both the flywheel and crankshaft methods are employed. The gearing is simple and an over-running clutch is utilized. The system may be operated by pedal or lever.

The Leece-Neville starter is a combination unit and differs from those previously mentioned in that operation is by the gear shift lever being moved into a special slot in the gate or quadrant. It is of the flywheel type, a spring being employed to hold the driving pinion out of mesh, and reduction is secured through a train of gears, two being mounted upon a shaft on which the driving pinion slides. Upon moving the gear shift lever into the special slot, the current is cut in and the driving pinion is meshed with the flywheel.

Showing White Electric Motor Starter-Lighting Unit—Energy for Revolving Crankshaft Is by Chain and a Constant Mesh Gear.

A feature of the Jesco device is that the combined starting and lighting system is operated from a single controller, which is usually located between the front seats. One movement of the button connects the battery to the motor and another controls the groups of lights.

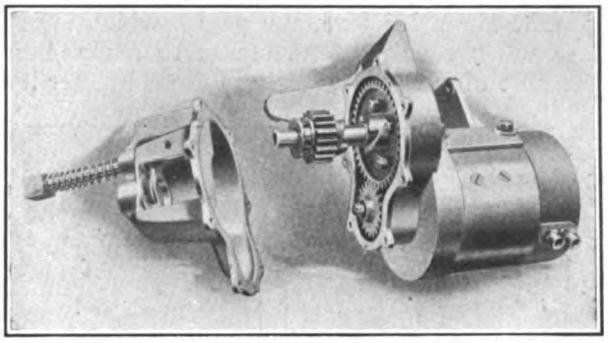
Driving by Chains.



An instance of imparting energy to the crankshaft of the engine by chain is noted on the Inter-State, which is equipped with the Aplco starting and lighting system. The unit is mounted at the rear of the motor and drive is by a silent chain,

Digitized by Google

.5-inch pitch and 1.5 inches wide. The chain is entirely enclosed, the driven sprocket being located on the crankshaft just in front of the flywheel, and operates in a bath of lubricant. The ratio of the sprockets provides a dynamo speed of 1.4-1, but when the unit is employed for starting, the ratio becomes about 50-1 through the internal gear, which is a feature of the Aplco system.

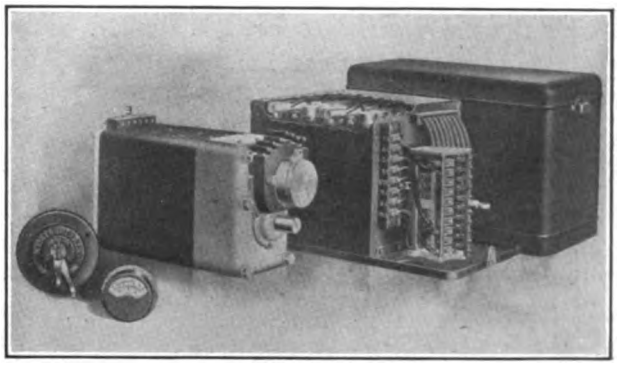


Three-Unit Types.

The Electro starter is of the three-unit type, in that the machine charges the battery, cranks the engine and includes means for ignition. It is a slow speed dynamo driven at crankshaft speed and the gear reduction for starting is automatic. The reduction gear is located in the front casing and the friction principle is employed to compensate for back fires and to prevent the engine

Leece-Neville Electric System Applied to the Haynes Car —The Driving Gear Is Thrown into Mesh with Flywheel by Moving Gear Shift Lever into Special Slot in Gate.

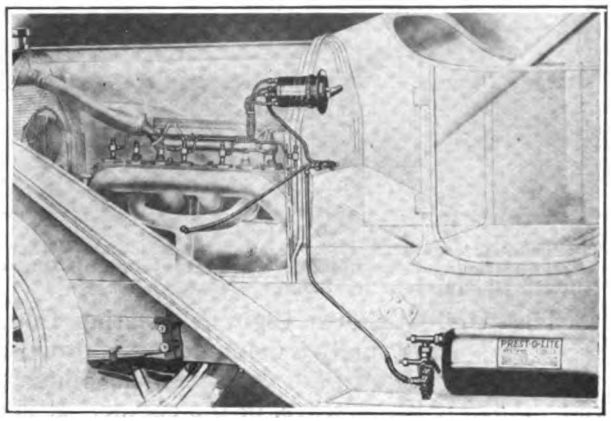
from driving the motor. A fibre faced cone is utilized and a cone ring, the latter having springs so adjusted as to create the proper contact when starting energy is applied. In the event of a back fire the cone simply slips, and the armature immediately carries it over again and contact is remade. It is held that the time of ignition is not affected as the distributor gear is keyed to the drive cone. The advance and retard of the spark is accomplished in the same manner as with the conventional type of magneto. A release operating on the reduction gear permits the engine to take its own speed of rotation after passing the compression point. It is pointed out by the maker that this is an advantage in a starting system in that a higher velocity through the carburetor is assured, producing the same conditions when the engine is rotated at high ratios.



The Gray & Davis Electric Motor Starting Unit Utilized on the Lenox Car—Drive Is Through the Small Pinion with Engagement by Pedal.

The United States Light & Heating Company's system is purely a manufacturer's proposition and as shown in the accompanying illustrations replaces the flywheel of the engine. It is a combination unit, being employed for lighting and starting and the battery is so wired that when connected to the starter it gives a voltage of 24, but when the generator is charging the cells the voltage is 12. This is accomplished by the motor and generator having independent windings, although both are on the armature. When the push switch is operated, a 24-volt current is cut into the motor. Upon the engine starting the motor-generator becomes a shunt wound generator and charges the battery.

Air Systems.



Although the electric motor starter predominates, a number of car manufacturers favor the use of compressed air, among whom is the Pierce-Arrow Motor Car Company. The system is a product of this concern and comprises an air pump on the forward end of the gearbox, a reservoir located horizontally above the muffler on the left hand side of the chassis and a distributor on the motor. The equipment also includes a control lever for bringing the pump into service and a pressure gauge is supplied as well.

A Form of Friction Clutch Is Utilized in the Electro Combined Lighting, Motor Starting and Ignition System to Compensate for Back Firing of the Engine.

Digitized by Google

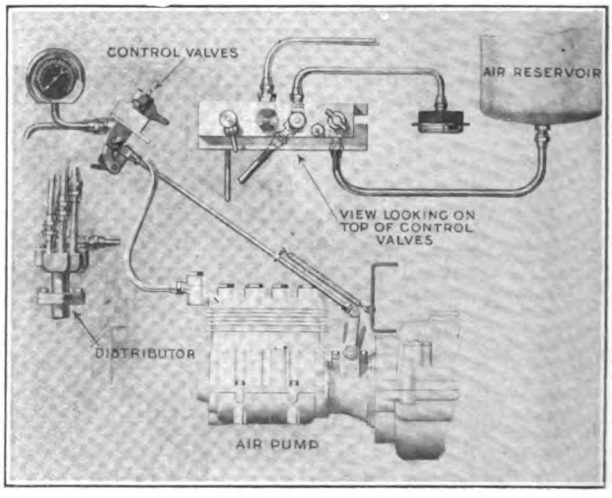
The air is led from the pump, which is utilized when required, and stored to a maximum pressure of 200 pounds. From the container it is

Showing the Components of the Prest-O-Starter, Utilizing Acetylene in Proper Proportions with Air, Ignited by a Spark.

led to the distributor, having a disc and a crescent shaped slot. The supply enters the cover of the distributor centrally and the delivery pipes are attached beneath the disc. As the disc rotates, its slot registers in the firing order of the different cylinders and the air is conveyed by tubing to special constructions having check valves in the cylinder heads.

The Kellogg air starting system comprises a four-cylinder pump driven from the power plant, and the distributor is practically integral with it. A clutch is contained within the distributor case for engaging the pump, and the operating member is conveniently located, being employed when filling of the tank is necessary. The distributor is timed at half engine speed, so that when the engine stops, it is in such position as to allow the air from the tank to flow to the proper cylinder. The admission of air for starting is accomplished by the pressing of a button on the dash. There are several air starters marketed, but the principle upon which they operate is similar.

Acetylene Starters.



The acetylene or gas starters are legion and a description of one will serve to explain their operation, although the application differs. In the Prest-O-Starter gas is led through an automatic reducing valve to the starter pump on the dash, whence it is forced into the cylinders, where the mixture is ignited by a spark. The pump comprises a centre or feed cylinder, surrounded by a series of compression cylinders, equalling the number of motor cylinders. The operation involves a simple out and in stroke, by means of which the gas is drawn in, then forced by compression to the combustion chambers of the motor. A cut-out by-pass valve is included in the equipment and permits operation of the motor on acetylene if desired.

Under the head of mechanical starters may be included a large number of different devices such as those actuated by springs, levers, etc. But one of these was shown on a car at the New York show, if the memory of the writer serves him correctly. There are a number which are fitted to older models and in the main they are designed for motorists who desire a starting system at a moderate price.

Percy Lambert of London, made a new record on the Brooklands track last month when he drove Lord Shrewsbury's 25 horsepower Talbot car 103 miles and 1470 yards within an hour.

The Eisner-Lenk Company, 1074 Boylston street, Boston, Mass., well known in the New England district as distributor for the Eisemann magneto, also has been appointed New England distributor for the Planhard carburetor, made by the Planhard Manufacturing Company, 1784 Broadway, New York City. The Eisner-Lenk display at the Boston show will include a full line of Planhard carburetors, which will be demonstrated to all who make inquiry.

The Rapp Manufacturing Company, Toledo, O., maker of Viso spark plugs, will change its name to the Toledo Spark Plug Manufacturing

The Pierce-Arrow Employs Compressed Air, Which Is Led to a Distributor, Thence to the Cylinders in Proper Firing Order.

Company. Additional factory space will be secured, and it is planned to place a new plug, to be known as the Ohio, in the market in a short time.

AUTOMOBILE CLUB HOLDS TESTS.

Eagleine No-Karbon Oil Wins Enviable Position as Result of Unsolicited Competition.

There is no better gauge of quality than the statements of those who have experience, and the Eagle Oil & Supply Company, 104 Broad street, Boston, Mass., maker of Eagleine No-Karbon automobile oil, maintains that the continued use of this lubricant has demonstrated beyond question the value of a light oil for motor vehicle engines. Eagleine No-Karbon oil is not a new product, but has been manufactured and sold for years with unvarying satisfaction, and before it was offered to the motorists it was carefully tested under all conditions of operation. It was learned from long experiment that it gave results that were surprisingly uniform, and this knowledge was the foundation of the selling campaign inaugurated.

Eagleine No-Karbon oil has been subjected to two competitive chemical tests by a chemist of undoubted ability at the instance of one of the leading automobile clubs of the country, and in these the tests were made by number and not by brand, so that there would be no possibility of any determination other than on the basis of quality. In the first Eagleine No-Karbon was placed as the best adapted for gas engine use, and in the second it was placed first in the "very light" group. These tests were not solicited by the manufacturer, but the first was at the instance of club members who were desirous of learning what would be the best lubricant for their own use. The second was made at the request of manufacturers who were not satisfied with the result of the first and asked that their products be again analyzed.

The specific gravity of Eagleine No-Karbon oil is 31.5 and its viscosity is such that it not only affords splendid lubrication, but the fire test is sufficiently high to insure lubricity and yet the oil is entirely consumed by the explosion, so that there are no unconsumed products remaining in the cylinder. In other words, the oil is of such a character that it is entirely consumed and there are no deposits in the cylinder which harden and are generally known by the name of carbon.

The company believes that those who use oil can realize from the experience of the users of Eagleine No-Karbon oil facts that will be of decided benefit to them, and it has consistently given to those who are desirous of this useful information the names of those who can be depended upon to state their honest convictions. Thousands of letters are at the office of the company, from motorists in all parts of the country, and those who wish can be referred to people living close at hand who can tell from their experience the practical value of Eagleine No-Karbon oil.

SELLING NATIONAL CARS.

Show Salesmen Instructed to Emphasize Machine as a Unit, Not Separate Features.

General Manager George M. Dickson of the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, feels that many visitors at the recent New York and Chicago shows made a mistake in paying too much attention to one or two features when examining the cars on display. In view of the much larger attendance expected at the Boston show he makes the following suggestion:

"It seems that today the main thing people think about in looking over the new models of cars is whether or not these have motor starters. No doubt that one feature is the most looked for. This is all well and good, but I fear that some people lay too much stress upon this one feature and often sacrifice the many other good features by concentrating their attention upon the starters.

"Of course, you may argue that the car that has the best motor starter will perhaps be consistent and be the best car throughout. Take our own case. We sincerely think our electric starter is the best, but I have told our representatives to explain the National as a whole car and not emphasize any one single feature.

"The way to buy a car is to buy it as a unit; buy it with the knowledge in view that it will operate as a whole car satisfactorily for your own needs and desires. I believe that a flexible motor, noiseless operation, comfortable body, ease of control, stability and reliability, the reputation of the builders and, in fact, a hundred other points are just as important as a starter—although I would demand a motor starter if I were a buyer."

Official report has just been made public that the pleasure car sales of the Baker Motor Vehicle Company, Cleveland, maker of Baker electrics, for January, 1913, showed a net increase of 211 per cent. over January, 1912.

MANY SUCCESSFUL DEALER'S SHOWS.

Importance of the Local Display Fully Demonstrated by Attendance and Business Transacted---Two Buildings Necessary for Exhibition in Toronto.

EVERYTHING seems to indicate that this is to be the biggest year in the history of the automobile industry in Canada. Not only are a number of the smaller cities holding shows, following the example set on this side of the line, but the displays in all the important centres are much larger than heretofore, the attendance is much more encouraging and the business transacted is very promising. Montreal only recently experienced its second exhibition within two weeks, and now comes Toronto with two buildings, and both filled to overflowing.

The Toronto show has outgrown successively the St. Lawrence Market and the Armouries, and this year's exhibit was transferred to the Canadian National Exhibition grounds, where it occupied the Transportation and Dominion Government buildings. It was held Feb. 20-March 1, under the direction of the Toronto Automobile Trade Association, the auspices of the Ontario Motor League and the management of E. M. Wilcox.

The setting in each building was arranged to reflect the coming of spring. The general color scheme was white, green and yellow. Baskets of flowers and a liberal use of green foliage and rambler roses were found in the Transportation building, while the Government building was transformed by the utilization of blooming apple and cherry trees, in the branches of which were a number of singing birds.

About 300 cars were on display in the two buildings, these representing the products of Canada, the United States, Great Britain, Italy and France. Pleasure cars, commercial vehicles and accessories were represented as follows:

Pleasure Cars—Russell Motor Car Company, Russell-Knight; Brintnell Motor Car Company, National; Ford Motor Company of Canada, Ford; Automobile & Supply Company, Pierce-Arrow, Chalmers, Paige, Hupmobile; Hyslop Bros., Cadillac; Pope-Hartford Company of Canada, Pope-Hartford; Reo Sales Company, Reo; Standard Motors, Ltd., Mitchell; Matheson Automobile Company of Canada, Matheson, Auburn; Republic Motor Car Company, Republic, Oakland; Tudhope Motor Car Company, Tudhope; Virtue Motor Sales Company, R-C-H; Norwalk Motor Car Company, Norwalk; T. A. Crow, Alco; McLaughlin Motor Car Company, McLaughlin, Fiat; Studebaker Sales Agency, Studebaker; American Motor Sales Company, American; Provincial Motors, Ltd., Cole, Locomobile; J. I. Case Threshing Machine Company, Case; Bouvier & Son, Winton; Jackson Car Company of Ontario, Jackson; Wolseley Tool & Motor Car Company, Wolseley; Keeton Motors, Ltd., Keeton; Cutting Motor Sales Company, Cutting, Chevrolet, Empire, Little; Nyberg Auto Sales Company, Nyberg; Renolds Bros., Straker-Squire; Dominion Automobile Company, Peerless, Stevens-Duryea, Hudson; White Company, White; Canadian Simplex Auto Company, Sheffield-Simplex; Peck Electric, Ltd., Peck electric; Brockville-Atlas Auto Company, Brockville-Atlas; Maxwell-Stoddard Ontario Company, Stutz; Shaw Overland Sales Company, Overland; Universal Electric Economy Company, Buffalo electric; Stepney Motor Wheel Company of Canada, Humber; Tate Electrics, Ltd., Tate electric; Death & Watson, Rauch & Lang electric; Ross Motor Car Company, Regal; Kissel-Kar Sales Company, KisselKar; Gibson Electrics, Ltd., Ohio electric; Ontario Motor Car Company, Packard, Detroit electric; T. Eaton Company, Lozier.

Commercial Vehicles—Albion Motor Car Company of Canada, Albion; Canadian-Fairbanks-Morse Company, Mack; International Harvester Company of America, I. H. C.; Dominion Automobile Company, Autocar; White Company, White; Industrial Motor Trucks, Ltd., Commer; Shaw Overland Sales Company, Gramm; Tate Electrics, Ltd., Tate electric; KisselKar Sales Company, Kissel-Kar; Ontario Motor Car Company, Packard; Brantford Motor Truck Company, Brantford; Northern Motor Car Company, Northern.

Accessories—Auto Tire Company, S. F. Bowser & Co., Bosch Magneto Company, Canadian Oil Companies, Collett-Sumpson Fibre Tire Company, Canadian Consolidated Rubber Company, Cutten & Foster, Croftan Storage Battery Company, Essenkay Sales Company of Toronto, Goodyear Tire & Rubber Company of Canada, Gutta Percha & Rubber, Ltd.; Indian Refining Company, Imperial Oil Company, Independent Tire Company, Percy McBride, McCord Manufacturing Company, Marburg Bros., National Equipment Company, North British Rubber Company, Polock Manufacturing Company, Weed Chain Tire Grip Company, Zimmer Vacuum Machine Company, Zip Company.

TRI-CITY AUTOMOBILE SHOW.

Dealers in Three Cities Combine for Annual Event Held in Davenport, Ia.

The annual Tri-City automobile show in the Coliseum at Davenport, Ia., was held Feb. 18-22, the dealers in Davenport, Ia., Rock Island and Moline, Ill., uniting to make the event a splendid success. Every opportunity was afforded to bring the different models to the attention of the visitors, many of whom came from towns and cities other than those represented by the dealers. The list of exhibitors follows:

Automobiles—Buick Motor Company, Buick, Packard, Hudson; Iowa Auto & Tire Company, Cadillac; Yeggy-Don Sales Company, KisselKar, Knox, Woods electric; Overland Motor Car Company, Overland; Mason's Carriage Works, Pierce-Arrow, Chalmers, Baker electric; Trevor & Snider, Stearns-Knight, Cole, Chicago electric; H. W. Neuman Machine Company, Auburn; Scott County Mercantile Company, Maxwell, Abbott-Detroit, Paige; Inter-State Auto Company, Studebaker; A. J. Ostlund's Garage, Reo; Horst & Streiter Company, Moline; P. C. Peterson Company, Pope-Hartford; C. R. Parker, Case; Williams-McClean Garage Company, Haynes; H. E. Ross Electric Company, Ohio electric; Dennes-Kuttler Machine Company, Franklin; Glenn & Trevor, Great Western; Detroit Electric Car Company, Detroit electric.

Digitized by Google

Motorcycles—Fred J. Barr, Flying Merkel; G. R. Meyers, Indian, Black Hawk.

Accessories—Universal Portland Cement Company, road building materials; Davenport Rubber Company, tires; Positive Tire Vulcanizing Company, tires.

BROOKLYN DISPLAY SUCCESSFUL.

Practically 55,000 People View Cars and Many Sales Are Recorded for Week.

Over 12,000 people witnessed the opening of the third annual show of the Brooklyn Motor Vehicle Dealers' Association in the 23rd Regiment armory, Brooklyn, N. Y., Feb. 22, and the attendance throughout the week was sufficient to bring the grand total to more than 55,000. As was freely predicted previous to the display, the proximity of Brooklyn to the big national show in New York proved no deterrent to the closing of sales. In all respects this third annual exhibition was remarkable for the number of new records created.

Bona fide retail sales were recorded during the first hour after the opening of the doors, the first to report a sale being the Pathfinder agency. This was followed closely by the Hupmobile. Several prospects were secured during this hour, and many of these were closed before the week was over. The attendance was by no means confined to Brooklyn, many people being present from all sections of Long Island, and some even from Manhattan. A full list of the exhibitors was presented in the last issue of The Automobile Journal.

Interior of the 23rd Regiment Armory, Brooklyn, N. Y., During the Progress of the Third Annual Brooklyn Dealer's Show.

MANY CONTRACTS AT ALBANY.

Dealers Considering Plan to Hold Separate Truck Show Another Year.

Everybody appears to be immensely satisfied with the results obtained during the recent show in Albany, N. Y. More than 15,000 people paid to see the display. The dealers report over 100 contracts signed and a large number of others in prospect. So much interest was manifested in the commercial vehicle section that the Albany Automobile Dealers' Association is considering the advisability of holding a two weeks' exhibition next year, the second week to be devoted entirely to motor trucks and their accessories. The event was under the management of Col. C. A. Simmons, and the following made display:

Pleasure Cars—Adirondack Motor Company, Overland; J. J. Aker, Regal, Mitchell; Alco Auto Sales Company, Alco; Albany Garage Company, Simplex, Peerless, White, Chalmers; Albany Rubber Tire Company, Selden; Boulevard Garage Company, Marmon; Buick Motor Company, Buick; Central Auto Company, Knox, Reo, Ford; Congress Auto Company, Nyberg; J. I. Case Threshing Machine Company, Case; Consalus Company, Marion, Premier, Abbott-Detroit; Dominant Motor Company, Packard; Henry Dumary, Jr., S. G. V.; Franklin Automobile Company, Franklin; Jas. N. Kemp Machine Works, Henderson, R-C-H, Metz; Michigan Motor Car Company, Michigan; Miles Garage, Warren; Moyer Auto Sales Company, Moyer; Northern Motor Car Company, Stutz, Apperson; Park Garage Company, KisselKar, National; Pioneer Motor Car Company, Paige; C. S. Ransom, Lozier; W. L. Schupp & Sons, Oldsmobile, Oakland, K-R-I-T; George H. Snyder, Stearns-Knight, Buffalo electric; Sterling Garage, Imperial; E. V. Stratton Company, Hudson, Flanders; Taylor Automobile Company, Locomobile; Troy Automobile Exchange, Pierce-Arrow; Troy Carriage Works, Speedwell, Rauch & Lang electric; C. F. Weeber Manufacturing Works, Haynes, Studebaker; W. M. Whitney & Co., Fiat, Cadillac; Wilbur Auto Sales Company, Cole; Wayne P. Zenk, Pullman.

Commercial Vehicles—Alco Auto Sales Company, Alco; Albany Garage Company, White, Stewart; Albany Rubber Tire Company, Selden; Central Auto Company, Knox, Reo, Adams; Dominant Motor Company, Packard; International Motor Company, Mack, Saurer; Park Garage Company, KisselKar; W. L. Schupp & Sons, Federal; Troy Automobile Exchange, Pierce-Arrow, Lippard-Stewart.

Motorcycles—Normanskill Motor Shop, R-S; Weeber Cycle Works, Indian, Thor.

Accessories—Albany Welding Shop, welding; Albany Vulcanizing Works, tires; Albany Spring Wheel Company, wheels; Albany Hardware & Iron Company, supplies; Austin & Co., insurance; Babbitt & Co., clothing; K. E. Bender, electric supplies; Central Vulcanizing

Works, tires; Cox Brass Mfg. Co., brass goods and windshields; F. E. Colwell & Co., cameras; Dolan Company, clothing; Empire Essenkay Company, tire filler; John Fuhrman, clocks, etc.; James Goold Company, bodies and wheels; A. R. Justice Company, polishes; Jas. N. Kemp Machine Works, portable garages; Kingsbury-Leahy Company, body sundries; Kupke's Auto School; Chas. E. Miller, general line; Mohawk Welding Company, welding; Meyer Bros., ivory novelties; Post-Lester Company, general line; Rose & Kiernan, insurance; B. Snowden, motor; Standard Oil Company, lubricants; Steefel Bros., clothing; Troy Spring Works, springs; Chas. H. Turner Company, general line; E. Q. Williams, spark plugs.

NEW CARS AT PITTSBURG.

Third Annual Exposition Display Remarkable for Number of Lines Revealed.

The value of the national show as an exhibition at which to bring new products to the attention of the public appears to have been discounted by those who made display at the third annual dealer's show in the Exposition building, Pittsburg, Penn., under the management of Thomas I. Cochran, March 1-8. No less than five trucks and one pleasure car were shown here for the first time at any exhibition. These were the E. P. E. electric truck, Lange, Dart, Shelton and Curtis gasoline commercial vehicles and the Duquesne pleasure car.

Thomas I. Cochran, Manager, Pittsburg Automobile Show.

The interior of the building was completely transformed for the event, and the decorative scheme was thoroughly in keeping with the importance of the display. It must be remembered that Pittsburg is the business centre for a wide area, embracing western Pennsylvania, eastern Ohio and West Virginia, comprising a population which may roughly be estimated at 5,000,000. And it may be added that the report as to attendance is such as to indicate that the people in this territory contributed their full share toward the success of the venture.

Mr. Cochran has achieved an enviable reputation as a show manager, largely because of his success with previous automobile displays in Pittsburg. In the present exhibition he was assisted by the following committee of local dealers: President Elias Lange, Vice President W. M. Laird, Treasurer E. A. Williams, Secretary James D. White, C. C. Laughner, F. J. Curtis, Aaron Deroy, Alfred A. Buhl, J. M. McClarren. The list of exhibitors follows:

Pleasure Cars—Alco-Pittsburg Sales Company, Alco, Abbott-Detroit Company, Abbott-Detroit; Aupke Bros., Enger; Buhl Regal Car Company, Regal; Cole Motor Car Company, Cole; Aaron Deroy Motor Car Company, Studebaker; Duquesne Motor Car Company, Duquesne; Forbes Motor Car Company, Stutz, Henderson; General Auto Company, Knox; Kline-Kar Motor Company, Kline-Kar; Locomobile Company of America, Locomobile; Manchester Garage Company, Staver; Martin & Coulter, G. J. G.; Michigan Auto Company, Michigan; McKeesport & Clairton Transportation Company, Haynes; McCurdy-May Company, Pierce-Arrow; Neighbors Motor Car Company, Hupmobile; Ohio Motor Sales Company, Ohio; Penn Auto Company, Alpena; Pittsburg Motor Sales Company, Marathon; Pullman Auto Company, Pullman, Marion; Schacht Motor Car Company, Schacht; Williams-Hasley Motor Car Company, Mitchell, Empire.

Commercial Vehicles—Alco-Pittsburg Sales Company, Alco, Stewart; Cartney Bros., Indiana; Chicago Pneumatic Tool Company, Little Giant; Aaron Deroy Motor Car Company, B. F. Gramm, Bessemer; Elwell Parker Electric Company, E. P. E.; General Auto Company, Knox; International Harvester Company, I. H. C.; Lange Motor Car Company, Lange; Locomobile Company of America, Locomobile; Martin & Coulter, Dart, Shelton; McCurdy-May Company, Pierce-Arrow; Neighbors Motor Car Company, Hupmobile; Ohio Motor Sales Company, Ohio; Pittsburgh Machine Tool Company, Curtis; Schacht Motor Car Company, Schacht; Taylor Motor Car Company, Lippard-Stewart; Vulcan Service Motor Truck Company, Vulcan, Service; West Penn Auto Company, Kelly, Chase.

Accessories—Atlantic Refining Company, Air Tight Sheet & Tank Company, Automobile Accessories Company, W. H. Bradley, Jr., Buffalo Specialty Company, A. J. Dempsey, Doubleday Hill Company, Dyke Bros., S. C. Hamilton, Hipwell Manufacturing Company, Hoover & Hurst, Iron City Spring Company, Jackson Motor Supply Company, Keystone Motor Supply Company, Murray Manufacturing Company, McCreery & Co., Harry L. Neff, Clarence N. Peacock & Co., Pittsburg Auto Equipment Company, Pittsburg Rubber Company, Perfection Tube Sales Company, Joseph B. Roberts, Ruby Manufacturing Company, John I. Shaw, Tobin Whichway Signal Company, Union Top Manufacturing Company, Van Deman & Wainright, Joseph Woodwell Company, Williams & Co., Wayne Oil Tank & Pump Company.

THIRD ANNUAL IN ELMIRA.

Largest in Number of Exhibits, Attendance and Sales Yet Held in That City.

The third annual show under the auspices of the Elmira Automobile Club was held in the state armory, Elmira, N. Y., Feb. 24-March 1. It was the largest display, measured by number of exhibits, that the city has seen, and the attendance and business transacted was in like proportion. The event was held under the management of M. D. Marks, assisted by the following committee: M. R. Ellis, F. C. Ogden, F. M. Jones, A. W. LaFrance, G. W. Shoemaker and George Middleton. Those who made display were:

LaFrance Garage Company, Southern Tier Motor Company, Wolcott Motor Company, American-LaFrance Fire

Digitized by Google

Engine Company, Genesee Motor Company, Elmira Ford Company, Charles W. Bishop Company, T. Wrayburn Keeton, John F. Rhodes, Hudson Motor Company, J. Bruce Bishop, A. J. Strong, D. S. Andrus & Co., Fenton E. Weaver, Geneva Automobile Company, Gaines Automobile Company, Elmira Arms Company, F. E. Tomlinson, W. B. Hallock & Bro., P. H. Rattan, George Ells, Sheehan, Dean & Co., Marsden Gerity, Atterbury Truck Company, L. L. Laskaris, Myer Bros., Hoover Vacuum Cleaning Company.

SALES IN NEW ORLEANS.

Increased Number of Exhibitors Enjoyed Good Business at Third Annual Show.

Col. T. C. Campbell, manager of the third annual show of the automobile dealers in New Orleans, La., which was held in Washington Artillery hall, Feb. 19-24, is authority for the statement that the keenest rivalry was experienced among the various exhibitors. In many respects it was the largest display of this character that has been held in that section, the list of cars shown being much larger than heretofore. The interior of the hall was decorated in true southern style, smilax and palms playing a prominent part in the general scheme. The exhibitors were:

Automobiles—White Company, White; Oakland Motor Company, Oakland; Russell Automobile Company, Ford; Joseph Schwartz & Co., Buick, Premier, Adams truck; Abbott Automobile Company, Packard, Baker electric; H. A. Testard, Hudson; Lyons-Barton Motor Car Company, Pierce-Arrow; Fairchild Auto Company, Peerless, Reo; S. D. Hogue, Overland; G. D. Revol, Cadillac; Auto & Garage Company, Marion; J. A. Landry Motor Car Company, Michigan; Demack Motor Car Company, Haynes, Knox; M. Zilbermann, K-R-I-T; Cooke Auto & Taxi Company, Locomobile; Gulf Motor Company, Rambler, Winton; Woodward, Wright & Co., Mack and Saurer trucks; Portable Sawmill Company, Case; Thompson & Edwards, Pullman, Little; Hood Motor Company, American, Regal; Louisiana Motor Car Company, Stearns-Knight; T. Sidney Weber, Paige, Garford, Halladay; Chalmers Motor Company, Chalmers; R-C-H Sales Company, R-C-H; Automobile Maintenance Company, Locomobile, Cartercar, Mitchell.

Sundries—Chas. E. Miller, accessories; Electric Appliance Company, electrical supplies; Southern Hardware & Woodstock Company, supplies; Shuler Rubber & Supply Company, tires; Standard Oil Company, lubricants; M. Zilbermann, Indian motorcycles.

ATTENDANCE IN NEW HAVEN.

Business of the Week Such as to Indicate That Interest Is Well Maintained.

With increased attendance and a decidedly larger number of sales, the third annual dealer's show in the Second Regiment armory, New Haven, Conn., came to a close March 1. The event was under the management of William Lindsley. Yellow and white bunting and hundreds of electric lights combined with lattice work in transforming the interior of the building for the occasion. The exhibitors of cars follow:

George B. Wuestefeld, Pierce-Arrow; Ray L. Bishop, Hupmobile; N. L. Biever, Maxwell, Commerce truck; Russell Howard, KisselKar, Metz; M. J. Gibbud, Nyberg; C. O. Rischert, Haynes; H. M. Buzzard, Ford; Cowles Tolman, Franklin, R-C-H; N. B. Whitfield, Overland, Apperson; Charles Lee, Detroit electric; Wilbut A. Maynard, Packard; David Currie, Schacht.

BIG SHOW IN OMAHA.

Dealers and Manufacturers Unite in Important Display in Nebraska's Capital.

In past years the Omaha Automobile Show Association has been content to use just enough decorations to relieve the barren appearance of the Auditorium, where the annual show has been held, but this year the interior of the building was treated in an elaborate manner. The prevailing color scheme was green, although streamers and bunting reflected the colors of the association and served to aid in carrying out the general plan. Thousands of electric lights also were used with splendid effect.

Clark G. Powell, Manager, Omaha Automobile Show.

The show opened Feb. 24 and continued throughout the week. General Manager C. G. Powell spent some little time in Chicago during the recent national exhibition in that city and as a result manufacturers assisted local dealers by sending several of the machines seen there for presentation in Omaha. The business transacted was quite in keeping with that of former years. The list of exhibitors follows:

Apperson Jack Rabbit Auto Company, Bradley, Merriam & Smith, Cadillac Company of Omaha, Cartercar Company, Cole Motor Company, John Deere Plow Company, Doty & Hathaway, Droge Auto Company, Drummond Motor Company, Electric Garage Company, Ford Motor Company, Frederickson Auto Company, Freeland Auto Company, Houser & Howes, W. L. Huffman Auto Company, Inter-State Automobile Company, Independent Auto Sales Company, Johnson-Danforth Company, Lininger Implement Company, Marion Auto Company, Michigan Auto Company, Andrew Murphy & Sons, Mitchell Motor Company, Moline Auto Company, Nebraska-Buick Auto Company, T. G. Northwell Company, Omaha Auburn Auto Company, Orr Motor Sales Company, Paige Company of Nebraska, Pioneer Implement Company, Rambler

Digitized by Google

Motor Company, Jack Sharp, Guy L. Smith, Studebaker Corporation, Traynor Auto Company, Van Brunt Auto Company, Wallace Auto Company, Western Auto Sales & Manufacturing Company, E. R. Wilson Auto Company, Anderson Coupling & Fire Supply Company, International Harvester Company, Nebraska Cycle Company, Omaha Bicycle Company, Powell Supply Company, R-S Motorcycle Company, Victor H. Roose, Baum Iron Company, Omaha Rubber Company, E. W. Reynolds Manufacturing Company, Arthur Stors Auto Supply Company, Western Auto Supply Company.

The following vehicles were represented:

Pleasure Cars—Abbott-Detroit, Alco, Apperson, Auburn, Baker electric, Buick, Cadillac, Cartercar, Case, Chalmers, Chevrolet, Cole, Detroit electric, Detroiter, Empire, Ford, Franklin, Firestone-Columbus, Glide, Great Western, Haynes, Hudson, Hupmobile, Hupp-Yeats electric, Imperial, Inter-State, Jackson, Lexington, Little, Lozier, Lambert, Locomobile, Marion, Marmon, Michigan, Mitchell, Moline, Mason, Midland, National, Oakland, Ohio electric, Overland, Packard, Peerless, Pierce-Arrow, Pope-Hartford, Paige, R-C-H, Rambler, Rauch & Lang electric, Regal, Reo, Stearns-Knight, Stevens-Duryea, Studebaker, Standard electric, Velie, Woods electric.

Commercial Vehicles—Alco, Avery, Buick, Chase, Commerce, Detroit electric, G. M. C., G. V. electric, Hupmobile, International, Kelly-Springfield, Mason, Packard, Reo, Studebaker, Velie.

Motorcycles—Excelsior, Harley-Davidson, Henderson, Indian, Merkel, Pierce, R-S, Thor, Yale.

PORTLAND'S SECOND SHOW.

Eighth Annual Event Under Management of F. M. Prescott Follows Dealers' Display.

Portland, Me., is one of the cities to hold two automobile displays this year. The first was under the auspices of the Portland Automobile Dealers' Association, while the second was the eighth annual event under the management of F. M. Prescott. Both were held in the new City Hall auditorium, the latter during the week of Feb. 18-25.

The decorations were simple and attractive. About the walls, a lattice work covered with roses and greenery served as a screen, while the same effect was carried out through the main portion of the structure. The attendance was quite as large as during the first show and the amount of business transacted was of similar proportions. The list of exhibitors follows:

Automobiles—Abbott-Detroit Motor Car Company, Abbott-Detroit; Apperson Auto Company, Apperson; Metz & Paterson Garage, Metz, Paterson; Eastern Sales Company, Haynes, White; J. H. McDonald, Overland, Garford; Bath Garage Company, Cutting; O. F. Morris, Jackson; Fred Morse, R-C-H; John Lewis, Hupmobile; George E. Morrison Auto Company, Chase truck; Nelke & Partridge, Winton; Sanborn Motor Company, Stutz; Michigan Motor Company of Portland, Michigan; Regal Motor Car Company, Regal; Henderson Motor Company, Henderson; Imperial Motor Car Company, Imperial; Marion Motor Car Company, Marion, Great Western, Brown truck; Maine Power Truck Company, Stewart truck; J. E. Stephens, Reo; Guy W. Lawrence, Lozier.

Sundries—H. R. Sutton, Thirty-Five Per Cent. Automobile Supply Company, Converse Rubber Company, York & Boothby, Larrabee Electric Company, L. W. Cleveland Company, James Bailey Company, Yeuell Manufacturing Company, Wayne Oil Tank & Pump Company, O. P. Peterson, J. D. Ross, Herist & Towle Company, Cogum Tire Filler, Underwood Springs Corporation.

TOPEKA DEALERS SUCCESSFUL.

They Hold Their First Annual Show Under Circumstances Indicating Continuation.

The Topeka Motor Car Dealers' Association held its first annual show in the City Auditorium, Topeka, Kan., Feb. 24-March 1, under the management of J. S. Warner and W. H. Imes, president and secretary, respectively. The results, particularly in a business way, were such as to indicate that the event will become a regular feature in the activities of the organization. The exhibitors were confined to the dealers located in Topeka and included the following:

Overland Company, Capital Auto & Supply Company, J. A. R. Motor Car Company, West Motor Car Company, Nicholas Auto Company, Imes-Clark Motor Car Company, Stevens & Sons, Hupmobile Motor Company, Cole Motor Company, J. F. Billings Auto Company, J. R. Johnson Motor Company, E. G. Kinley, Seery & Morton, Jesse, Kirkpatrick & Kirkpatrick, J. C. Harding Motor Cycle Company, Excelsior Motor Cycle Company, Central Cycle Company, Shawnee Motor Cycle Company.

The following cars were displayed:

Jackson, Rambler, Auburn, Studebaker, Glide, Hudson, Chalmers, Paige, Detroit electric, Buick, Inter-State, Mitchell, Overland, Velie, Maxwell, Oakland, Cadillac, Stafford, Stoddard-Dayton, Cole, Ford, I. H. C., Hupmobile, Reo, Marion.

TEN DAYS IN CINCINNATI.

National Circuit Show of Pleasure Vehicles to Be Followed by Motor Truck Display.

One of the 10 cities selected by the National Association of Automobile Manufacturers for the national circuit of 1913, Cincinnati, O., had been looking forward with pleasant anticipation to the annual display of the Cincinnati Automobile Dealers' Association, which opened in Music hall, Feb. 24. The show covered a period of 10 days, the exhibition of pleasure vehicles being followed by a special event for commercial cars. There were 52 exhibitors for the first week and 16 for the motor truck section, as follows:

Pleasure Cars—Leyman-Buick Company, Buick; Kruse Motor Car Company, Marmon; Cincinnati Automobile Company, Pope-Hartford; Hanauer Automobile Company, Pierce-Arrow; Citizens' Motor Car Company, Packard; Welbon Motor Car Company, Hudson, R-C-H; Herschede Motor Car Company, Rauch & Lang electric; Charles Behlen's Sons, Locomobile, Detroit electric; Kentucky Motor Car Company, Oakland; Imperial Motor Car Company, Stearns-Knight, Cole, Baker electric; Fischer Auto & Service Company, Fiat, Chalmers, Speedwell; Jungclas Auto Company, Overland; Ratterman Motor Car Company, K-R-I-T; Progressive Garage, Pathfinder; Schacht Motor Car Company, Schacht; Charles Schlear Motor Car Company, Hupmobile, Apperson; Ford Motor Car Company, Ford; Towle Cadillac Company, Cadillac; George C. Miller's Sons, Stevens-Duryea; Payne Motor Car Company, Paige, Herreshoff; Franklin Automobile Company, Franklin; Helman Motor Car Company, Haynes, Regal; Herold Motor Car Company, Premier; Peters & Kleding,

Alco; Commercial Motor Sales Company, Michigan, Empire; White Motor Car Company, White; J. Ostrander, Peerless; Crescent Motor Car Company, Ohio; H. E. Langdon, McFarlan; L. C. Denison, Winton, Abbott-Detroit; Rose Hill Garage, Mitchell, Ohio electric; Model Garage, Nyberg; H. J. Groesbeck, Chadwick; Eddy Auto Company, Case, Dorris; Rambler Motor Car Company, Rambler; Western Motor Car Company, Havers, Lozier; Hupp-Yeats Electric Car Company, Hupp-Yeats electric.

Commercial Vehicles—Kruse Motor Car Company, United States; Cincinnati Automobile Company, Pope-Hartford; Hanauer Automobile Company, Pierce-Arrow; Citizens' Motor Car Company, Packard; Charles Behlen's Sons, Detroit electric; Schacht Motor Car Company, Schacht; Herold Motor Car Company, Reo; Peters & Kieding, Alco; Commercial Motor Sales Company, Lippard-Stewart, Smith-Milwaukee; White Motor Car Company, White; J. Ostrander, Peerless; Armleder & Co., Armleder, International; Miller, Duhrul & Peters, Avery.

Sundries—Moore Oil Company, oils and greases; Paragon Refining Company, lubricants and tanks; Aull-Sides-Clean Company, polishes; Indian Refining Company, Havoline oils; Ideal Steel Wheel Company, wheels; Tire Interlining Company, tire linings and treads; Bumiller-Remelin Company, Indian motorcycles; E. M. Henderson, shock absorber; Ferd Stenger, motorcycles; Miami Vulcanizing & Rubber Company, tire repairs and vulcanizing; H. W. Johns-Manville Company, brake linings; Standard Oil Company, oils and greases.

AN ATTRACTIVE SETTING.

Dealers in Paterson, N. J., Hold Their Second Show in Southern California Garden.

When the big crowd of visitors reached the Fifth Regiment armory in Paterson, N. J., at the opening of the second annual show of the Paterson Automobile Trade Association, Feb. 25, they were confronted with one of the most beautiful settings that has been attempted in the East, the interior of the building having been transformed into a southern California garden. According to those in charge of the display two new records were established, one in attendance and the other in the number of sales.

The event was under the direction of the following special committees: General, President E. A. Browne, Vice President Thomas Hughes, Secretary Harry McGinley, Treasurer G. M. Dorwort; music, Edward Dunn, Robert Bates; floor and space, Thomas Hughes, E. A. Cooper, Edward Dunn; printing, Harry McGinley, Vernon Ettinger, Charles Feagles; decorations, G. M. Dorwort, Harry McGinley, M. Weinstein.

Among the machines shown was the National, with which Joseph Dawson won the international sweepstakes race on the Indianapolis speedway last Memorial Day. The list of exhibitors:

Automobiles—Cunningham Bros., Havers; Paterson Garage Company, Hupmobile; E. A. Browne Company, National, Henderson, Paige, Cadillac; Oldsmobile Company of New York, Oldsmobile; Sheely Motor Company, Moon; H. Lund Smith, Pullman; Edward K. Hunt, Stewart truck; Vernon Ettinger, Michigan; W. H. May, Empire; H. L. Merrick, Detroiter; Silk City Garage, Metz; Ford Auto Company, Ford, Cole; City Hall Garage, Marion, American; Centre Garage Company, Overland; Hughes Garage Company, Franklin, Alco, Buick; Auto Shop Company, Stevens-Duryea; E. A. Peterson, Studebaker; Standard Auto Company, Fiat, Nyberg; Oakland Motor Company, Michigan, Oakland; N. Finch, Lozier; Paterson Vehicle Company, Chalmers; Passaic Auto Company, Premier, Reo; Foly Motor Car Company, Hudson; Chicago Pneumatic Tool Company, Little Giant truck; W. R. Schoonmaker, Stutz; J. Ackerman, Moyer, Brockway truck; Bridge Garage Company, Abbott-Detroit.

Sundries—James Madden, insurance; H. Lund Smith, supplies; John P. Dean, fire extinguishers; Myer Bros., novelties; Standard Oil Company, lubricants; Taylor Manufacturing Company, garages; Fred D. Harrison, polishes; Proskey's Real Estate Agency, insurance; J. Chester Messenger, accessories; A. G. Arthur, tires; National Rim Company, rims; Coffin Rubber Company, tires; North Jersey Automobile Club.

MILLER'S PARCEL POST.

Results from Original Announcement Warrant Establishment of Separate Departments.

"My announcement of delivering automobile supplies by parcel post, free of postal charge, to any city or residence, or on any rural route in the United States," says Chas. E. Miller, 97-103 Reade street, New York City, who conducts the largest automobile supply house in America with branches in Brooklyn, Detroit, Springfield, Philadelphia, Buffalo, New Orleans, Boston, Albany, Newark, N. J.; Hartford, Conn., and Atlanta, Ga., "has created such an interest and has resulted in such a large number of orders that I have organized a special department for my parcel post business. My idea in establishing this department is to increase our trade with people who live at a great distance from New York and who want to purchase first class goods at New York prices.

"Hence, all they have to do is to write to us for quotations on anything in our catalogue and we will quote a price delivered in the city from which the inquiry comes. Our catalogue, of course, is mailed free on request. By motoring supplies I mean not only equipment for motor cars, but for motorcycles, motor boats and aeroplanes. We use the phrase 'Pioneer Jobber,' because our business was established in 1896 and naturally we have added to it with the growth of the motor industry and its various uses."

The Invader Oil Company, New York City, the Boston branch of which is located at 284 Columbus avenue, will occupy spaces 409 and 410 at the Boston show, where will be exhibited a full line of Invader oils and greases, including the I-O-C gear oil, which is claimed to be the only oil ever manufactured especially and exclusively for automobile transmission gears. The display will show the oils themselves and the trade marked cans and packages in which they are sold.

MAKING DISTRIBUTOR TERMINALS.

The breaking of distributor terminals is not uncommon as these members are constructed of a hard insulating material which is broken easily. It is often difficult to secure the proper size terminal to replace the damaged member, it depending upon the make of magneto, etc.

In rewiring the car a workman spoiled one of these terminals and being unable to secure one from the local supply house manufactured one from a piece of fibre and a cotter pin. A piece of one-inch square fibre was chucked in a four-jaw lathe chuck and turned down to the outside diameter of the old connection.

After calipering the new cable a hole was drilled about two-thirds the length in the fibre and of slightly less diameter than the wire. A cotter pin was next fitted to the distributor plate of the magneto and a hole drilled in the other end of the fibre block to take the pin. The cable was next stripped and the exposed wire passed through the eye of the cotter pin and soldered. By twisting the cable into the large opening the pin was slipped through the small aperture and the wire held securely. The repair pleased the owner of the car so well that a new terminal was not ordered.

SOLDERING ALUMINUM.

In soldering aluminum difficulty is encountered in getting beneath the slight film of oxide which forms over the surface of the metal and which is caused by exposure to the air. The oxide is the same color as the metal and cannot be distinguished easily. The object sought is to get underneath this oxide while the surface is covered with the molten solder. Remove all dirt and grease with benzine, apply the solder with a copper bit, and when the molten solder is covering the surface of the metal, scratch through it with a steel wire scratch brush. This will break up the oxide underneath the solder, which containing its own flux, takes up the oxide and enables the surface of the aluminum to be tinned properly.

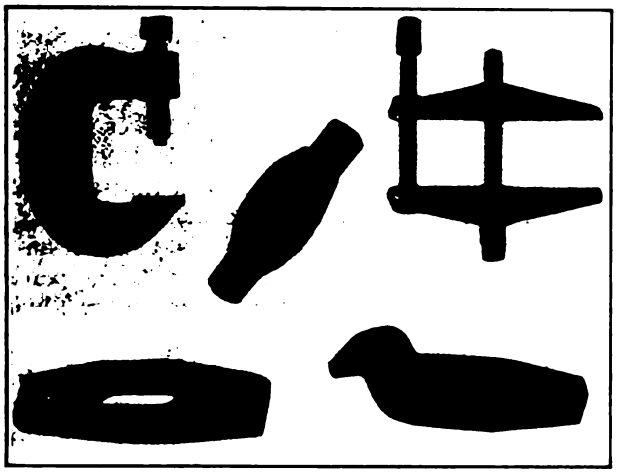
HARDENING LATHE CENTRES.

In hardening lathe centres the point of centre should be heated to a bright red, then cooled in clean, cold water. After it becomes cold it should be withdrawn and the dirt removed so that the color may be noted. One maker of machinery recommends that centres be drawn to a light straw color. Care should be taken not to heat the centre very far back, as it is liable to become sprung.

A PATTERN HINT.

All metal patterns should be thoroughly cleaned with a stiff brush, then coated with a brush having plenty of beeswax in it and dipped in powdered plumbago. Brush the pattern well and it will draw much better and a smoother casting will be the result.

IMPROPER USE OF REAMERS.



A reamer should never be employed to ream out a pipe of any kind. The scale inside the tubing caused by the flux used in welding or brazing is as hard as glass, and no reamer can be made hard enough to cut it.

GARAGE AND REPAIR SHOP EQUIPMENT.

VULCAN DROP FORGED CLAMPS.

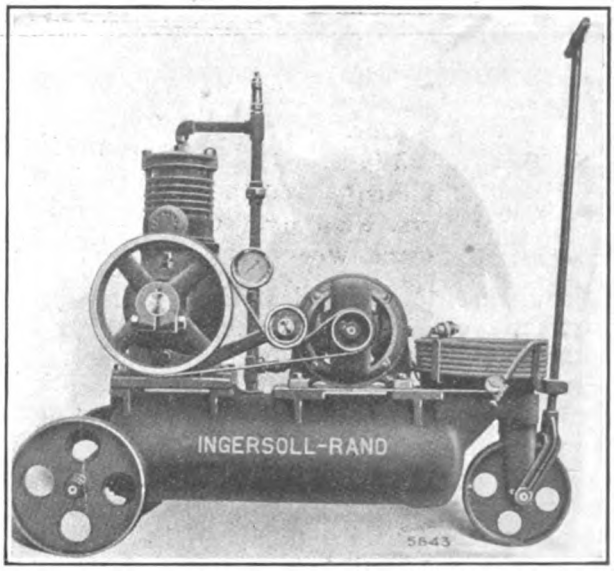
Steel clamps for holding work on drill press tables or surface plates are very handy tools in the repair shop. J. H. Williams & Co., 40 South Clinton street, Chicago, is marketing a line of drop forged clamps known as the Vulcan and these are produced in a variety of forms to meet the requirements of different service. Several of the line produced by this company are shown in the accompanying illustration, including a machinist's clamp.

Vulcan Drop Forged Machinist's and Strap Clamps.

The last named type is constructed from a tough grade of steel which is submitted to a special process to increase strength. The knurled portion of the hardened and tempered screws permits of rapid and easy adjustment. They are made in three sizes having openings from 1.25 to 4.25 inches and are moderately priced.

The company also produces a number of drop forged strap clamps, time saving devices, for use with the planer, lathe, drill press, milling and boring machines.

INGERSOLL-RAND COMPRESSOR.



Many applications of compressed air are possible in the garage or service station and among the uses to which it may be put are: Inflating tires, cleaning tops and bodies, operating small pneumatic tools, etc. The Ingersoll-Rand Company, 11 Broadway, New York City, makes a specialty of air compressors, one of which is shown herewith.

It is of the portable vertical type, operated by an electric motor, and is single acting. It has a bore of 2.5 inches and stroke of three and has a capacity of 3.8-6 cubic feet. The horsepower is .76-1.5 based on 100 pounds pressure with revolutions a minute of 450-700. The inlet valve is a large annular port in the cylinder, while the outlet is a single plate in the top of the cylinder. Lubrication is by the constant level splash system and the bearings are removable bronze members. The length overall is 50 inches, width 24 and height from floor 48.

Drive is by a short belt from either two or three-phase, 60-cycle, alternating current motors of 110, 220 or 440 volts. Direct current motors are supplied of 110 or 220 volts. The equipment includes the compressor, motor, belt, gauge, hose and connections, connector plug and switch, pan, receiver, truck and necessary wrenches and duplicate parts list. The unloader and automatic start and stop controller are listed as extra. The company will forward descriptive matter and price list upon application.

TAPS AND DIES.

The American Tap & Die Company, Greenfield, Mass., is issuing a neat illustrated catalogue, showing various forms and sizes of dies, reamers, screw plates, taps, tap wrenches, etc., which will be forwarded free of charge to the trade.

Ingersoll-Rand Imperial Twelve Portable Electrically Operated Air Compressor.

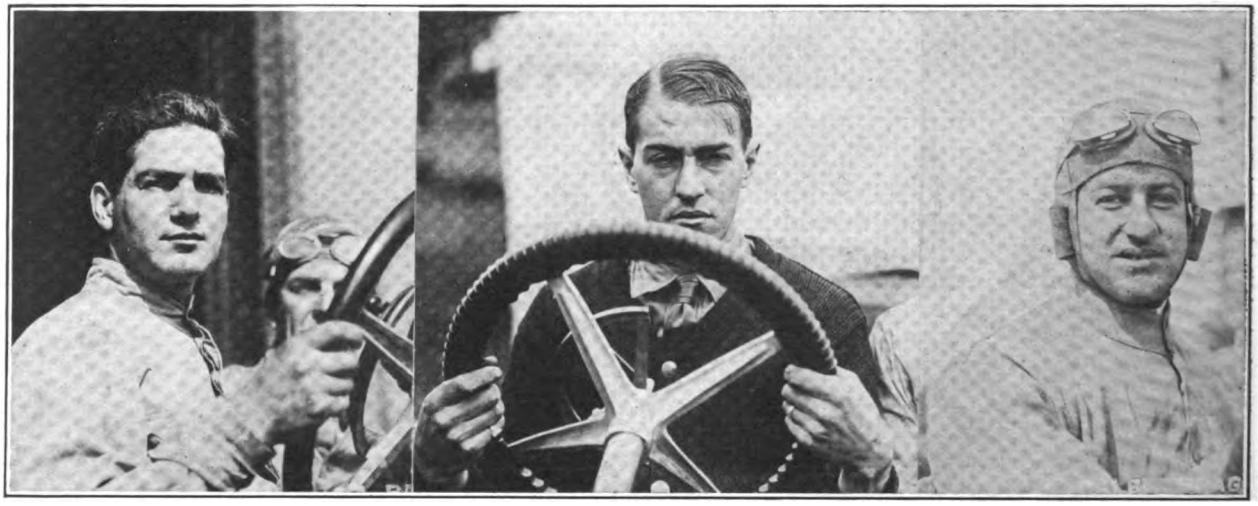
RACING VS. TOURING CONTESTS.



Mercer Official Explains Why Company Prefers Former Test for Its Cars.

Inasmuch as the Mercer Automobile Company, Trenton, N. J., maker of Mercer cars, has been one of the most earnest supporters of properly planned and well conducted races, it has often been asked why it favored this form of contest in preference to touring events. A member of that organization has set forth the reason briefly as follows:

"As a contest the average tour rarely accomplishes any great good. The promoters of these events are well meaning in their efforts, but we believe that by striving to accomplish the impossible—to combine a tour and a contest—they fail in their efforts. For the advancement of the industry, and thereby to assist our manufacturers, what we need are properly conducted long races, where speed with safety will be the only factors. In our opinion the various road races held in this country and in Europe during the past few years have done more to perfect the automobile than all other factors combined. To participate in racing a car must be able to withstand strains that would never be imposed upon it in ordinary touring.

"A conspicuous result of racing during the last two or three years has been the remarkable development of small motors. It has helped in their refinement until today engines of 300 cubic inches piston displacement are able to maintain great speed in races of almost any length. Evidencing this fact was the showing of the 300-inch Mercer in the 500-mile Indianapolis sweepstakes race of May 30, 1912. The Mercer was the smallest car in the race, and yet it finished third, defeating many of the world's most powerful speed creations.

"A touring contest merely shows that good cars can be driven a distance of 150 miles or so a day, at a speed slightly in excess of the legal rate, and under conditions a little more strenuous than those governing ordinary everyday summer tours. We are all fully aware that these same cars do such work every day, and will continue to repeat the performance. We feel that a demonstration of this sort is more or less useless. When the tour is finished it is usually announced that certain cars finished without penalty, and that certain others failed to do so. This is all that is known as a result of the event."

The Mercer Racing Team for 1913: Left to Right, Ralph De Palma, Spencer E. Wishart and Caleb Bragg.

The Mercer team for 1913 will consist of Ralph DePalma, Spencer E. Wishart and Caleb Bragg, and will appear for the first time in the 500-mile race on the Indianapolis speedway, May 30. DePalma and Wishart will soon take up their headquarters at the factory, while Bragg will join them there upon his return from Europe some time this month.

The Perfection Spring Company, Cleveland, O., maker of high grade pleasure car and motor truck springs, is calling attention to its product in a neat wall hanger, reproducing the painting "Indian Maid," by Eugene Carraine of Philadelphia. The subject is treated in a thoroughly pleasing manner and the wall hanger is one which will appear to advantage on the office wall.

OPENS NEW YORK BRANCH.

French Maker of Gaulois Tires to Compete with American Manufacturers.

Formal announcement is made of the opening in New York City of a United States selling branch for the Etablissements Bergougnan of Clermont-Ferrand, France, maker of the well known Gaulois tires, and the first shipment of 5000 casings has been received at the headquarters, 64th street and Broadway. Jean Grenier, representative of the French firm, explains that his house has refrained from marketing its product in this country heretofore because of the duty of 35 per cent., which is held to be sufficient to wipe out all margin of profit. The action is taken at this time in anticipation of a material reduction in duty by the present administration at Washington.

It is stated that Gaulois tires have been in use abroad for 17 years and that their reputation is of the best. The company has exhibited at all international expositions since 1900 and has received highest awards at Paris, Turin, Hanoi, St. Louis, Liege, Milan, London, Saratoga, Quito, Brussels and Buenos Aires. It has refrained from making special racing shoes and this is held to explain the fact that the product may not be as well known on this side as some, but it is added that in last year's reliability trials of the French war department, 11 out of the 12 prize winners were equipped with Gaulois tires.

The Bergougnan works are said to be the second largest in the world. The number of workmen employed is 3500 and the output is in excess of 1000 tires a day. The concern was encouraged to enter into competition with American makers because of the splendid success achieved in Canada, where Gaulois tires are very much in demand, despite the duty of 35 per cent., which also is in effect there. The popularity of this line in Great Britain, South America, South Africa and other sections where all tires are on an equal footing is held to be a strong point in its favor.

One of the Non-Skid Gaulois Tires.

Gaulois tires are in four styles, two smooth and two non-skid treads. The smooth treads come in a perfectly round and a squared surface, while the non-skids are either metal studded or with corrugations made from the word Gaulois in raised letters. Both American and French sizes are furnished by the New York branch.

Factory of the Etablissements Bergougnan at Clermont-Ferrand, France, Where the Gaulois Tires Are Produced.

VALUE OF PROPER FOCAL ADJUSTMENT.

WITH electricity replacing other illuminants to a large extent, the automobilist naturally concludes that the work of cleaning burners and mirrors, replacing gas tanks and fussing with

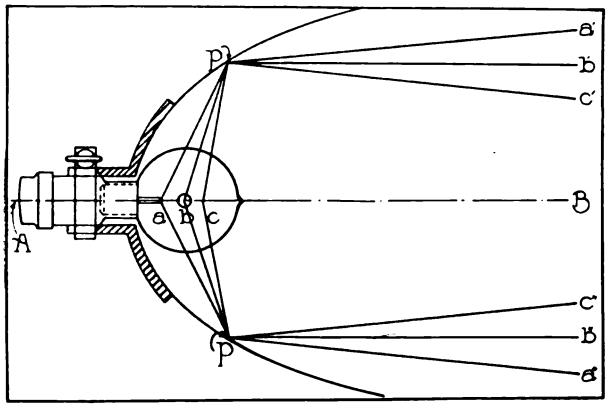

Fig. 1—Depicting Focal Value in Parabolic Automobile Electric Headlight.

leaky tubing and carbide has been eliminated. The pressing of a button or the turning of a switch lever when light is desired, appeals to his sense of convenience. While it is admitted that the newer form of illuminant, insofar as the motor car is concerned, requires less attention than the acetylene system, there are several factors which should be given attention if maximum efficiency is to be secured.

The life of a bulb is limited. By this is meant that its candlepower falls off with its length of life and during its latter half, for example, the loss may be 20 to 30 per cent. or more, depending upon the filament. The watts a candlepower are increased proportionately. Variation in voltage, below or above normal, results in less illumination in the former instance and decreased life in the latter. An example of falling off in candlepower is noted in the ordinary incandescent bulbs having carbon filaments. In time the filament loses its brilliancy, becoming dull.

Another factor to be considered is the breaking of a bulb and its replacement. This brings up the subject of focussing the new lamp, a subject that is attracting considerable attention among electrical engineers, some of whom hold that there is still room for improvement in the design of electric headlights. Going a step further, different dimensions of the filament have an important bearing on the character of the beam and this contention is borne out by a series of experiments conducted by the engineering department of the National Electric Lamp Association, Cleveland, O., the results of which are depicted in an accompanying chart at Fig. 3.

The chart shows the distribution curves of a seven-inch parabolic reflector equipped with different types of electric vehicle lamps. Readings were taken 40 feet from the reflector with a Weber photometer. The apparent candlepower of bulbs of varying filaments will be noted by the curves.

The parabola was first fitted with a 52-volt, 15-watt, 12 candlepower Mazda vehicle lamp, a spider wound G 16.5 bulb, .5 by one inch. The test showed that an apparent candlepower of 750 was derived and that the beam was diverging, being in excess of 20 feet.

The second test was made with a 52-volt, eight candlepower, close coil, carbon G 12 bulb, .1875 by .25 inch. In this instance the apparent candlepower was 2750 and the beam 13 feet.

A 70-volt, 15-watt Mazda, 12 candlepower, concentrated type coil filament, G 12 bulb, .25 by .375 inch, showed an appreciable gain over the other forms, in that over 2800 candlepower was secured and that the beam measured 10 feet.

The final test was with a 24-volt, 15-watt Mazda, concentrated type coil filament, G 12 bulb, .25 by .25 inch which gave an apparent candlepower of 6500 and a beam of approximately nine feet. The concentrated filament type is of recent introduction and the distribution curves show that the dimensions of the filament are im-

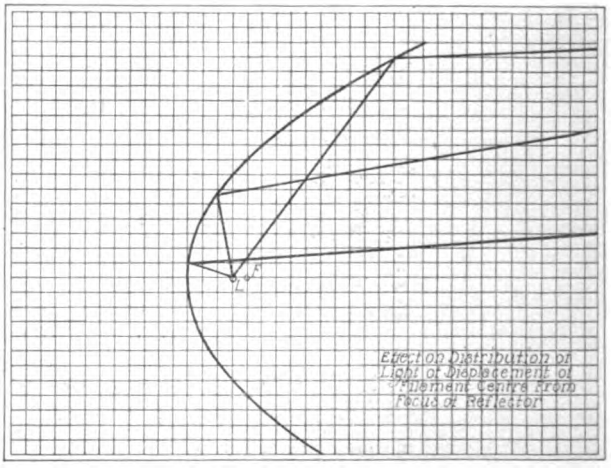

Fig. 2—Showing the Effect of Altering the Distribution of Light from a Headlight.

portant factors in electric lighting systems.

When one attempts to alter the distribution of light from a headlight, fitted with the regular six-volt helical coil filament lamp, upon moving

Digitized by Google

the bulb forward or backward along the axis of the reflector, it is found that there is one position at which the nearest approximation to a needle or parallel sided beam is secured. If the lamp be brought nearer the vertex of the reflector a more divergent beam is obtained, while at the same time the field is rendered less uniform. This is made evident from a study of the diagram presented at Fig. 2, which shows three rays of light traced from the lamp, to and from the reflector. It will be noticed that the rays that strike the reflector near the vertex and also those that strike the reflector near the extreme outer edge, are reflected in a direction more nearly parallel to the axis than the rays reaching the reflector at intermediate positions. It is evident that this will result in rings of relatively high and low illumination in the field lighted.

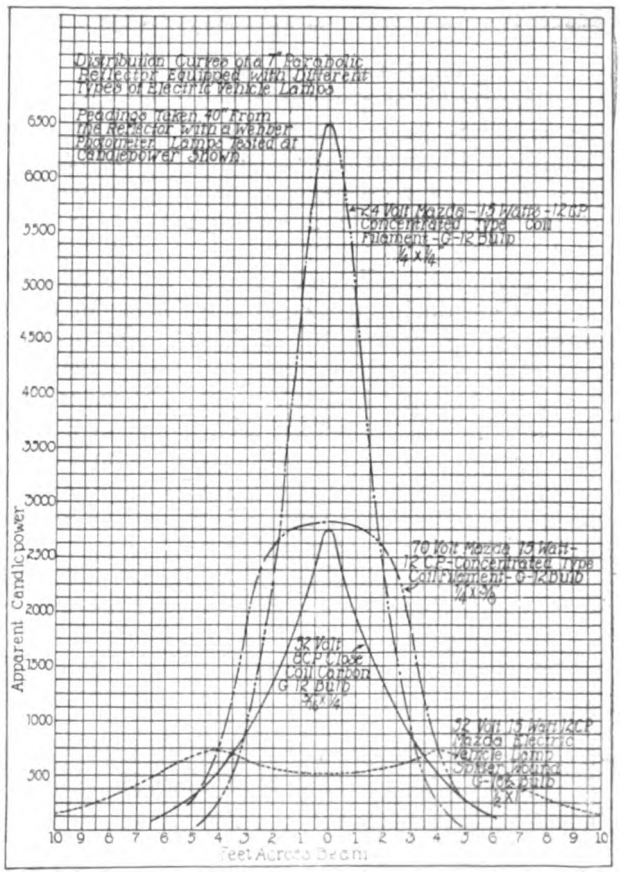
These diverging and parallel beams, as well as the value of focal adjustment, are shown at Fig. 1. For the benefit of those not familiar with the subject it is stated that upon the proper location of the bulb depends the efficiency of the lamp. The drawing depicts a sectional view of the reflector, lamp and socket. There are three cases to be considered, namely: The filament at the successive positions a, b and c, as denoted. Positions a and c are any two locations behind and ahead, respectively, of the geometrical focus of the deflector, and that at b is at the geometrical focus.

Assume that the centre of the filament is at a. A ray of light emanating from this point and incident upon the reflector at any point as at P will be propagated along the line Pa'. It will be noted then that a system of rays taken through a complete revolution about this point will form a truncated cone of rays. A large amount of light will, therefore, be uselessly dissipated in the air.

In the second case to be considered, a ray of light also striking the reflector at P will assume the direction Pb'. Thus a complete series of rays will form a cylinder parallel to the major axis AB. This is held to be an ideal condition for a long concentrated projection.

Thirdly, a ray coming in contact with the reflecting surface at P will in turn follow the direction Pc'. Concentric zones of light and dark on the illuminated plane will be the result.

From the above it will be seen that in the first case the rays are spread out and that distance projection is sacrificed for a wide display of light on the ground close to the machine. In the second instance, a long projection of light; and in the third case an undesirable collection of light and shadow due to the crossing of the rays are the results. It may be added that there is a certain point at the rear of the focus beyond which the rays are spread out, producing an undesirable illumination. This focal tolerance can easily be ascertained by sliding the socket back and forth in its retaining sleeve and noting the illumination produced. This allowable flexibility makes it possible to adjust to suit a difference of opinion as to the proper driving light. It is very evident that appreciation of the influence of the position of the light source is essential in attaining



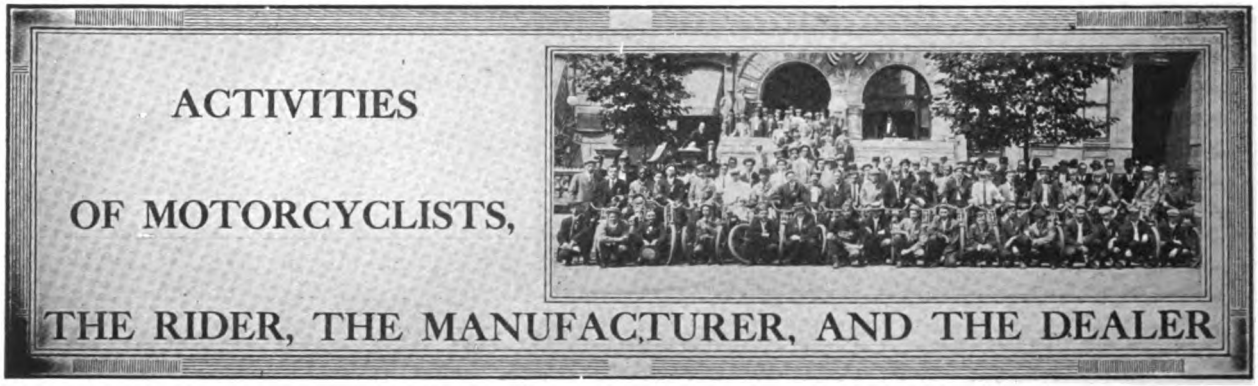


Fig. 3—Chart Depicting Distribution Curves and Effect of Varying the Dimensions of the Lamp Filament—Note the Efficiency of the Concentrated Type Coil Filament.

the best results from the electric headlight, be it a glass or metal reflector.

The Lyons Atlas Company of Indianapolis, Ind., which owns and controls one of the four American Knight engine licenses, has purchased the sample cars, parts, drawings and patterns of the Knight engined cars which were designed by Harry A. Knox of Springfield, Mass. Mr. Knox has located in Indianapolis and will have charge of the automobile work at the Lyons Atlas plant.

Jacob De Rosier Passes On.

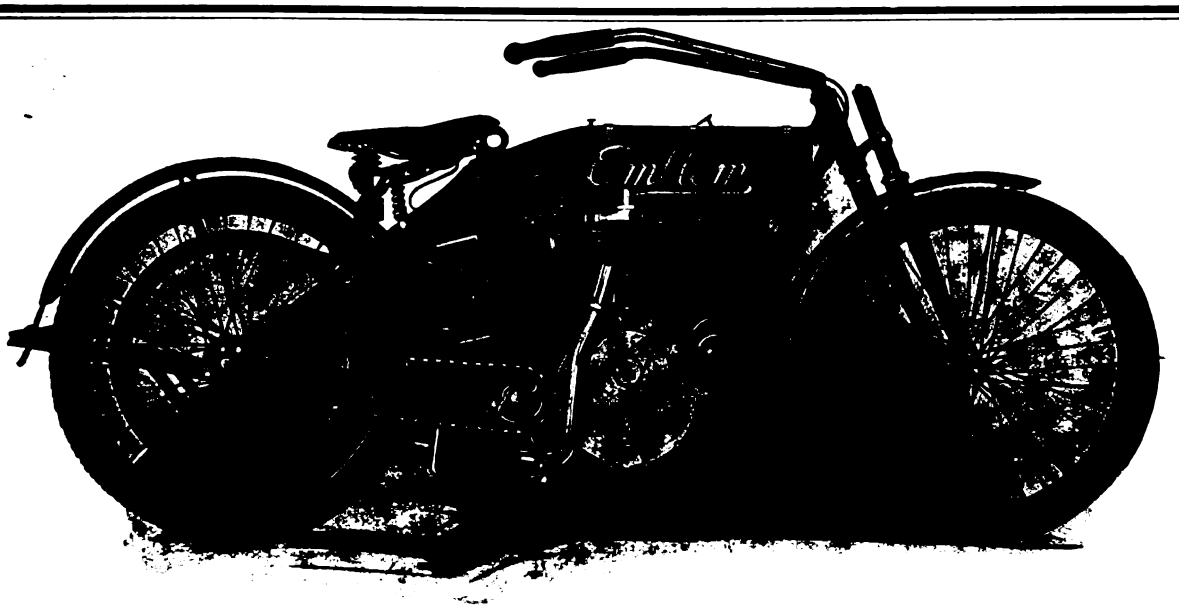
Thousands of persons throughout the country who had known Jacob De Rosier either personally or by reputation as one of the fastest and best motorcycle racers who ever rode a machine, were shocked by the announcement of his death at his home at Springfield, Mass., the night of Feb. 25, as the result of an accident at Los Angeles, Cal., during a race at the Playa del Reyes motordrome, March 10, 1912. Despite his serious injuries De Rosier recovered sufficiently to leave the hospital in Los Angeles last month and accompany his mother to their home in Springfield, where another operation was deemed necessary. His remarkable strength was found to have been so far spent as to make it impossible for him to rally from this added shock.

De Rosier's loss is keenly felt, for he did much to advance the interests of motorcycling and he set an example for honesty and fairness that was exemplary. His fortitude during his year of suffering was remarkable and won for him the admiration of the entire trade. He was born at Quebec, Canada, 33 years ago and took up motorcycle racing at Los Angeles when he was 23. At the time of his injury he was the holder of the records up to 100 miles and his distance for the hour was 83 miles and 135 yards. These marks were set with an Indian machine.

The Late Jacob De Rosier, at Los Angeles, Shortly Before the Accident Which Resulted in His Death at Springfield, Mass.

In July, 1911, he represented the United States in the Tourist Trophy race on the Isle of Man and finished 12th. Following this he raced Charles Collier in a series of contests for the world's title on Brooklands track, England. He won the third and deciding heat of 26 miles, for which he was presented with a purse and banqueted by Collier's father at a brilliant function in London.

De Rosier's death ends a career in motorcycle history that will be difficult to surpass and no testimonial of his popularity is as significant as the sincere regrets expressed at his death by his myriads of friends throughout the country.



Planning Joint Tour.

One of the most interesting motorcycle runs planned for the coming season is that of the Aberdeen Motorcycle Club, Aberdeen, S. D. This organization, together with the Sioux Falls Motorcycle Club, Sioux Falls, S. D., is completing arrangements for a trip to the Black Hills country. The route will include a visit to the home of the famous Deadwood Dick, and a stop at the greatest quartz gold mines in the West. If the July convention of the F. A. M. be held at Denver, Col., the tour will be arranged to include the convention city on the return trip.

Motorcycle Vacation Trip.

Five cadets from the Manlius Schools at Syracuse, N. Y., accompanied by Prof. W. R. Berger, will make a summer motorcycle trip through the British Isles and portions of Continental Europe. They will leave in June and will return in October. After landing at Liverpool they will proceed to Chester, Oxford and London. The party will ride leisurely through Holland, Bel-

EMBLEMISM AND OPTIMISM GO HAND IN HAND

Do you, Mr. Rider, feel the bumps along your way? Emblemize.
Does your engine trouble? Do you something awful say? Emblemize.
Do you, Mr. Dealer, like to see your business pay? Emblemize.
To please the rider helps the dealer. It's the Emblem way. If you're wise, Emblemize.

Write Dept. D for Catalogue and Descriptive Literature. Dealers, Ask for Agency Proposition.

THE EMBLEM MANUFACTURING COMPANY
Also Makers of the Famous Emblem Bicycles.
ANGOLA ERIE COUNTY NEW YORK

gium, Germany, Switzerland and Italy, returning to London for the international motorcycle race, Sept. 22.

Co-Operating with Rural Drivers.

The St. Louis Motorcycle Club, St. Louis, Mo., has passed the following interesting resolutions: "Resolved, That motorcyclists, when approaching teams on rural highways, signal the driver of the team, who shall either pull to the right of the road, signifying motorcyclists to pass, or hold up his hand as a signal for motorcyclists to approach and pass cautiously. Teamsters are requested to give their support to this rule and assist in its application."

This resolution is the result of frequently expressed anger against motorcyclists by rural drivers when perhaps with an adequate system of signalling all misunderstandings can be overcome and better feeling prevail.

In Memory of Col. Pope.

It has been decided by the Hartford Board of Trade, Hartford, Conn., that on Memorial Day, May 30, the drinking fountain which cost over $5000, will be dedicated at Pope park, that city, as a tribute of the work of the late Col. Albert A. Pope for the bicycle industry and good roads. The fountain is said to be a beautiful creation and has been in preparation for some time by experts. The dedication ceremonies will be conducted with fitting tributes to the memory of Col. Pope by many old friends.

Providence Club's Annual Banquet.

The Providence Motorcycle Club, Providence, R. I., recently gave its annual banquet at Verdani hall, Weybosset street. About 50 members and their friends were present and the event was one of the most successful ever conducted by the club. After the banquet President Buffington,

who acted as toastmaster, introduced Dr. G. B. Gibson of Westboro, Mass., secretary-treasurer of the F. A. M., who spoke of the work and re-

New Office Building of the Miami Cycle & Manufacturing Company, Middletown, O.

cent growth of the organization. He also told of the new tourist map service, recently inaugurated.

An interesting programme was rendered under the direction of the entertainment committee and a general good time was enjoyed by those present. Among the other speakers was B. A. Swenson, who gave an account of his trip through New England and the White Mountains. John Kay gave vocal numbers, while piano selections were rendered by E. G. Luther.

New Merkel Buildings.

Accompanying illustrations present two of the new additions to the plant of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel machines. One is that of the new office building, which was taken over last week and which is held to be one of the most modern of its kind.

The structure is four stories high and is of concrete and steel throughout, the front being faced with artistic buffed brick. Just inside the door is located a waiting room for visitors, while on the left is a large telephone switchboard connecting with every department in the factory. President K. R. Jacoby's office is located on the right and just beyond this is the office of Designer J. F. Merkel. The left side of the first floor is occupied by the accounting, purchasing, paymaster and cashier's departments and the office of H. S. Wise, assistant general manager and treasurer. The sales and advertising department occupies the entire second floor, the production department is on the third, and the experimental department on the fourth.

The other illustration is that of the new wing which has just been added to the plant. This also is of concrete and steel construction, and practically all the sidewall is of glass, affording excellent light and ventilation. The entire first floor is given over to the shipping department and an extra long platform makes it possible to load three cars at one time. As the receiving is done from a special track laid at the other end of the factory, there is no congestion between incoming and outgoing freight.

The motor assembling department occupies the entire second floor and the new specially designed assembling stands make it possible to assemble 100 motorcycles a day. The third and top floor is occupied by the bicycle department and some idea of this branch of the business may be gleaned from the fact that between 300 and 350 machines are shipped every working day of the year.

Pope to Add New Building.

Owing to the increase in business, it is said the directors of the Pope Manufacturing Company, Hartford, Conn., maker of Pope motorcycles, are considering building an addition to the company's factory at Westfield, Mass., to increase the facilities of the motorcycle department.

Middletown Club Opens Season.

The first run of the season was given by the Middletown Motorcycle Club, Middletown, O., recently, the destination being Cincinnati, O. All the riders were mounted on Flying Merkels, made by the Miami Cycle & Manufacturing Company, Middletown. From the home city the riders went to Hamilton and thence to Cincinnati, where they were entertained by the members of

Factory Addition Recently Occupied by Flying Merkel Forces at Middletown, O.

the Queen City Motorcycle Club. F. L. Valiant, advertising manager of the Miami company, was host at a chicken dinner at Shuler's, after which

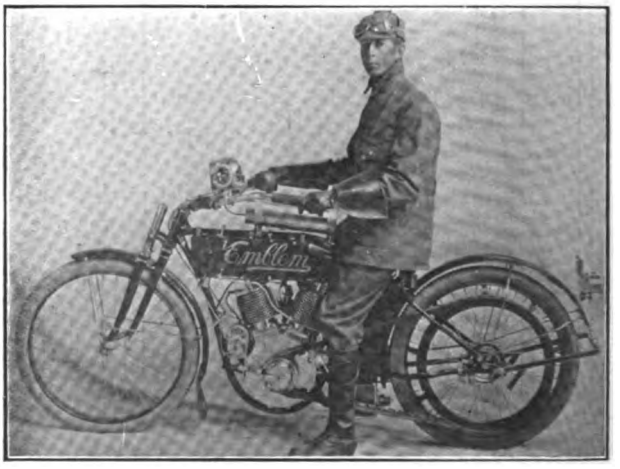
distance of about 110 miles. Among those in the party were the following: L. S. Taylor and L. Huntsberry, the latter of Cleveland; G. R. Mashon, M. E. Jones, Emil Buerger, F. Stenger, H. C. Forster, L. S. Dockstader, F. L. Valiant.

Douglas Visits Indian Chief.

W. W. Douglas of Douglas Bros., one of the most prominent makers of English motorcycles, was a recent visitor at the Indian factory at Springfield, Mass. He stated that his firm built an average of 6000 machines annually, which is much smaller than the number produced at the Hendee factory. He understood how the production could be accomplished on such a large scale in this country, but expressed doubts as to his reputation for veracity when he should give the figures at home.

Additional Merkel Distributors.



The Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, has appointed the following distributors for the coming year: Neihaus & Dohse, Dayton, O.; Sawyer & Son, DeKalb, Ill.; Matthew Lamberg, Bridgeport, Conn.; A. A. Stoddard, Jacksonville, Fla.; A. D. Swanson, Galesburg, Ill.; A. L. Marple, Cumberland, Md.; John G. Ledyard, Camden, N. J.; Cliff Tunti, Lorain, O.; C. E. Grass, Troy, O.; H. A. Jackson, Scottdate, Ia.; Roanoke Cycle Company, Roanoke, Va.; Poultney Auto & Machine Company, Poultney, Vt.; H. W. Vandever & Co., Wilmington, Del.; H. S. Brant, Norristown, Penn.; George B. Carter, Petersburg, Va.; Bond Bros., Muscatine, Ia.; C. A. Van Doren, Atlantic City, N. J.; Ropson & Brown, Batavia, N. Y.; Theodore Henn, Eldora, Ia.; Connor & McCargel, Hagerstown, Md.; C. H. Merrill, Winchendon, Mass.; A. L. Aumack, Vineland, N. J.; S. Savaraske, Brooklyn, N. Y.; Cooper & Co., Ashland, O.; J. E. Swank, Bucyrus, O.; Milton & Mathews, Mt. Gilead, O.; D. M. Hottenstein, Lebanon, Penn.; Beloit Motor Garage, Beloit, Wis.; George Dern & Co., Wausau, Wis.

Yale Proves Economical.

News from Washington, D. C., indicates that the government may investigate the feasibility of using motorcycles in the new parcel post service. A. H. Pendl of Chicago, one of the government special delivery messengers, has interesting data on the subject, collected during his regular work, that are decidedly pertinent. He purchased a Yale motorcycle in February, 1912, since which time he has covered more than 12,000 miles in and around Chicago. Mr. Pendl states that his maintenance expense has been less a mile than he formerly expended on his bicycle. His total mechanical expense for the 12,000 miles was $9.50, divided as follows: Batteries, $3; tire repairs, $2; pulley lagging, $1; ignition points, $3.50.

The Sturdy Emblem.

The reputation for sturdiness which has been gained by the Emblem line, made by the Emblem Manufacturing Company, Angola, N. Y., has not suffered in the least since the announcement of the big 10 horsepower twin just previous to the New York show. Those who have seen the new mount are particularly pleased with its general appearance, while it is instantly recognized as a fitting companion for the other Emblem models.

R. P. Colwell, Manawa, Wis., and His Emblem Mount.

The line is expected to make an appeal to the discriminating rider, who desires a machine that will stand up under all conditions to be met on

Digitized by Google

long journeys. It is maintained by the company that each of the three models presents everything that a rider could possibly demand, according to the horsepower. There seems to be little doubt that the Emblem for 1913 will maintain the reputation for sturdiness which has served thousands of riders in the past.

More Than 20,000 Members.

During the month of February the membership of the Federation of American Motorcyclists passed the 20,000 mark, the number now being 20,134. During the month a total of 355 new members were enrolled from the various states, as follows: California, 44; New York, 39; Ohio, 36; Illinois, 29; New Jersey, 28; Pennsylvania, 23; Michigan, 21; Oregon, 17; Kansas, 14; Texas, 13; Maryland, 12; Missouri, 12; Massachusetts, 10; Montana, 10; Philippine Islands, eight; Indiana, seven; Wisconsin, six; Virginia, four; Minnesota, four; Iowa, three; Kentucky, three; Maine, New Hampshire, Connecticut, West Virginia, Delaware, District of Columbia, North Carolina, Oklahoma, Utah, Colorado, Idaho and Washington, one each.

Latest F. A. M. News.

The following new repair shops have been registered with the F. A. M.: Mt. Pleasant Motorcycle & Bicycle Company, 3207 14th street, N. W., Washington, D. C.; Garfield Park Auto Garage, 606 Independence boulevard, Chicago; Boller Brothers, 4444 Hudson County boulevard, Union Hill, N. J.; Steen's Hardwood Company, Findlay, O.; Sanford Clark, 2922 Columbus avenue, Anderson, Ind.; Corvallis Bike Works, Corvallis, Ore.

President Patterson has appointed John L. Donovan of 157 North Michigan avenue, Chicago, as state commissioner for Illinois. Ira C. Coombs, 154 West street, Worcester, Mass., has been appointed local commissioner by the Massachusetts state commissioner.

Secretary Gibson announces the receipt of an application for membership from China, the first ever to have been recorded from that country.

Postal cards for return have been sent out to secure the names of the officials and other up-to-date facts relative to the 350 or more motorcycle clubs affiliated with the federation.

New Department Heads.

Among the additions to the Flying Merkel organization within the past month is that of H. Cameron Forster, who has had wide experience in the selling end of other lines. He will take charge of the sales department. A. C. Bryan becomes factory manager and has entire charge of the plant and its production. Louis Weinman is in charge of the order department and will have a number of assistants. C. L. Hartsell is at the head of the pricing department, which is an innovation with this company. C. L. Miller, formerly with the Stoddard-Dayton factory, takes charge of the sales statistics.

H. Cameron Forster of the Flying Merkel Sales Department.

E. W. Adams, who looks after the sales on the Pacific Coast, has been in conference with Sales Manager J. W. Ash concerning the plans for 1914. A night shift was put at work last week and the Merkel plant is now one of the busiest in the country. The present demand for the product is such that the company plans to double its capacity.

Will Hold 24-Hour Run.

The Cleveland Motorcycle Club, Cleveland, O., will hold a 24-hour run to Indianapolis, Ind., May 29-30, to witness the 500-mile automobile race at the speedway on Memorial Day.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

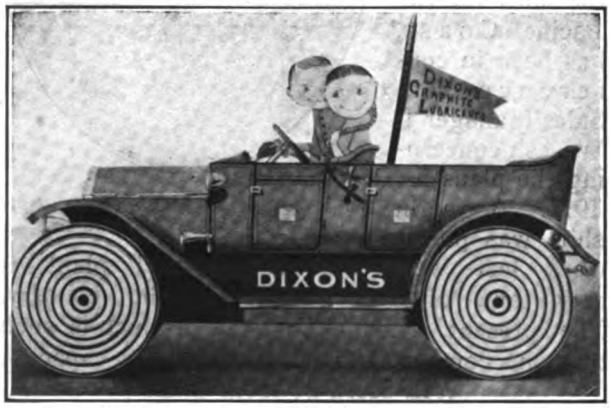
The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Hoyt Garage, Inc., Brooklyn, N. Y.; $1000; Louis C. Brooks, Walter J. Kelly, Charles Blaken.

Maxim Tricar Manufacturing Corporation of Manhattan, New York City; $100,000; Otto Kuneman, Charles F. Novothy, A. A. Meschutt.

Williamson Garage Company, Williamson, N. Y.; $20,000; Alfred F. Raynor and others.

United Garage Company, New York City; $14,000; Samuel Ecker and others.



Welch & Suthergreen Company, Fitchburg, Mass.; $30,000; to deal in motor cars; H. C. Mayo, E. J. Welch, F. E. Suthergreen.

Suffolk Street Garage, Inc., Lynn, Mass.; $5000; Daniel Lynch, John Buckley, Henry Thomas.

Donovan Motor Car Company, Boston; $50,000; Joseph S. Donovan, A. D. Adams, G. E. Donovan.

J. D. Maxwell Motor Corporation, Tarrytown, N. Y.; $10,000; motor vehicles; Jonathan D. Maxwell, James P. McManus, Leander F. Sniffen.

Auto Buyers' Company of America, Inc., New York City; $1000; to deal in motor cars; Julius Lichenstein, John P. McClellan, Arthur A. Hill.

Joseph Dixon Crucible Company's Show Souvenir—Move in a Small Circle and Watch the Wheels Go Around.

E. P. Miller Motors Corporation, Utica, N. Y.; $5000; to deal in motor cars; Harry R. Beebe, William T. Cantwell, Francis P. Miller.

Gas Saver Sales Company, New York City; $25,000; to manufacture motor car devices; H. Clarence Fisher, John H. Miller, Eugene Cable.

Miller Tire Sales Company, New York City; $5000; automobile tires; Harry C. Miller, Harrison C. Mills, Warren A. Schenck.

Co-Operative Used Car Company, New York City; $3000; to deal in automobiles; Joseph B. Bauer, Louis Ezechiel, John Custis.

S. J. Wise & Co., Inc., New York City; $20,000; motor vehicles; C. E. Van Vleck, E. M. Dalley, C. M. Kohn.

Bell & Waring Steam Vehicle Company, New York City; automobiles; Harry G. Waring, Harvey W. Bell, Howard C. Phillips.

Glide Sales Company, Inc., Buffalo, N. Y.; $10,000; to deal in automobiles; J. Francis Lynch, Louis P. Fuhrmann, Edward T. Danahey.

National Welding Company, Jersey City, N. J.; $25,000; general automobile business and to weld, braze, repair and work with acetylene and oxygen; E. P. Hoty, S. H. Culver, J. W. Phillips.

Durable Tread & Automobile Sales Company, New York City; $10,000; to deal in tires, tire treads and other accessories; Rose H. Pacobi, Samuel M. Winkler, Henry A. Deimel.

Buffalo Automobile Sales Corporation, Buffalo, N. Y.; $15,000; to manufacture, sell and make motors, machinery, etc.; William J. Harris, William U. Heverley, Maul McDonald.

Mol Stringer's Garage Corporation, Brooklyn, N. Y.; $10,000; to deal in automobiles and conduct garage; Mol Stringer, James Culleeny, Frederick Huntington.

Maxton Auto Company, Maxton, N. C.; $50,000; to deal in and make automobiles; A. J. McKinnon, R. M. Williams, Byron McCallum, Ernest Williams.

Pratt-Hendricks Company, Brooklyn, N. Y.; $1000; to deal in automobiles; William H. Pratt, William J. Hendricks, George L. Robinson.

WITH THE MANUFACTURER.

The Swinehart Tire & Rubber Company, Akron, O., maker of Swinehart tires, announces it has begun the erection of new buildings and the installation of new machinery to provide for a greatly increased output this year.

The Electric Auto Lite Company, Toledo, O., is building an addition to its plant at 133 Michigan street. The concern manufactures a new combined electric lighting and starting system for motor cars.

The Keystone Spring Works, 1313 Buttonwood street, Philadelphia, Penn., maker of motor truck springs, has enlarged its building because of the increase of business which necessitated more space.

The Kernodle-McDaniel Company, Frantfort, Ind., maker of the Easy Starter and speeder, has sold its rights to that invention to the Logan Auto Supply Company, Logansport, Ind. The former company will devote its entire time to the manufacture of a small device that it is claimed will save the automobile owner money on the consumption of gasoline.

The Findeisen & Kropf Company, maker of the Rayfield carburetor, has established its own sales and service branch at New York City, in the location formerly occupied by the Warner Instrument Company, at 1902 Broadway.

The Auto Products Company of America, St. Louis, Mo., has been incorporated with a fully paid capital of $25,000 with offices at St. Louis, to manufacture Punch's original Nu-Tire and other automobile specialties, such as cement, body paints, polishes, etc. The following are the officers of the company: President, J. C. Punch; vice president, S. C. Punch; treasurer, William Grafeman; secretary, D. T. Punch.

The Auto Tire Filling Company, 1422 Fairmount avenue, Philadelphia, Penn., has leased the entire building at 1722 Fairmount avenue, to be used in addition to the old establishment.

The Bosch Magneto Company, New York City, has appointed the Powell Supply Company, 2119 Farnam street, Omaha, Neb., and the Kansas City Automobile Supply

Digitized by Google

Company, 1504 Grand avenue, Kansas City, Mo., distributors of the Bosch products in their respective territories.

C. W. Whitson has joined the sales force of the Keeton Motor Company, Detroit, maker of Keeton cars, and will travel in the East, establishing agencies at Pittsburg, Penn., Baltimore, Md., Washington, D. C., and other cities outside of New England.

The Joseph Dixon Crucible Company, Jersey City, N. J., through its Boston branch, has prepared an interesting souvenir for distribution at the Boston show. It is termed a moving picture and is presented in an accompanying illustration. It is expected to prove a unique method of calling attention to the graphite lubricating products made by this concern.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has appointed the following distributors: R. L. Adams, McColl, S. C.; Blue Ribbon Garage, Quitman, Ga.; Myrl L. Currier, Enfield Center, N. H.; C. C. Dunn, Barnesville, Minn.; Minnesota Motor Car Company, 111 South 10th street, Minneapolis, Minn.; C. E. Betts, Westport, Conn.; Frank Le Flem, 612-614 Broad street, Philadelphia, Penn.; Central Motor Car Company, 1270 Bedford avenue, Brooklyn, N. Y.; Ayr Auto Company, Ayr, N. D.; George J. White, Irene, Tex.; Anger & Knox, 205 Sebastian street, Napa, Cal.; W. E. Hall Motor Car Company, 25th and Broadway, Oakland, Cal.; C. W. Shimel, Casey, Ill.; Guarantee Motors Company, 707-711 Locust street, Des Moines, Ia.; P. V. Denster, 138 Read street, Milwaukee, Wis.; H. J. Cuyle & Son, Hazelton, Penn.; R. D. Bell, Bellwood, Penn.; George Pugh, 236 North Broad street, Tomoqua, Penn.

The Cole Motor Car Company, Indianapolis, Ind., has appointed the following agents to handle Cole cars: Grigsby & Co., Bardstown, Ky.; J. L. Hay, Camilla, Ga.; Hirsch Bros., Chattanooga, Tenn.; P. Watt Richardson, Greensboro, N. C.; Marx & Marx Auto Company, Le Mars, Ia.; Inman & Presse, Lena, Ill.; Koch & Tisch, Tremont, Ill.; F. B. Porter, Silver Creek, N. Y.

The Dyneto Electric Company, Elbridge, N. Y., maker of starting and lighting devices, has increased its capital stock to $200,000. It is said the company intends to establish a factory at Syracuse, N. Y., and another at Detroit.

The Niagara Gasoline Motor Company, Dunkirk, N. Y., which is planning to organize with a capital of $50,000, has a new motor plant now in course of completion in that city.

The Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly-Springfield trucks, has opened factory branches at 1829 East 13th street, Cleveland, O., and at 4518 Baltimore avenue, Philadelphia, Penn. D. C. Hathaway, formerly general manager of the Dayton Auto Truck Company, Dayton, O., maker of Dayton trucks, has been appointed manager of the former, and James Joyce, formerly general manager of the Selden Motor Vehicle Company, Rochester, N. Y., maker of Selden trucks, of the latter. W. C. Prickett, formerly district manager in northern Ohio for the Randolph Motor Truck Company, Flint, Mich., maker of Randolph trucks, has been appointed salesman at the Cleveland branch.

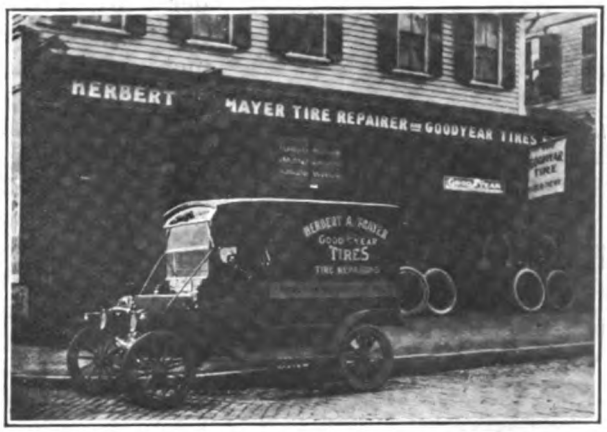
The Keeton Motor Company, Detroit, maker of Keeton machines, has appointed H. D. W. Mackaye special factory representative and he is placing Keeton agencies throughout New York State. Since the formation of the Keeton company Mr. Mackaye has been assistant to President Forrest M. Keeton. He started in the automobile business as assistant to the general manager of the Mora Manufacturing Company, Newark, N. J., maker of Mora power wagons; was with the Jenkins Manufacturing Company, Rochester, N. Y., and previous to joining the Keeton company was assistant sales manager of the Metzger Motor Car Company, Detroit, maker of Metzger cars.

The Michigan Automobile Company, Ltd., which recently changed its name to Fuller & Sons Manufacturing Company, Kalamazoo, Mich., maker of automobile specialties, has decided in future to market its products under the name of Fuller, to avoid confusion with the automobile company of similar name in the same city.

William R. McCulla has taken a position with the Packard Motor Car Company, Detroit, maker of Packard cars, as assistant research engineer. Mr. McCulla has had a long experience in the automobile business and has been connected abroad with such well known makes as the Mercedes, Renault, English Napier and Rolls Royce.

GARAGE AND DEALER.

The Providence Auto Equipment Company, 11 Dorrance street, Providence, R. I., has taken the R. I. V. ball bearings for the State of Rhode Island, and as it is carrying a large stock, will be able to fill all orders promptly.



The Auburn Garage & Auto Company, Fort Wayne, Ind., is the name of a new company recently formed to take over the Auburn garage on West Washington street. Lewis Watson is manager of the concern.

The Crescent Garage Company, Ogdensburg, N. Y., has been purchased by H. G. Chandler of that city and W. D. Evans of Hammond, N. Y. The equipment, automobiles and business of the company was sold to J. O. Speer, who will operate the garage, renting the property of Chandler & Evans.

The Austin Tire & Supply Company, Austin, Tex., has opened a store for tires and automobiles, having secured the agency for American and Regal cars and Goodyear tires. The company is capitalized at $2000.

Gordon W. Turner, the pioneer Ford man of Boston, has purchased the business of the Equitable Distributing Company at 245 Columbus avenue, Boston, and will sell new and second hand Ford cars, supplies, etc. Mr. Turner will continue to occupy his old place of business at 45 Stanhope street.

Herbert A. Thayer, 400-404 Weybosset street, Providence, R. I., not only is the local agent for Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O., but maintains a general business in repairing

Herbert A. Thayer's Goodyear Tire Agency in Providence, R. I., and Ford Car Used in His Delivery Service.

and vulcanizing casings and tubes. That Mr. Thayer is an enterprising business man is borne out by the fact that he has inaugurated a system of calling for and delivering work, in connection with which he makes use of the Ford car shown in the accompanying illustration.

The Chanslor & Lyon Motor Supply Company, Los Angeles, Cal., has established its business at 945 South Main street, that city.

The E. V. Stratton Company, Albany, N. Y., has secured William D. Paine, for some time with the United States Motor Company of Philadelphia, as representative of the Troy district for Hudson cars and Stewart trucks.

Lew Fales, Washington and Dean streets, Providence, R. I., through the manager, Russell C. Fales, has made a special price for painting Ford cars, which is given for cash payments.

O. R. Baum has purchased a half interest in the Chalmers Auto Sales Company, El Paso, Tex., and will conduct it with M. K. Burkhead. The company has purchased the automobile business of Joy P. Knox at 315 Texas street and a large garage will be erected on Santa Fe street.

The Craig-Centre Auto Company, Pittsburg, Penn., has secured additional property on Craig street and will erect new buildings in the near future.

J. S. Brown, Redlands, Cal., has begun the erection of a new garage and machine shop at 346 Orange street, to be known as the Continental garage. Several popular makes of cars will be handled.

AGGRESSIVE SALES CAMPAIGN.

Invader Oil Company Adopts New Plan for Distribution of Its Product.

The acquisition by the Invader Oil Company of the business of Charles F. Kellom & Co., Philadelphia, Penn., has been followed by the establishment of a policy for the distribution of Invader oils that will, with the aggressive selling campaign already planned, largely increase the business and insure representation in practically all sections of the country. Charles F. Kellom & Co., was one of the pioneer firms in the production of automobile oils, and Mr. Kellom is maintained to be the first to advocate and exploit the use of light qualities for gas engine use. The firm was established in 1881 and under Mr. Kellom's management developed business that was substantial and enduring. The only branch it maintained was, however, in Boston, where it was originally in the Motor Mart and later was located at 284 Columbus avenue. Elsewhere Invader products were sold by agents.

E. A. Scheu, Manager, Boston Branch, Invader Oil Company.

The head of the Invader Oil Company is Mr. Kellom, but the executive of the concern is T. E. Tomlinson, who is regarded as an expert in automobile lubricants and their sale. He organized the Havoline Oil Company and successfully directed its activities, and later on left that concern and established the Wolverine Lubricants Company. Mr. Tomlinson is noted for the aggressiveness and success of his selling methods and as vice president of the Invader Oil Company he will direct the selling organization. H. Dunthorn is the secretary and treasurer. The company is organized under the laws of New Jersey with capital of $250,000. The general offices of the company have been located at 80 Broad street, New York City, and the former office at 113 Arch street, Philadelphia, where one of the two factories is located, and the Boston branch have been continued as branches, and besides another has been opened at 3556 11th street, N. W., Washington, D. C. A branch at Chicago is to be opened shortly. The selling organization includes men who have been associated with Mr. Tomlinson in his previous business successes, and among them are A. A. Francesconi, Howard Plowman, Harvey Wilkins, E. Kalkhof, F. Menke and A. Radelson.

The Boston branch will remain in charge of E. A. Scheu, who first was agent for Invader oils in that city, and five years ago established the branch, extending its business throughout New England. Mr. Scheu was from 1903 until he became agent for the oil, connected with the Packard Motor Car Company and the Boston Packard agency, and has had long and practical experience with automobile lubricants. He has developed the business and his knowledge of the New England trade is very large. He has perfected plans for the better distribution of Invader oils and a warehouse is to be established in Boston from which shipment will be made to the customers, affording them a quicker and more satisfactory service than ever before, and plans are making for the promotion of the sale and use of greases and gear oil. Mr. Scheu, who is now a stockholder in the company, is to give his personal attention to the trade and is to travel New England by car the present season and will be in close touch with the representatives of his company. As the business requirements demand the selling force will be increased and nothing will be neglected that will in any way contribute to the promotion of the sale of Invader oils.

THE EXHIBIT IN CONCORD.

New Hampshire Motorists Take Advantage of Opportunity to Inspect New Models.

The annual show of the Concord Auto Association in the Auditorium, Concord, N. H., was held during the week of Feb. 18-25. Full advantage was taken of the opportunity to inspect the season's offerings, some 30 different cars being arranged amid simple and effective decorations. A number of sales was recorded and several satisfactory prospects are being followed up by the local dealers. Those who made display were:

Concord Auto Sales Company, Cole; Fred L. Johnson, Buick, Cadillac; Norris A. Dunklee, Hudson; George T. Hillman, Oakland; George C. Chase, Metz; J. W. Hazeltine, Reo, L. Dale Brown, Rambler; John Martin, Haynes; I. E. Gray, Overland, Davis, American; Thompson & Hoague, supplies; Harriott & Co., accessories.

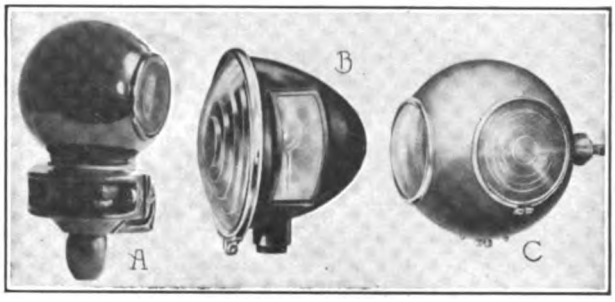
LIGHTING THE CAR BY A BATTERY SYSTEM.

IF IT were possible to present statistics showing the number of cars the owners of which have converted the gas and oil lamps into electrical units, the figures, no doubt, would surprise even the most observing. Indicative of this following of general practise to employ electricity as an illuminant is the utilization of the current of the magneto by owners of model T Ford automobiles. And a large number of other motorists have installed electric side and tail lamps, utilizing an ample sized storage battery as a source of current. While lighting the motor car by the straight storage battery system was fully discussed in The Automobile Journal some time ago, information upon the subject is presented herein in response to numerous inquiries as to the practicability and the method of proper installation.



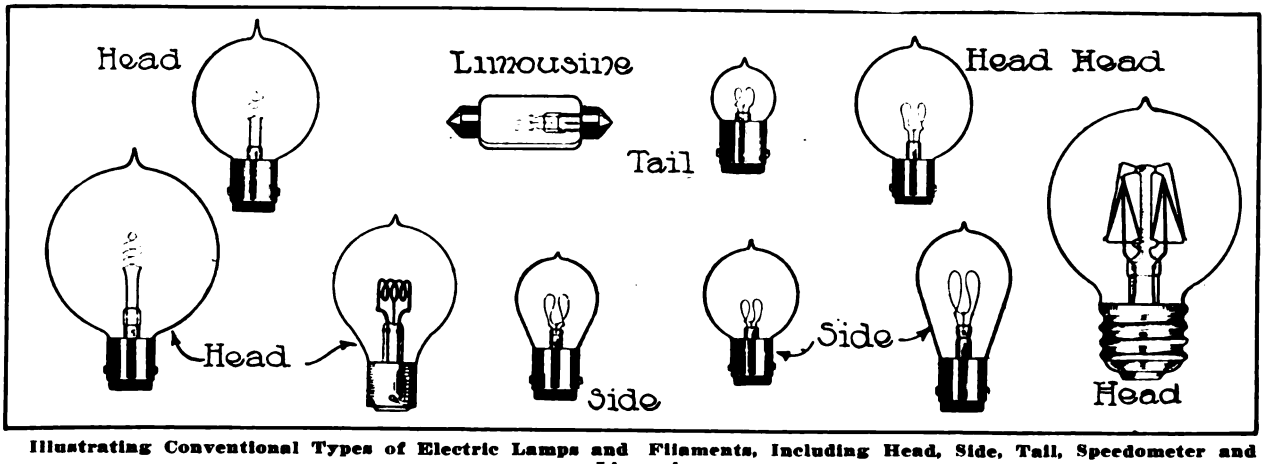
Advantages and Disadvantages.

While some engineers do not advocate the use of electric lighting on the automobile without means for recharging the cells, by a generator for example, it is noticeable that several 1913 models are equipped with the straight storage battery system. It is admitted that the dynamo system is far superior in every respect, but it must be taken into consideration that there are thousands of automobilists who desire electric lighting, but wish to curtail expense.

The disadvantages of the straight storage battery system are that the amount of service is dependent upon the size of the battery, and condition of the cells, and that the latter must be recharged, during which time another battery must be substituted. As the efficiency of the lamps is impaired when the voltage drops below a certain point, it is obvious that the system will require considerable attention from the motorist.

Battery Capacities.

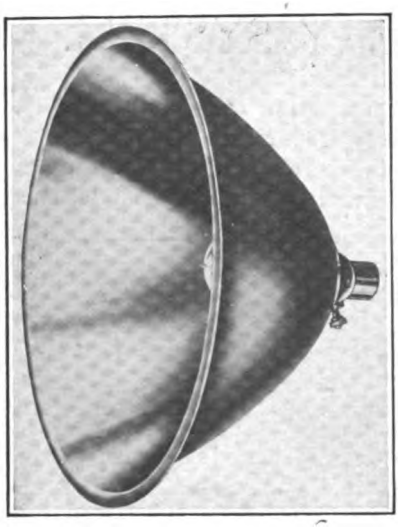
Some motorists make the error of installing a battery having too small an output; that is, the



Showing Different Types of Tail Lamps: A, Esterline All Glass; B, Gray & Davis; C, Holt & Beebee.

ampere-hour capacity is limited. It is the opinion of the writer that nothing less than a 100 or 120 ampere-hour member should be employed and especially if the system is to include headlights. Regarding the use of the latter, it is optional with the owner, but it should be borne in mind that with all five lamps burning there is considerable drain upon the cells and the number of hours of service will be greatly reduced thereby. This is made clear in an accompanying table which presents statistics showing the current required to operate various groups of lights.

And it will be seen that it would require but a comparatively short time to drain the battery when employing headlights, although the side members would naturally be cut out when the large lamps were utilized.



Selecting the Bulbs.

As the side and tail lights are not depended upon other than to meet the requirements of the

Illustrating Conventional Types of Electric Lamps and Filaments, Including Head, Side, Tail, Speedometer and Limousine.

Digitized by Google

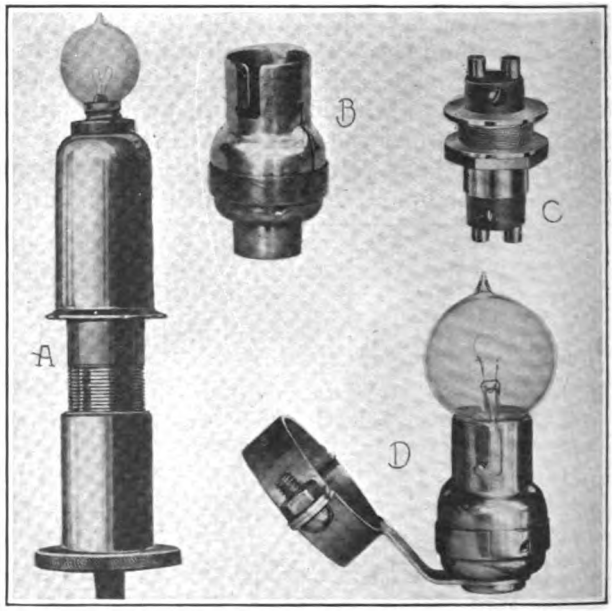
Apico Reflector for Gas Headlights.

law, it is possible to employ bulbs of low candlepower. By utilizing six-volt Mazda lamps of 1.5 candlepower for the side and rear lights considerable more service will be secured from the battery. These lamps consume .3 ampere respectively and it is obvious that many more burning hours will be derived by their use. If the system is to include headlights, two 15 candlepower bulbs, for example, these would consume five amperes and the hours of service would be approximately 24, with a 120 ampere-hour battery. If utilized with side and rear members, the service would be less. The problem of lamps is one that may be solved easily by the motorist, depending as it does to a great extent upon service desired.

Installation of Battery.

Too much stress cannot be laid upon the importance of proper installation of the battery. Irrespective of whether it be located on the running board or suspended beneath the car, means should be included for clamping it firmly. While batteries are constructed to withstand severe service they must not be allowed to slide or jounce in the container. The bottom of the box should be of wood, with grooves having holes to permit of draining any electrolyte that may be spilled. The wood should be treated with a coat of paraffine (boiling the wood in it being preferred), or some acid resisting material. Suitable ventilation should be provided as in the discharge the temperature rises. While the air should be allowed to reach the battery, foreign elements must be excluded for the reasons defined in an article upon care of batteries appearing elsewhere in this issue.

Keep the terminals bright and clean. Never allow deposits to accumulate. Connections to the positive and negative poles should be of sufficient size and the cables equipped with solid terminals. The three-cell lead type of six-volt battery should not be allowed to fall below 5.4 volts nor permitted to stand in a discharged condition for any length of time.



In converting the gas headlights into electrical units care should be exercised to select parabolic reflectors that are well designed for upon the parabola depends the efficiency of the light. There are many designs from which to make choice, but it should be borne in mind that the cheapest are not the most economical in the end.

Current Consumption by Various Lamps.

Lamps	Candlepower, A Lamp	Candlepower, Total	Total Watts	Amperes at 6 volts	Hours, 120 Ampere-Hour Battery

*Burning half the time. †Burning all the time.

The oil side lamps may be converted into electrical units very easily and a number of ingenious devices are marketed for this purpose. Some are of the adapter type as shown in an accompanying illustration, to install which a hole is cut in the metal part of the lamp and the parts assembled. Other designs permit of attaching the socket over the oil burner, a construction that requires

Tarvia

Preserves Roads
Prevents Dust~

Broadway, Norwich, Conn., Treated with "Tarvia B."

A Dustless Thoroughfare

"TARVIA B" is a tar product which is liquid at normal temperatures and can be applied to the surface of a macadam road from a modified sprinkling cart, no other apparatus being necessary.

The usual procedure is to sweep the road of surface dust and dirt, apply the Tarvia B and keep the traffic away for a few hours until the Tarvia has penetrated into the road surface. This grade of Tarvia is used only on roads where the rolling effect of traffic has made the interstices between the stone very small; on this account a denser grade of bitumen would not do, because it could not percolate into so closely bonded a surface. Tarvia B, however, finds its way into such surfaces and forms a matrix, holding the fine screenings in position, preventing raveling and erosion, preventing the formation of dust by automobile traffic and greatly prolonging the life of the roadway.

A typical instance of the use of Tarvia B is in Norwich, Conn., Mr. E. C. Lillibridge, the Street Commissioner there, wrote as follows:

November 15, 1912

"You ask for my opinion concerning Tarvia B to which I will say I do not believe it has any equal. We have used this material for three years and the more it is used, the better satisfaction it gives, as to preserving the road and lasting longer. We have the last year used this material on two miles of streets and today those streets are in excellent condition after the traffic of heavy teams and autos."

In addition to Tarvia B there is Tarvia A for hot surface application and Tarvia X for road construction.

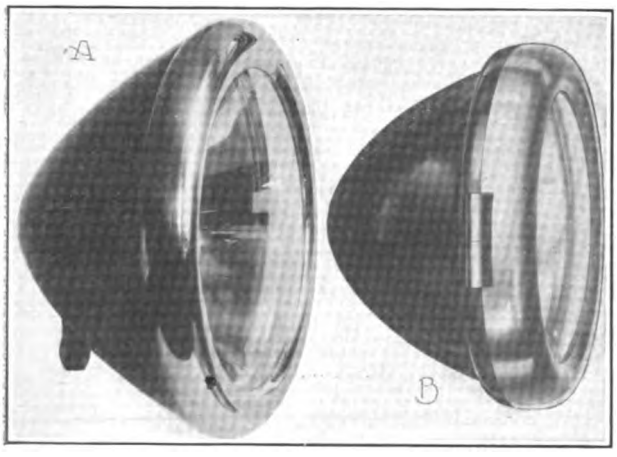
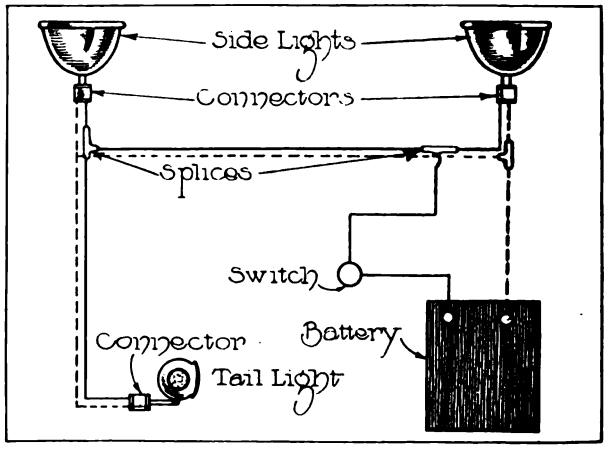
General Electric Two-Gang Flush Tumbler Switch: At Left, Busbar and Terminals; at Right, the Tumblers.



no other work than the use of a screw driver. There are a number of attachments for kerosene lamps which may be fitted without disturbing the oil fount or burner. The equipment may include means for attaching the trouble lamp, the cord carrying a plug device which makes it a simple matter to make connections on the dash.

Switches.

The type of switch will depend upon the number of lamps. If the group includes five it should be of the selective design, which permits of the use of the head, side or tail as desired. If the system comprises but the side and tail members, a single-throw switch may be fitted. A two-gang tumbler flush type switch is depicted in an accompanying illustration and is provided with a busbar and sturdy connections.



Wires.

The efficiency of the lighting system depends largely upon the wires utilized. Single or double and even triple-strand cables are marketed, but irrespective of the type employed it should be well insulated to withstand abrasion due to wear. Manufacturers of lighting cable have given special attention to the problem of wires and among the makers of standard cable are the Packard Electric Company, Warren, O., and the General Electric Company, Schenectady, N. Y. The latter company produces an armored cable having half-round brass wire armor for protection. With any type of wire it is imperative that it be moisture, heat and oil proof. Too much care cannot be exercised in securing the cable and all connections should be well soldered. Where any metal part is exposed, it may be guarded against possible short circuits by tape. Relative to the sizes of wire, Nos. 10, 12 and 14 are most commonly used.

Conventional Types of Electric Lamps: A, Esterline Golden Glow Headlight; B, Gray & Davis Side Lamp.

The wire between the battery and the switch should not be less than No. 10, while that between the switch and lamps may be No. 14. It

Showing Wiring Plan for Side and Tail Lamps with Straight Storage Battery System.

is recommended to employ No. 14 twin-conductor cable throughout, using the twin conductors of each cable in multiple for the battery leads and using one twin-conductor cable from each lamp to the switch. This makes for simple wiring and avoids cross splices. All connections are made at the binding posts of the switch and battery, and at the cable couplings of each lamp. With an arrangement of five lamps the switch must be adapted for at least three separate circuits, although provision may be made for additional lights if desired. Tampering with the lights may be prevented by locating an extra switch in an inconspicuous place to be employed to cut out the battery.

Complete data upon lamps, adapters, connectors, reflectors, batteries, etc., are supplied by the makers of these members free upon request. No reference has been made to the cost of installation of the straight storage battery system as individual requirements vary. The subject of charging the battery as well as current measuring

O-TAK-A TIRE REMOVER.

Twenty-Five Thousand (25,000) Sold Last Season. Not a Single Complaint---Every Tool Guaranteed. Money Refunded If Not As Advertised.

O-TAK-A Tire Remover is the only tool on the market that will release the lock ring by a plunger that forces back the floating ring without any injury by hammering or pounding the rings, causing bead blow-outs. See illustrations showing how it works, both hands free to move the tire. Users claim it's worth the price of the tool for putting on over sized tires and tires with innerliners. It holds the floating ring back while you are relieving the lock ring—it will not slip off. An extension or protrusion of the yoke which comes in contact with the under side of the rim extending behind the felloe acts as a shoulder, preventing the plunger from slipping off the ring. No other device in the market can use this shoulder. Reversing the tool on the wheel from the inner side forces the shoe off—no matter how badly frozen or rusted, it must come. Adjustable to any size tire.

No. 1 fits up to and including four and one half inches.
No. 2 fits four and one-half inches and over.

OUR GUARANTEE

Your money together with all express charged refunded if O-TAK-A fails to do all we advertise. For sale by all leading dealers. Price $3.00. By Parcel Post $3.28.

O-TAK-A JUNIOR---A BIG SUCCESS

Thousands in use by Ford car owners. A special tool for removing clincher tires. Will take your tires off instantly. Do not go motoring without the O-TAK-A JUNIOR in your kit. See illustrations how it acts. Adjustable to large size clinchers. For sale by all leading dealers. **Price $1.50.**

Parcel Post $1.72.

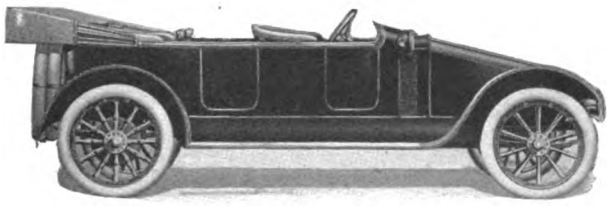
devices, etc., is treated elsewhere in this issue. In conclusion it may be stated that the efficiency of the straight storage battery will depend upon the care given the cells. If the instructions of the maker are followed there is no reason why practical results cannot be secured.

PACKARD CLAIMS RECORD.

Completes 284 Miles from Chicago to Detroit in Running Time of 6:54:00.



What is believed to be a record for sustained road driving under unfavorable conditions was completed recently when William R. McCulla arrived at the Pontchartrain hotel at Detroit with his new Packard machine. He left Chicago, being checked out of the New Southern hotel in that city by J. T. Murphy, the night clerk, at 2:30 in the morning, and at 9:39 he reached the Pontchartrain and was checked in by the clerk of that hostelry.

The distance was 284 miles, which was made in elapsed running time of 7:09:00. There were three stops for gasoline and tires, which occupied a total of 15 minutes. The actual running time, therefore, was 6:54:00, making the average for the entire distance of a little more than 41 miles an hour.

While automobile manufacturers are discussing the advisability of continuing national shows, accessory makers are invited to open a permanent exhibit of their products, to be known as the Auto Centre, in New York City. It is proposed to have each manufacturer in the United States maintain a booth throughout the year, in order to have its product accessible to visitors from every part of the world without the necessity of making a trip to the factory.

John M. Gorham, a New York City attorney, is at the head of the project. He estimates that at least 110 different exhibits will be in place. The idea is considered somewhat novel, but Mr. Gorham is confident that it will accomplish its main purpose to the benefit of producer and consumer.

There's satisfaction both in selling and owning a

Croxton "Six"

The Croxton "Six" offers you exactly what you and your customers want.

It is a car that gives your customers value received for every cent of the purchase price and makes everlasting friends for you.

The Croxton is constructed of the highest quality material and is designed for service. There is not an unnecessary part in the Croxton. It is not burdened with faddish, so-called "talking points" which are seldom good for anyone but the repair man.

You know the service records of Croxton Taxicabs. They are standing years of grinding wear at the hands of careless, irresponsible drivers.

Croxton pleasure cars are made of the same durable construction as Croxton Taxicabs.

The Croxton is made in a full line of models, "Fours" and "Sixes."

The Croxton has an absolutely reliable electric starting and lighting system; full floating rear axle; 140-inch wheel base; six-passenger body; left side drive; center control; four speeds forward, one reverse; demountable Q. D. rims; 36x4 1-2 inch tires; Thermo-syphon cooling system. The radiator is protected from damage and from mud and water splashing by being placed at rear of motor; no hot air from radiator passes over motor; motor protected by hood from dust, dirt and water. Reserve gasoline tank incorporated with cowl dash. The Croxton "Six" fully equipped, **$3,000.**

Our sales force is yet to be completed by the addition of a few good dealers.

Write or wire today for full details and specifications. Ask for booklet A-6. We can put you on the road to a big, healthy boost in your season's business.

The Croxton Motor Car Co.

WASHINGTON, PA.

If We Were Selling Gasoline at Half Price, Would You Buy?

Well! The M & M Economizer will save you from 40 to 50% of gasoline. It will also increase your SPEED and POWER 20% with less gasoline, and less carbon.
READ THIS: Then look for next month's testimonial.

Fort Washington, Penn.
Dec. 3, 1912.

Gentlemen:—I have had your improved M & M Economizer installed on my car, which is a FORD, for a period of two months. I have therefore been able to test it well, and I have received surprisingly good results. I find that I am able to save 40% of my gasoline consumption, as you have claimed. With my throttle set at 15 miles per hour, I am able to increase my mileage to 22 miles, with the same amount of gasoline. I have connected this device up to throttle for speeding, and I use the M & M friction pedal for coasting. I will gladly recommend the M & M to my friends, or anyone seeking information, as I have certainly received satisfactory results from its use.

Yours very truly,

(Signed) WM. R. WENSTROM.

Prime Your Motor

If you have "ALL-IN-ONE" Spark Plugs you can quickly prime your motor and easily start it on the very coldest morning. Easy priming is only one of the advantages given by the "ALL-IN-ONE" Petcock. Open the petcock while the motor is running and all soot will be blown off the sparking points—a true *self-cleaning plug*. Open the petcocks when the motor is missing and you'll quickly detect which cylinder is giving trouble—a *real trouble finder*. Open the petcock and inject a little Kerosene—this is the *best carbon remover* ever tried.

"ALL-IN-ONE" has the best features of other plugs and the Petcock besides.

Price $1.50 each.

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

Let Us Prove It

We Tell You That

BURN-BOSTON =BATTERIES=

TAKE THE PLACE OF DRY CELLS

Reduce Your Battery Expense

ADOPTED BY THE ARMY
ADOPTED BY THE NAVY

Because

BURN-BOSTON BATTERIES (Liquid) DO NOT DETERIORATE WHILE STANDING, and
They are moisture proof, will not leak, dry up or freeze. They take up no more space than dry cells, and are not injured by vibration or rough handling. BURN-BOSTON BATTERIES are not affected by extreme hot weather, or extreme cold.

You Can Depend on Them

THEY GIVE FROM 3 TO 12 TIMES THE SERVICE OBTAINED FROM THE BEST DRY CELLS.
You get the current you pay for, which you never can in dry cells.
Pretty strong claims, you say, but the Army and Navy Departments of the U. S. government tested them for more than a year before they adopted the battery. We have proved OUR claims.

A Few Service Records

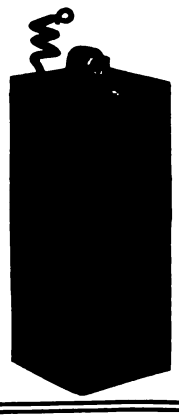
Automobile ignition, 14,000 miles on a set of six cells. No other ignition. Atwater Kent Coil.

Set of six used for starting and auxiliary to Bosch magneto, and lighting three 4 C. P. lamps, for 18 months. Afterwards were used 4 months for starting on another car.

Set of six operated Klaxon horn and gauge light from April, 1909, to date, 5 years.

Set of six ran a tail light and Klaxon horn, beside occasional use in starting, for 5 months.

Motor boat ignition: Set of six ran a single cylinder engine 2 seasons.



Set of four after running a single cylinder stationary gas engine 5 hours per day for 15 months, tested 12 amperes.

Telephone circuit: From 2 to 4 years' service.

N. Y. City fire department use them.

B. & M. R. R. use them.

City of Boston is using them.

OUR OFFER

If your dealer cannot supply you with BURN-BOSTON BATTERIES, drop us a postal asking for our booklet and special offer on a trial order.

EXAMINE
J-M NON-BURN
BRAKE LINING

Note the fine brass wires in every strand. These give J-M Non-Burn added strength and longer life. Note how thoroughly the frictioning materials saturate its every fibre and how strong and compact the lining is woven. Any wonder J-M Non-Burn Brake Lining outwears twelve ordinary linings?

J-M Non-Burn is an all-mineral brake lining, made from the long, tough fibres of that indestructible mineral—Asbestos. Water, oil, gasoline or heat cannot injure it. Will lock wheels of your auto almost instantly.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

> "I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

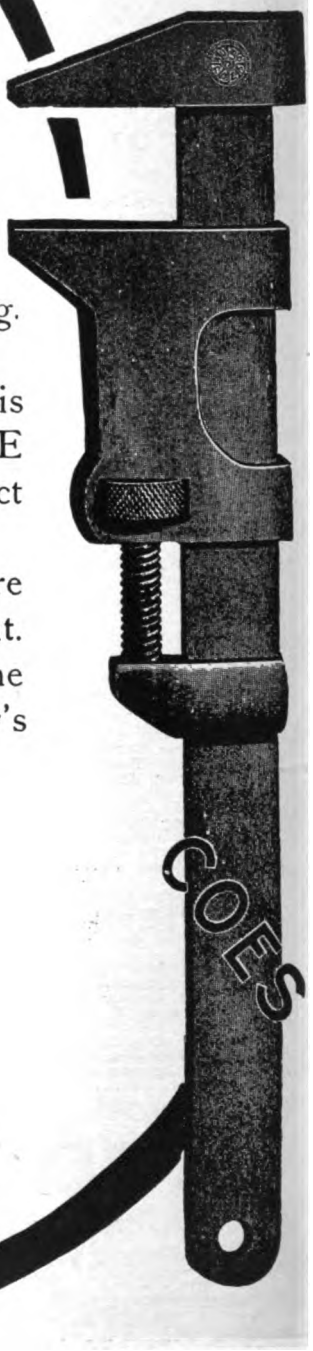
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

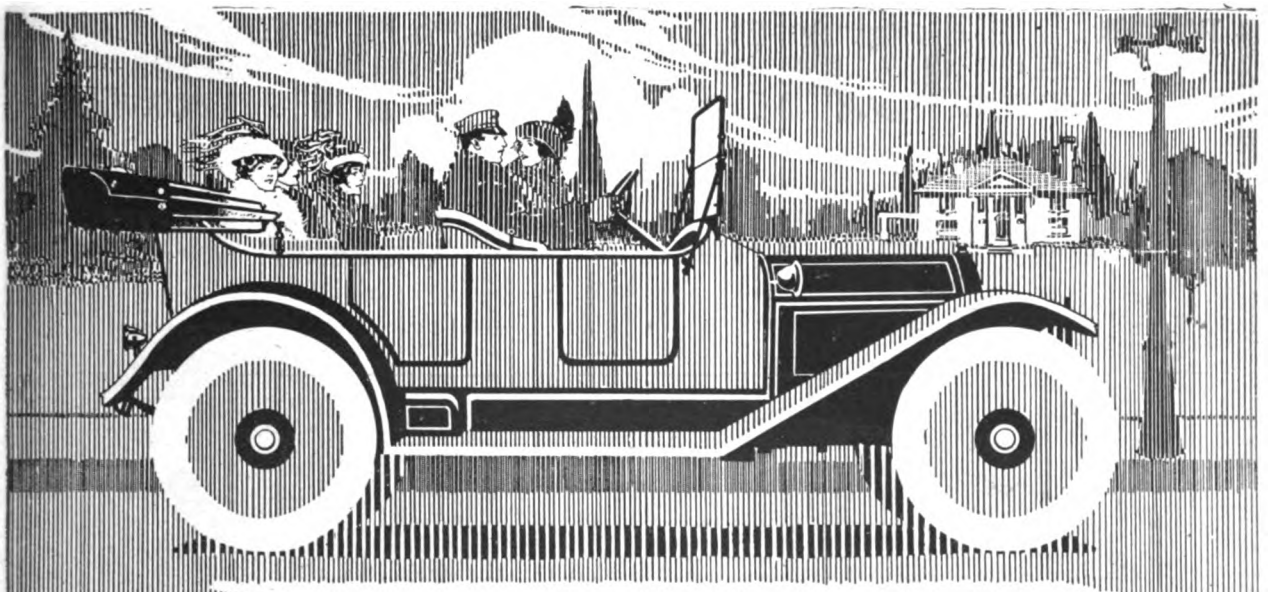
The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)



For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

The Cutting a Car of Extraordinary Value

Cutting

You don't need to be an expert judge of motor car values to recognize the superior value the Cutting offers.

When you see the car you will at once recognize tangible evidence of its extraordinary value.

You will encounter, all over the Cutting, the evidence of experience, ingenuity and of purpose.

You will see them expressed in the features that make for increased comfort; increased convenience and economy of operation; increased safety for the passengers and longer life for the car.

These specifications tell only one-half the story:

Long stroke motor—enclosed valves—self-starter—120-inch wheelbase—larger wheels and tires—deep, rich, luxurious upholstery.

The real Cutting supremacy lies in the organization back of the car—the organization that builds character and quality into every detail of engineering and construction.

—TO THE DEALER—

Dealers who want the biggest sales value in the motor car field should look up the Cutting.

You will be impressed with the unmistakable evidences of value—the things that attract the buyer to the car; that make the Cutting an easy and ready seller.

If you are interested and feel capable of selling Cutting cars do not hesitate, but get in touch with us at once.

We can offer you good territory that will assure lasting and profitable business.

Write or wire for complete information.

1913 MODELS

B-40—Five-passenger touring car $1475.00.
A-40—Two-passenger roadster $1475.00.

The same chassis is used for both models, the bodies being interchangable. Electric starter and lighting system will be installed on either model at a slight additional cost.

All models fully equipped.

WATER COOLED MOTOR **CAMERON** FOUR SPEEDS FORWARD

"30"

5-Passenger Touring Car (Fully Equipped) $975

A distinctive car that has power, speed, durability, comfort, easy riding, and above all is ecomomical. The work of a master mind.

The Cameron motor is the **mechanical sensation** of the season. The engine is 3 5/8 bore x 5 in. stroke and delivers 30 H. P. It gives remarkable power and efficiency because it has side valves in the head with no pockets.

Another feature used only in cars selling from $4000 upward, is the four speeds selective type of transmission. Four speeds forward with a direct drive on all speeds.

The **car** is **cranked from** the **seat.** The crank is on the dash. This is connected by a chain to a gear that meshes with a gear on the fly wheel. This gear is slid into mesh with the fly wheel by a small foot pedal for starting, and throws out automatically. It requires little effort to start the engine.

In appearance the **Cameron** has a decided foreign aspect. It is low hung with a pointed radiator.

SPECIFICATIONS

MOTOR. 4-cylinder, 3⅝-in.x5 in., water-cooled.
VALVES. Rocker arms all on one side, driven from one cam shaft.
LUBRICATION. Automatic oiling system.
IGNITION. Splitdorf magneto, dual, throttle on top of steering wheel.
GASOLINE TANK. In cowl, 22 gal. capacity.
CLUTCH. Leather-faced cone on fly wheel, self-adjusting. Clutch pedal also operates brake.
TRANSMISSION. Cameron System, direct drive on all speeds, obtained selectively. Located on rear axle, operated by hand lever, four speeds forward.
TIRES. 32x3½-inch.
AXLES. Front, nickel steel tubular; rear, full floating type, annular ball bearings.
BRAKES. 12-inch internal expanding, with 2½-inch braking face, emergency brake operated by lever, operating brake attached to clutch pedal.
SPRINGS. Front, semi-elliptic; rear, full elliptic with scroll.
WHEELBASE. 112-inch.
CONTROL. Centre.
DRIVE. Left-hand.
RADIATOR. Tubular, almost double cooling capacity.
CARBURETOR. Kingston.
COOLING. Thermo syphon.
LAMPS. Gas or electric with Prest-O-Lite tank or battery.
STARTER. Starts from seat.
EQUIPMENT. Best silk mohair top, side curtains and top boot windshield, complete tool kit and tire repair outfit, pump and jack, speedometer, head, side and tail lamps.
BODY. Two or five-passenger.
WEIGHT. Approximately 2,200 lbs.
PAINT. Black with red or gray running gear, with similar striping.
WIRE WHEELS. Optional at $20 additional.
PRICE. $975 F. O. B. Beverly.

CAMERON MFG. CO. Beverly, Mass.

The Economy of Quality

¶ If you are going to sell your car in a few days, you can use any old oil and let the other fellow pay the subsequent repair bills.
But if you expect to run your car three thousand miles further—

INVADER OIL

will save you money and give you a better car to sell—or keep.
¶ Invader Oil may cost a little more to buy—but it's by far the cheapest oil to use

We Pay a Premium to Secure the Finest Quality of Asbestos—

When you buy RAYBESTOS, you get brake lining made of the highest grade of asbestos for which we pay a premium. Low grade asbestos has never been used in making RAYBESTOS and never will be used —that's one of the big differences between RAYBESTOS and "ordinary" brake lining.

If you want safety, wear, coefficient of friction and quality demand and insist upon the QUALITY lining—

TRADE MARK Raybestos REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

RAYBESTOS Brake lining possesses the highest coefficient of friction—it "grips," it holds, it prevents accidents. Demand and insist upon getting RAYBESTOS. The name is stamped in every foot of lining to prevent substitution. Ask your dealer. Comes in all widths. Easily attached.

20 Miles to Gallon

Planhard Co.: Lawrence, Mass., July 13, '12.

Gentlemen:—Enclosed find check for carburetor. I feel perfectly satisfied. It does 20 miles and over on a gallon. Can recommend it to any one. G. A. SCHMIDT.

Two Years Without Adjustment

Brenham, Tex., June 29, 1912.

Gentlemen:—Do you furnish extra gasoline needle valve for the "Planhard" carburetor? If so, please let me know what the price is. I have been using your carburetor for two years on a Sheffield motor car, and it is the first repair it has ever required. R. WEBB.

Cadillac Owners

Edgewater, N. J., May 21, 1912.

The Planhard Mfg. Co.

I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction **over nineteen miles** to the gallon. This is on my Cadillac.

Yours very truly,

JOHN H. HINNERS.

Ford Owners

Chicago, O., July 1, 1912.

Gentlemen:—Enclosed find draft to pay for "Planhard" carburetor for my model S Ford car. It is very satisfactory; in fact, I have never bought anything for the car that I paid so cheerfully for, as I have a smoother running engine with more power, and get **more mileage per gallon** of gasoline, and my engine runs much cooler.

H. W. GRANDON.

Gallon Less Per Hour

THE GRAY & PRIOR MACHINE CO. (Portland, Me. Branch)

Gentlemen:—I used one of your Planhard carburetors on the 20 H. P. model X, Hartford motor, in my semi-speed boat, "Hartford III," during the season of 1912. My boat is well equipped to make tests, as I use a **tachometer.**

I get better control with a Planhard and use practically **one gallon of gasoline less per hour** than when I used one of the most popular carburetors in use today. I have put a Planhard on my automobile as well. A. N. SMITH.

Improve Operation

SHERIDAN (Ind.) GARAGE.

Planhard Co. July 8, 1912.

Gentlemen:—Herewith find check. The carburetors are O. K., displacing two others of well known make, and improving operation of car.

H. B. JOHNSON.

Superior to Ordinary

HOWE & MEEHAN,

Wellesley, Mass.

Gentlemen: — Please find money order inclosed. Carburetor is far superior to the ordinary. Very truly yours,

W. E. MEEHAN.

3 3-4 More Miles Per Hour

When Planhard carburetors were put on the 6 cylinder 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M. and 3¾ more miles per hour.

More Speed on Goshen Engine

Planhard Mfg. Co. Groton, Conn., Feb. 8, 1913.

Dear Sirs:—I have put a Planhard on my single cylinder 6-8 H. P. Goshen Engine. It is ahead of anything I know of. It gives 50 R. P. M. more than the ——— I took off. With the Planhard I can start cold or hot without priming, which few others can do. Yours truly, E. A. SCRIVEN.

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others, and it would develop much more power when pushed." H. D. Bacon, President.

"Fifty miles without a miss."—Geo. E. Grosvenor, Crescent, Mich.

"To use the vernacular, 'some carburetor.'"—W. R. Fleming, 3311 Broadway, N. Y.

"Has them all beaten to a frazzle."—A. G. Linden, Cleveland, Ohio.

Here's a lesson for all new owners of cars--especially new owners of new cars

We want to reach you and teach you before you start your motoring career.

Know this: A motor car is essentially a power plant plus a system of shafts, bearings and gears. The real wear which disables and destroys, falls upon these mechanical units. Beautiful paint and upholstery can fade or crack but still your car remains a valuable machine if the working parts are true and silent in operation.

The car manufacturer puts his brains and money chiefly into these working parts---bearings and gears. That is where you must use supreme prudence and care if you wish long service from your car.

Lubricate every bearing systematically with NON-FLUID OIL.

That is advice reiterated now for fifteen years---advice which has helped thousands and thousands of motorists to realize service value from their car investments.

It is advice which has been strengthened and spread by over seventy manufacturers of cars who have tested the failure of other lubricants and proved the success of NON-FLUID OIL.

We cannot prove to you with bald statements that NON-FLUID OIL reduces friction to a harmless degree nor that it removes the nightmare of wear and tear. Friction diagrams, chemical shop talk, claims, comparisons, disparaging statements about other lubricants---all these things are a worthless means to urge conviction upon you.

We simply invite you in your own interest to use NON-FLUID OIL this first year.

If your dealer does not sell it, you will have to look elsewhere. Don't be tempted to accept another kind of lubricant. Don't do it. Be sure you get genuine NON-FLUID OIL packed in orange colored cans bearing this trade mark.

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE NON-FLUID OIL

Get it surely, or write us for it. We will ship it prepaid and arrange for your future supply with some dealer who will carry a stock.

NON-FLUID OIL is made in several grades and is sold in 3 lb., 5 lb., 10 lb., 20 lb. and 50 lb. cans.

K-000 Grade—for all the grease cups, for universal joints, steering knuckles, wheel hubs and for differentials requiring a heavy lubricant.

K-00 Special Grade is for sliding gear transmissions and for differentials which are oil tight. This lubricant has been so exceptionally successful for gears that it is regarded as a standard for this work. Other grades for timing gears, pump, etc.

Read "Lubrication of the Motor Car."

This is a complete treatise on lubrication, including a splendid LUBRICATING CHART.

Write us for free copy. Read carefully. Address Motor Dept.

GAULOIS TIRES

challenge comparison

Equip your car with two tires of whatever make you consider the best and with two GAULOIS tires. We will abide by the result.

GAULOIS TIRES

(Pronounced GOAL-WAH)

represent the utmost in Mileage, Comfort, Strength, Resiliency and Durability.

Wherever pitted against tires of other makes—at the International Expositions of Paris, Turin, Hanoi, St. Louis, Milan, Liege, London, Saragossa, Quito, Brussels, Buenos Ayres—they have invariably triumphed. They differ from other tires, as a three dollar shoe differs from a seven dollar shoe. GAULOIS tires cost a little more to buy but a great deal less to use.

They wear better, they run better, they look better, and *they are better.*

They are made for that discriminating class of motorists who appreciate the economy of quality.

Apply Your Business Methods to the Buying of Your Automobile Lubricants

and you will use

EMCO
Motor Oils
and
Greases

are refined from Bradford Crude, free from all animal and vegetable matter, contain no acids, and their ideal consistency is never affected by heat or cold.

YOUR
Guarantee

If Emco Automobile Oil does not prove satisfactory to you in absolutely every respect, we will refund your money in full, pay freight (both ways if oil is returned), and make no charge for oil used in trial.
Order in five or ten-gallon cans, or barrels or half barrels.

You insist upon highest efficiency in your business. Whether you call it Scientific Management or something else, you demand that every cog in the machinery of your business shall work in harmony with all the others. The knowledge that such a condition exists gives you peace of mind.

Then why discard all those methods which have made your success when you leave your business. Do you know, for example, whether the lubricants used on your motor car are best by test? Do you know that they are permitting your car to give the highest efficiency of which it is capable? Do you know, or are you simply buying some brand that has only extensive advertising to recommend it? Why not carry the certainty of your business methods into this vitally important matter?

Of course we are selling Emco Automobile Oils—but we are not only willing, but anxious to have you prove them at our own risk. See above guarantee.

Emery Manufacturing Company

TYRES

LOOK FOR THAT SIGN

NOW BEING DISPLAYED BY ALL LEADING DEALERS AND GARAGES

STRONGEST POSSIBLE PROPOSITION FOR TYRE AGENTS

European manufacturers are conservative and slow to give their unqualified endorsemen to a product before they have thoroughly investigated it.

ENGLEBERT TYRES are being used by thousands of satisfied motorists in Europe because they have proved by actual performance that they will not blow out or rim cut. They are being adopted as standard equipment by the leading European manufacturers because of the quality of their rubber, the honesty of their construction and the tire mileage that they actually give.

ENGLEBERT TYRES cost no more in the initial outlay than any American made tire, and they give 50 per cent. more tire satisfaction.

All that the tire industry knows is built into the ENGLEBERT TYRE.

THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 4 MARCH 25, 1913 Price, $1.00 the Year

BOSTON SHOW PRODUCED BIG BUSINESS.

Everybody Made Sales, Including the Accessory Exhibitors---Largest Attendance in the History of the Industry---New England Loyally Supports Dealer's Display--Beauty of Decorative Treatment Exceeds Past Efforts.

BOSTON has given the motor car industry another splendid surprise. If the Boston automobile show still acts in the capacity of a barometer with respect to the year's business, then 1913 is to be the most prolific year in the history of the industry. The term biggest and best hardly seems sufficient to describe the results disclosed at the 11th annual pleasure car display, which came to an end in Mechanics' building March 15.

General View Across Grand Hall, Mechanics' Building, During Boston Pleasure Vehicle Display, Showing Beauty of Decorative Scheme.

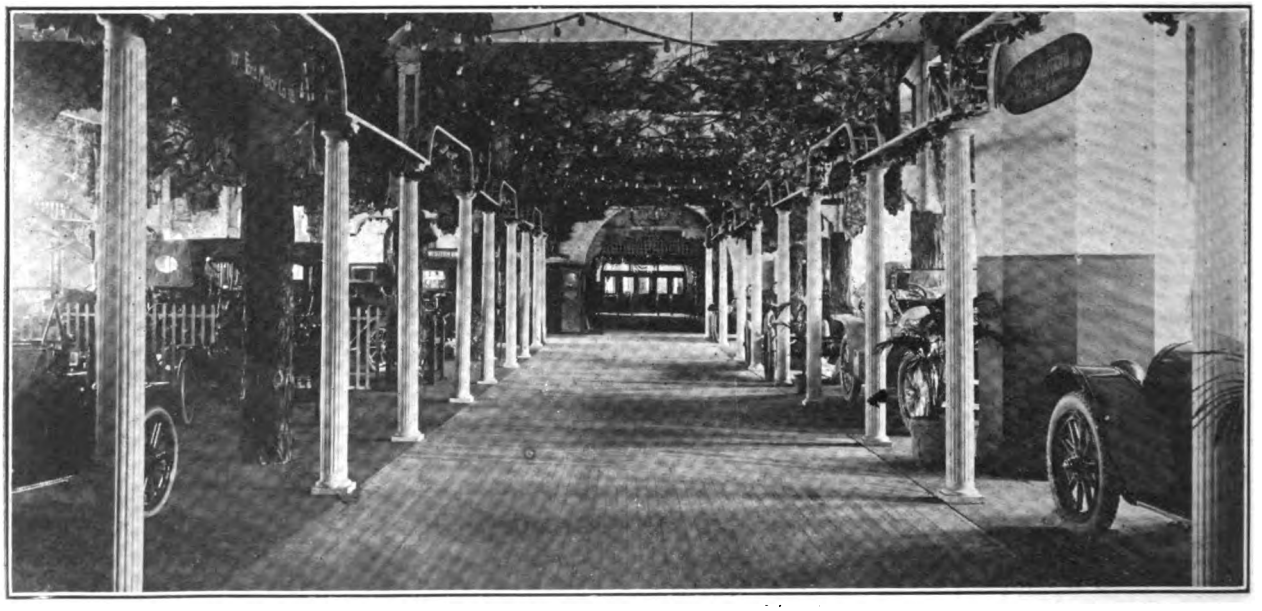
The situation is one which does not admit of a ready explanation. When the national show in New York closed Jan. 18, it was freely predicted that the volume of sales in Boston would be decidedly less than in former years. This undoubtedly was based upon the results obtained in New York, since many manufacturers have expressed themselves as very much disappointed over the business transacted at that exhibition.

A month later the national show in Chicago achieved a new record in number of sales. Several makers report that the amount of business done in that city was such as to bring about a change in opinion with regard to the advisability of continuing the policy of exhibiting directly. The increased volume of sales in Chicago was

Digitized by Google

Looking Toward the Stage in Grand Hall, Representing View Through Palace Entrance.

taken to mean that the future market for automobiles would be found in the Middle West instead of in the East.



The Boston Automobile Dealers' Association, and Chester I. Campbell, its veteran show manager, maintained that these results only served to prove their contention that the proper time to hold a motor car exhibition was just previous to the opening of the actual driving season. A new phase of the situation appeared this year, in the discussion respecting the relative merits of the national and the local dealer's show. Boston and New England appear to have been anxious to demonstrate that a local dealer's show held in the spring of the year just before the opening of the driving season presents the best possible combination for results.

It is only necessary to talk with manufacturers of cars and accessories, some of whom assisted in the Boston display with a decided degree of reluctance, to realize the splendid success achieved this year. And the most surprising feature of all lies in the fact that practically every accessory exhibitor feels that he secured his full share of the business of the week. The only exceptions are those few instances where the unfortunate limitations of even such a large structure as Mechanics' building compelled the exhibitor to accept what he regarded as a somewhat undesirable location.

More than 245,000 people visited the show.

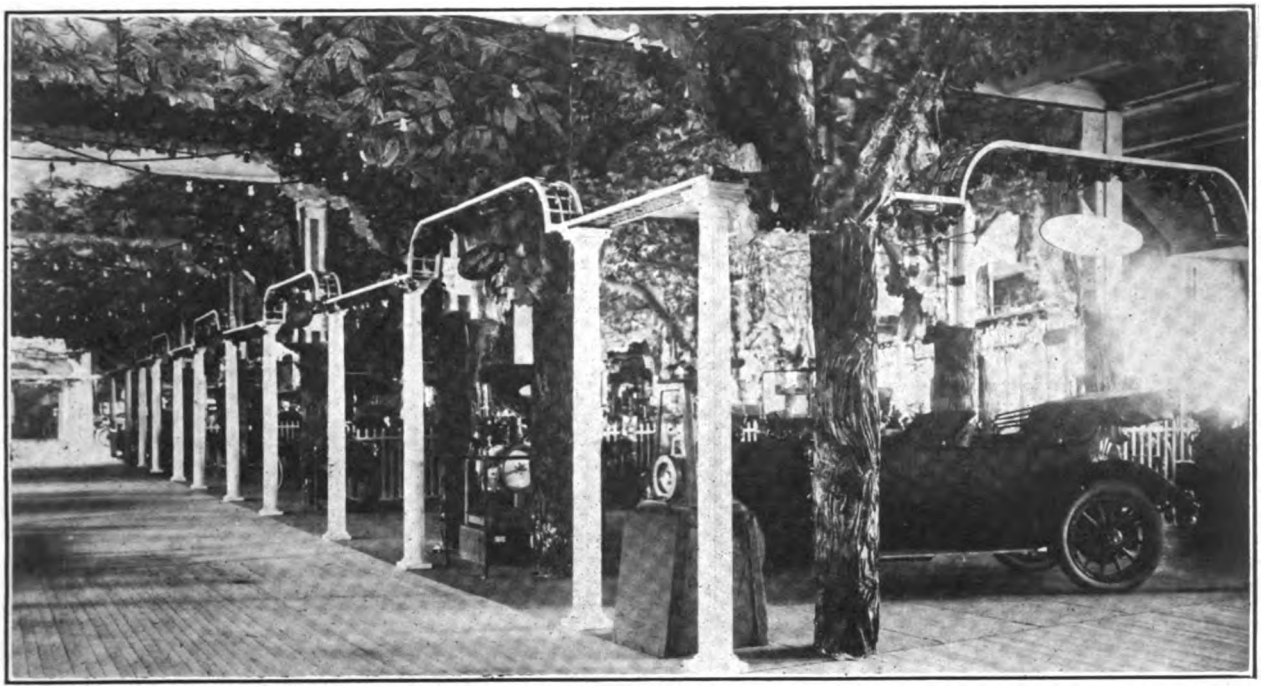
Looking Down One of the Aisles in Exhibition Hall, with Marmon Display at the Left and Pope-Hartford Machines on the Right.

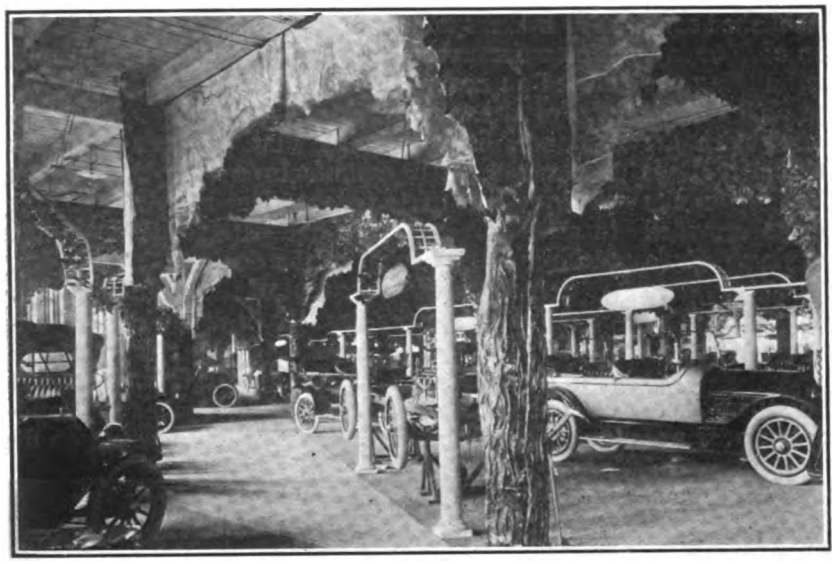
Digitized by Google



New records for attendance were established each day and evening, with the exception of Monday. Forty thousand persons entered the building the opening night, without counting the 3200 exhibitor's passes issued to those connected with the various displays. Wednesday was Society Day, and usually this has been the lightest day of the show. This year the building was crowded throughout both afternoon and evening. Even larger crowds appeared Thursday and Friday, and on the last day Huntington avenue was filled with people waiting for the doors to open at 10 in the morning.

Perhaps it was because many of them have been attending the Boston show every year until they are well known by the dealers, or it may have been a concerted effort on the part of the people of Boston and New England to assist the Boston Automobile Dealers' Association in demonstrating its point with reference to the biggest and best exhibition. Certainly, there was something about the crowds which seemed to convey an impression of mutual interest in the success of the display.

Last year, it was estimated, after a canvass of the exhibitors, that business amounting to very nearly $2,000,000 was closed during the week. A like canvass this year indicates an even larger volume of sales, and of course there were many "prospects." With respect to the accessory makers and dealers, one concern, which has a manufacturer's proposition, purely and simply, closed an order which netted $40,000. This was one of the companies which exhibited with reluctance, little thinking that business could be transacted with manufacturers at the Boston show. An entirely independent record was made in sales of accessories and fittings calculated to make a direct appeal to the owner.



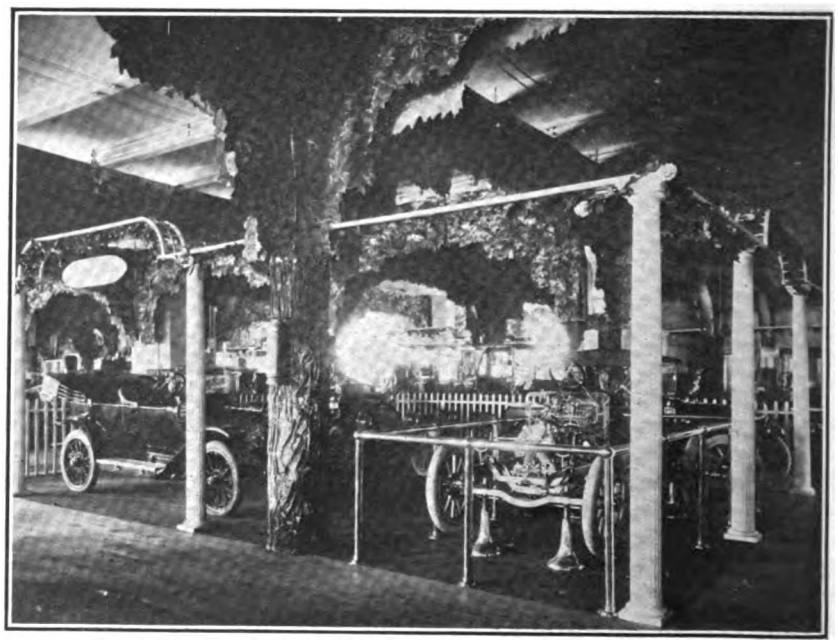
Some idea of the extent of the exhibition may be gained from the fact that there were 107 different makes of cars and 1116 separate kinds of accessories disposed about the 105,000 square feet of space on the three floors of Mechanics' building. These figures are from the contracts on file with the management and indicate the most representative showing of automobiles and fittings ever assembled under one roof. In addition there was a creditable showing of motorcycles, although not as large as it should have been considering the market afforded, and an increased number of machinery exhibits. If a suggestion may be pardoned in this connection, it would prove of value to the motoring public if it were possible to secure additional exhibits of this character another year.

As a spectacle, the display was remarkable for its beauty. Accompanying illustrations but faintly portray this view of the show. In Grand hall the conception of the Hanging Gardens of

The Old Fashioned Garden of a Century Ago, as Seen from the Entrance to Exhibition Hall, with Columbia and Maxwell Cars in the Centre.

Digitized by Google

Still Another View of the Old Fashioned Garden, with Speedwell Display Prominent.



Babylon was admirably worked out. On the main floor the cars were grouped among the lofty palm trees in such manner as to cause the observer to make a mental comparison between the grandeurs of ancient Babylon with the luxurious simplicity of one of the wonders of the 20th century.

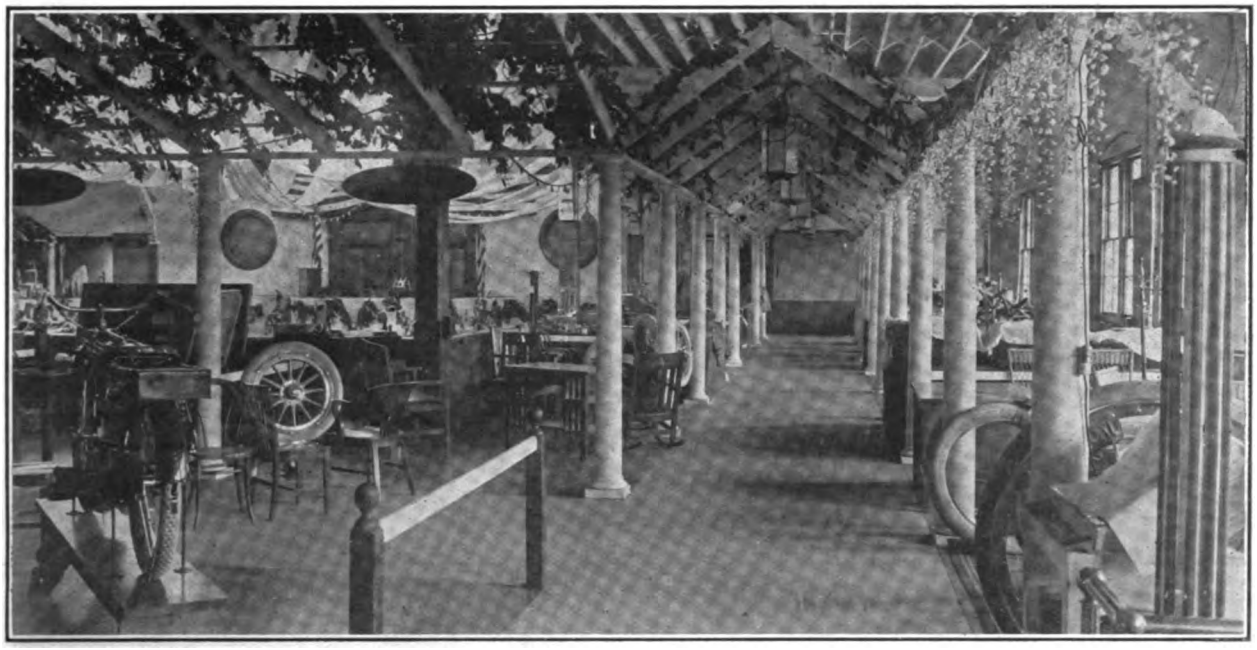
The old fashioned garden of a century ago in Exhibition hall was another splendid artistic treatment. Here the cars were arranged in an immense shaded bower, the various exhibition spaces being divided by picket fences, through the pickets of which the old fashioned hollyhocks and other flowers peeped at the visitor in a most fascinating manner. It was in this portion of the display that some of the most interesting specially designed bodies were to be seen, each with its special setting calculated to impress the beholder with the particular type of beauty.

Down stairs in the basement —that portion of Mechanics' building which always has been conceded as practically impossible of responding in a satisfactory manner to the wizardry of the artist—several cars were to be seen amid surroundings every bit as attractive as those on the main floor. Some of the specially designed bodies were to be found here as well. Of course, the machinery exhibits were to be found in the basement, and a large number of accessories besides. And here also were the motorcycles.

Upstairs, where most of the accessory displays were made, was treated with greenery and bunting wherever it was possible to use them judiciously. And it is surprising how attractively such commonplace articles as oils and tires may be arranged to assist in the decorative scheme.

In considering the display of cars, comparisons must be made with the national exhibitions in New York and Chicago. Eight makes were seen for the first time this year at a show in any way approaching this magnitude. These were the Ford, K-D, Kelsey, Moyer and Nyberg gasoline machines; the Bailey and Grinnell electrics and the Stanley steamer. At least one, the K-D, made its first public appearance. Thirteen makes were shown for the first time in Boston, these being the Chevrolet, Davis, Detroiter, Edwards-Knight, Henderson, K-D, Little, Marathon, Michigan and Moline gasoline; Borland, Grinnell and Standard electric.

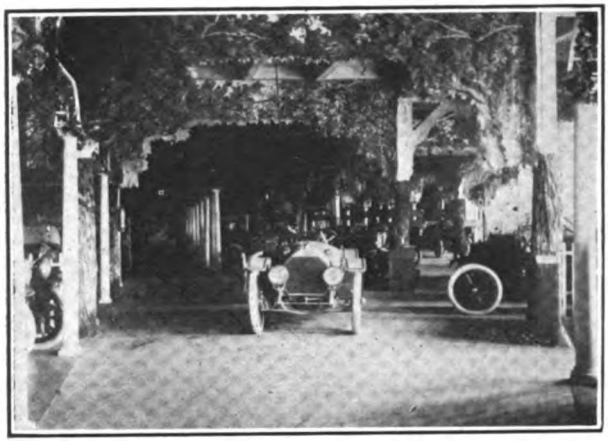
One of the Individual Gardens, in Which the Overland Line Was Exhibited.



Digitized by Google

The Ford Motor Company, Detroit, has changed its product somewhat in the method of reinforcing the rear axle system, and several refinements were noted in the body construction and arrangement of details. The six-cylinder Moyer, made by H. A. Moyer, Syracuse, N. Y., has been redesigned, although possessing many of the characteristics presented in its first appearance in Boston a year ago. The four-cylinder car also is changed by the addition of an electric lighting and starting system, at least. The Kelsey motorette had the distinction of being the only three-wheeled machine in the show, without counting the motorcycles of course, and was presented as a new roadster, with a two-cylinder, four-cycle, opposed engine and other changes in mechanical details. The Nyberg is made by the Nyberg Automobile Works, Chicago, and is now produced in four models, two with four-cylinder engines and two with six.

S. R. Bailey & Co., Amesbury, Mass., presented the Bailey electric line, including a new roadster model. As heretofore, the cars are designed to use the Edison battery exclusively. The Grinnell, made by the Grinnell Electric Car Company, Detroit, also appeared in a new model, a clear vision brougham in which all five passengers are seated so as to face forward. The Stanley, made by the Stanley Motor Carriage Company, Newton, Mass., was the sole representative of steam propulsion. The latest addition to the line is a machine utilizing a smaller engine than the others, rated at 10 horsepower.



Aside from the K-D, which is entirely new and is considered in more detail elsewhere, there were several models of the better known cars which presented slight changes since the line was exhibited at New York and Chicago. In most instances these were in the nature of minor refinements, either in the design of the body or in the attachment of the fittings. It also was noticeable that several manufacturers had made provision for an electric lighting and starting system, either as standard equipment or at the option of the purchaser. At least two well known makers, the Packard and Lozier, have joined the list of those supplying machines with left hand driving position.

Perhaps the most noticeable innovation was the use of an electric gear shift on the S. G. V. While the speed changing lever is still retained and supplied with the car for use by the owner if preferred, the new model carries a series of push buttons on the wheel. The transmission affords four forward speeds and reverse, so that there are six buttons, one of these being the neutralizer. Pushing the proper button arranges suitable solenoids so that a pressure of the clutch pedal completes the circuit and the gears are meshed. This applies to each of the forward speeds and the neutral position, but the reverse is secured mechanically, through the use of a cam.

Where the Accessories Were Arranged About the Light Well in Exhibition Hall, Showing Attractive Decorative Scheme in That Section.

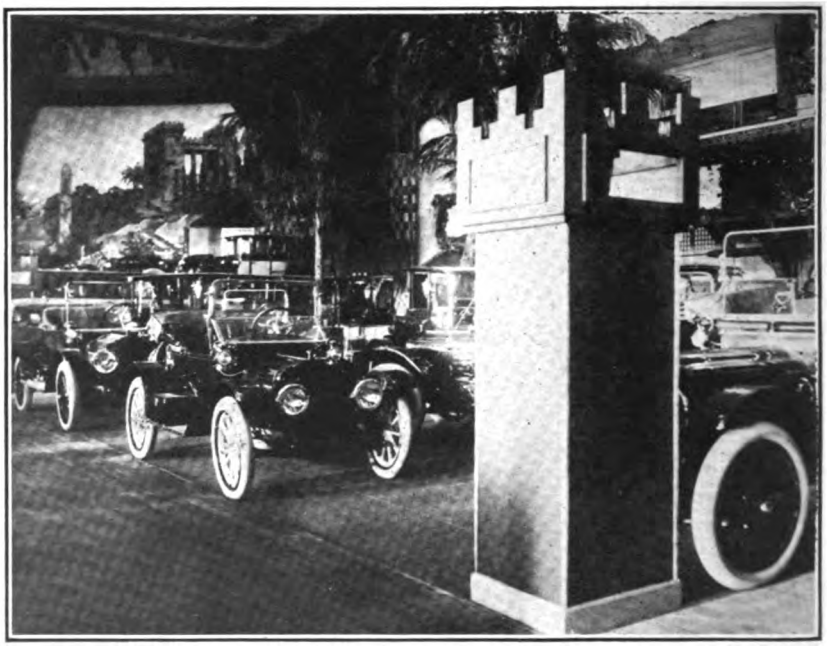
Digitized by Google

Indicating Shaded Bower in Exhibition Hall, with Lenox Display in the Foreground.

The display of accessories was the most complete that has been seen at any show this year. A few well known lines which were not represented at either New York or Chicago were shown by local dealers and branches, while the list of strictly new fittings and supplies was much longer than at either of the national exhibitions.

BOSTON IMPORTERS' SALON.

Many Foreign Cars and Some American Makes Displayed in Copley-Plaza Hotel.



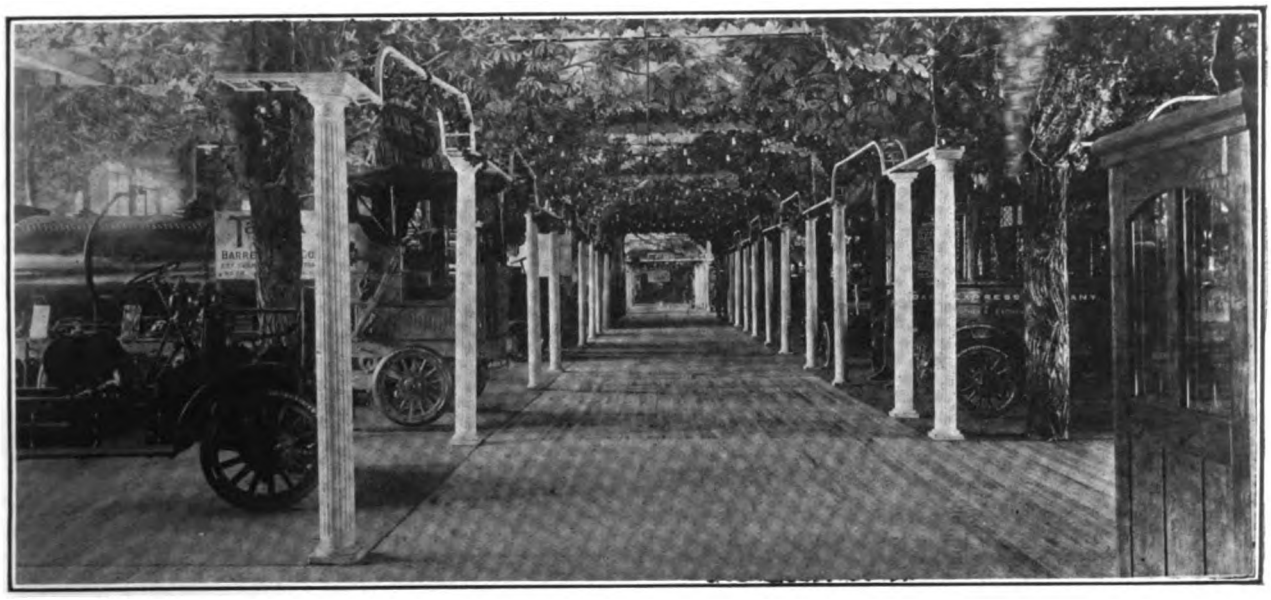
For the first time in its history Boston experienced an Importers' Automobile Salon, the dates selected being those conforming with the annual show of the Boston Automobile Dealers' Association. The event was staged in the grand ballroom of the Copley-Plaza hotel. Several foreign makes and a few American machines were displayed in such manner as to call special attention to the body equipment, although one or two of the foreign chassis were shown separately.

In many respects the salon was similar to that which was held in the Hotel Astor, New York City, just previous to the opening of the national show in Madison Square Garden and the Grand Central Palace. Practically the same cars were seen at a salon in Philadelphia during the progress of the annual dealer's show in that city.

The foreign makes displayed were: Benz, Metallurgique, Lancia, Isotta Fraschini, De Dion-Bouton, Minerva and Mercedes, representing Germany, Belgium, France and Italy. The American machines were: Two Hendersons and one each of the Keeton, Simplex and Peerless. The last named was located in the corridor, and like the others was particularly rich in its body appointments.

In one respect at least, the display of the Cataract Rubber Company at the Boston show was particularly unique. Cataract tires for both pleasure cars and trucks were seen for the first time, but the central feature was the handsome painting by William Harnden Foster, valued at $1000 and conceded by art connoisseurs to be the best reproduction of an automobile racing scene ever attempted in oil.

From New York City to Cleveland, O., by way of Philadelphia and Pittsburg, Penn., crossing seven ranges, including the dreaded Cone mountain of the Cumberland range, and covering a distance of 590 miles over winter roads in 26:23:00 actual running time, was the test recently given the new Chandler six-cylinder car by Engineer Whitbeck and Sales Manager Emise. The new machine is being manufactured at Cleveland by the Chandler Motor Car Company. It's initial announcement was made at a private display during the recent show in Chicago.



The White Corner in Grand Hall, Indicating Details in the Artistic Treatment Employed.

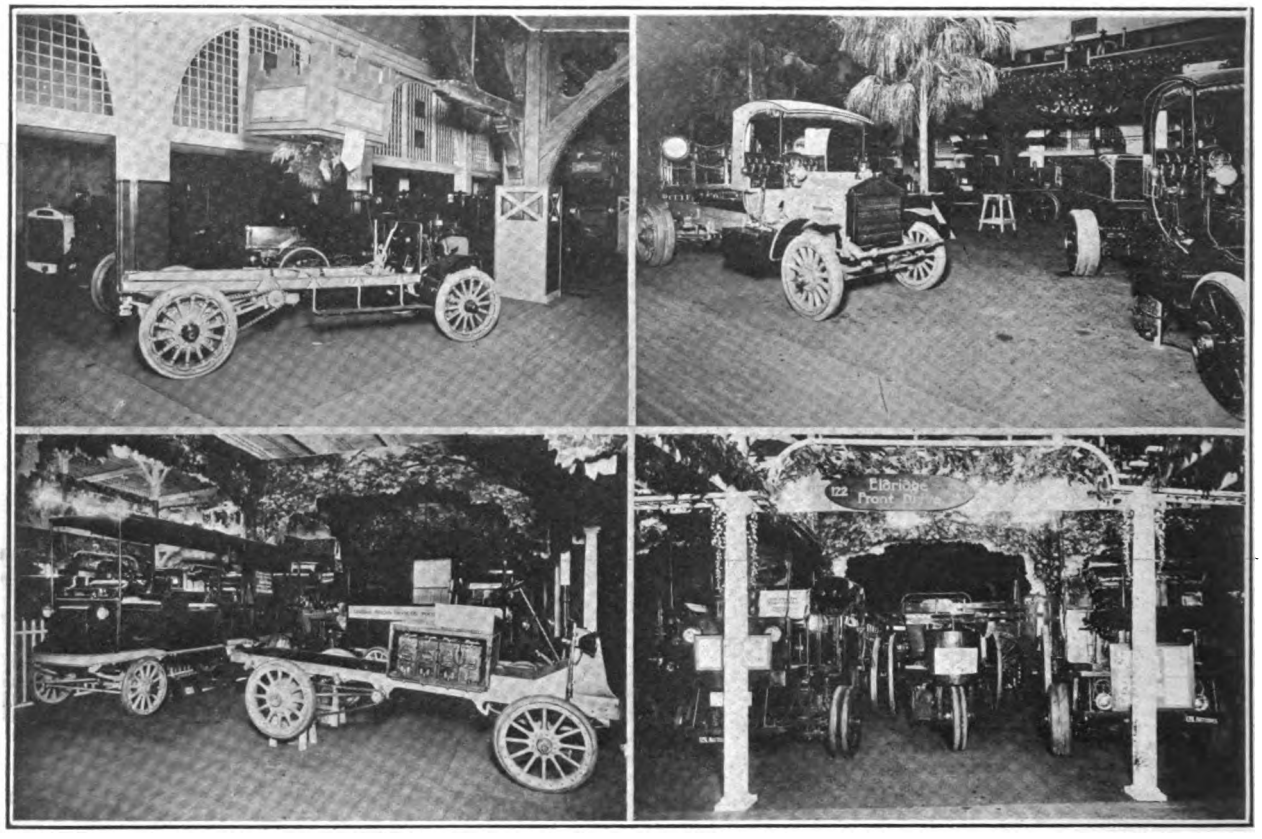
BOSTON'S COMMERCIAL VEHICLE DISPLAY.

THE annual show of the Boston Commercial Motor Vehicle Association, which was opened at Mechanics' building, Huntington avenue, the evening of March 19, and which will be concluded March 26, is unquestionably the best exhibition of service vehicles ever made in Boston, and is expected to be the most productive of any display ever held in America. The show has not as many exhibits as were seen at either New York or Chicago, but it is made up of the best known machines in the industry, and it has a quality that is uniformly higher than was seen at any of the previous displays of the year. It is not an exhibition of freaks or innovations, and practically every vehicle, even those shown for the first time, conforms to engineering standards and conventional design.

View Along the Main Aisle in Exhibition Hall, Mechanics' Building, During Boston Truck Show.

If there was one thing more than another impressed upon the manufacturers and their representatives at the show, and with comparatively few exceptions the makers were represented during the early part of the exhibition, it was the unusual interest manifested and the actual transactions consummated. The attendance thus far has been such as to indicate a total more than double that of the 1912 show and it can be stated conservatively that there were very few attracted by curiosity and not by business motives.



From all sections of New England came the visitors, and the number from outside of Boston and the suburbs was surprisingly large. The majority were business men who desired to learn from observation of the machines and personal examinations what information was desirable relative to equipment that might be contemplated, and the knowledge possessed by many was conclusive evidence that the subject of motor vehicle transportation was being investigated carefully and thoroughly. Those who did not know something of the machines of the type they believed might be adapted to specific service were comparatively few, and many had detail information of a number of machines that indicated careful study and analysis of each vehicle.

The show is in the splendid setting of the pleasure car exhibition that preceded it, and from this point of view might be interesting to those who attend from curiosity, but while the majority of the vehicles are those displayed elsewhere and are clean and polished, there is a decided contract between the beauties of a hanging garden or a forest and the machines that are designed, with rare exceptions, for the hardest kind of road work. The musical programmes of the orchestras and the solos of singers were entirely lost in the buzz of the motors operating the dumping bodies and the earnest conversation of the visitors.

The exhibition of tractors is not large, it being confined to the Knox-Martin machine, which has been a standard in the market for two years or more, and the Couple-Gear gasoline-electric,

Digitized by Google

which is one of the first machines of this type built in America. One reason for this, however, is that there are but few makers in the country producing vehicles of large carrying capacity. The Knox-Martin tractors shown are two in number, with and without a body. The latter is equipped with a trailer of large capacity with stationary body with chute discharge at either side, this being designed for use in comparatively narrow streets and to comply with the exacting traffic regulations of some of the cities where the traffic is congested. The Couple-Gear tractor is fitted with a trailer built for the use of a large Boston lumber firm and is of a size that will carry 8500 to 9000 square feet of board, and so designed that the load may be dropped in two or three minutes.

A Few of the Individual Exhibits: Upper Views, Left to Right, Bessemer and Pierce-Arrow, Both in Grand Hall; Lower, G. M. C. and Eldridge and Couple-Gear in Exhibition Hall.

The machines with quick unloading bodies are of large size and intended for use by firms handling coal, gravel, sand, building material and the like, and these range from three to five tons in capacity. These are fairly numerous and among them are the Pierce-Arrow, Peerless, Packard, White, Speedwell, Locomobile, Velie and Alco trucks, all of which were shown at New York and Chicago, and of these the Pierce-Arrow, Peerless, Packard, White and Locomobile are fitted with power hoists. In addition to these at the G. M. C. stand is shown a miniature Lally body that is equipped with a manual hoist of new design. Manual hoists are also shown at the Peerless, Packard and Alco stands.

The majority of the bodies shown with the smaller vehicles are of the platform, express and enclosed types, and these are in many instances what may be regarded as standard constructions. The brewery trucks are also numerous, one that attracts much attention being on a White chassis that has a very high crate body, which may be used for both barrels and racks. This may be regarded as a combination design.

Of the new machines, shown for the first time, one of the most interesting was the two-ton, single-wheel driven Eldridge dumping body cart, built for the Metropolitan Coal Company of Boston. This is the second one of the kind constructed, the first being used by a New York concern with considerable success. The cart has a special forebody that has a single Couple-Gear wheel, which is driven by a three horsepower motor, and is carried in a massive cast steel fork, which is mounted much the same as is the for-

Digitized by Google

ward wheel of a bicycle. This fork is operated by a large hand wheel and may be turned to any angle desired. The forebody is carried on a large collar and has a very large bearing. There are no springs and the dual solid rubber tire is regarded as sufficient to absorb practically all the road shocks. The usual Couple-Gear wheel is mounted on an axle stub on which the wheel revolves, there being a large bearing in the inside disc of the wheel, and generally the stub is so pivoted that it may turn in a yoke in the axle end. In this case the axle extends through both discs and is anchored in the fork ends, but the drive is unchanged in principle.

The single seat for the driver is mounted on full elliptic springs and is free from jar. The battery cradle is mounted directly behind the front wheel and this is carried on helical springs that protect it against road shock. The springs are placed at the corners of the cradle and the guides prevent any throw of the battery. The rear of the forebody is extended so that the platform rests on the dead axle supported by large wheels shod with steel tires, and on this platform is a pair of trunnions on which a metal body of two tons capacity is mounted, helical springs being placed under the body to maintain it rigidly when being driven light.

The Sowers machine is rated at 3000 pounds capacity, and the first chassis is exhibited. It is built by the Sowers Motor Truck Company, a Boston concern, and it is the design of Charles Basle, who was noted as driver of racing cars in this country and abroad. The machine is in no way radical, and it very generally follows standard practise, but throughout the construction is heavy and an unusually wide margin of safety is noticeable. The chassis exhibited is a seat above the motor type, and this has a 120-inch wheelbase. The body is designed to give a loading space 126 by 72 inches. The seat behind the motor type has a wheelbase of 140 inches and the same loading space.

The motor is a 25 horsepower Wisconsin, with bore of 3.75 inches and stroke of five inches, having an S. A. E. rating of 22.5 and an actual production of more than 30 horsepower. The engine is a block type with large bearings and enclosed valves, designed for heavy duty. It is lubricated by a gear driven pump that forces lubricant to all the main bearings and by splash, and it is cooled by a thermo-syphon circulation of water through a square tube radiator suspended on springs, supplemented by a fan back of the radiator. The ignition is by a Bosch high-tension magneto and the carburetor is a standard float feed type. The clutch is a leather faced cone with springs under the facing to prevent harsh engagement.

The transmission gearset is a selective sliding gear type affording three forward speeds and reverse, and the shafts and gears are nickel steel. The gears have very wide faces. The jackshaft and gearset are assembled together and are suspended at three points, the jackshaft housing being carried in very heavy hangers. The drive is by chains from the sprockets on the jackshaft to those on the rear wheels. The frame is a reinforced nickel steel channel section 4.5 inches width and four inches depth. The springs are semi-elliptic forward and platform rear construction. The rear axle is three by two inches, a nickel steel forging, and it has very large spindles. The front axle is an I section of extra weight. The wheel bearings throughout are New Departure annular double ball type. The tiebar and the drag link are very heavy and are hardened and carefully fitted. The steering gear is a worm and nut design, that may be adjusted for all wear. There are two brakes, the service set being internal expanding and the emergency set external contracting on drums 14 inches diameter and 2.5 inches face on the rear wheels. Both brakes are equalized. The gearset and emergency brake levers are at the right side, the clutch and the service brake are actuated by pedals, and the spark and throttle levers are mounted on the steering column. The wheels are 36 inches forward and 40 inches rear, shod with 3.5 and four-inch solid tires respectively. The gasoline capacity is 18 gallons and the speed at maximum is 16 miles.

The Edison electric delivery wagon, built by the Edison Electric Vehicle Company of America at Lawrence, Mass., which was shown for the first time, has several novel features. It is worm driven, a Brown transmission being used, and with this design the drive is through the master leaves of the platform spring at the rear and a radius rod that is pivoted for a horizontal movement on the rear axle housing and pivoted for a vertical movement from a heavy frame member just at the rear of the forward motor bracket. The rear spring forward ends are fixed in hangers and the rear ends are shackled. Practically the same construction is used for the forward suspension, the forward ends of the side members being fixed in the spring horns and the rear ends being shackled to the cross member, which is mounted on a frame member. The Edison battery is carried in a shallow cradle. The machine has a capacity of 1000 pounds and large loading space.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

Burn-Boston Batteries.

A battery having all the conveniences of the dry cell and possessing additional advantages in that the electrolyte is a liquid, is the Burn-Boston, made by the Burn-Boston Battery & Manufacturing Works, 19 Doane street, Boston. It differs from the conventional dry cell in that it is not affected by moisture and does not deteriorate when out of service for a considerable period. Heat or cold has no effect upon the cells, which occupy relatively the same space as dry members. These are securely sealed, may be subjected to severe service and are not impaired by vibration. The connections are unusually durable and practical. The zinc terminal comprises a special wire equipped with a terminal, while the negative member is sturdy and eliminates connecting troubles. The voltage of the batteries is standard. The most prominent quality of the Burn-Boston battery is its long life. Instances are quoted by the company in support of this contention. A special trial offer is made and a booklet will be forwarded free on request.

Apco Ford Valve Grinder.

The work of grinding in the valves is made easier and accomplished more successfully when the proper tool is employed, one that fits the head of the valve. The Auto Parts Company, Providence, R. I., maker of Apco specialties, is marketing a special grinder for model T Ford automobiles which is not only inexpensive, but is decidedly practical. One of the several qualities of the tool is that it will fit under the dash and permit of grinding the valves in the No. 4 cylinder, which is difficult of access with ordinary grinders. The Apco is constructed of gray iron, highly polished and heavily nickel plated. It is very compact.

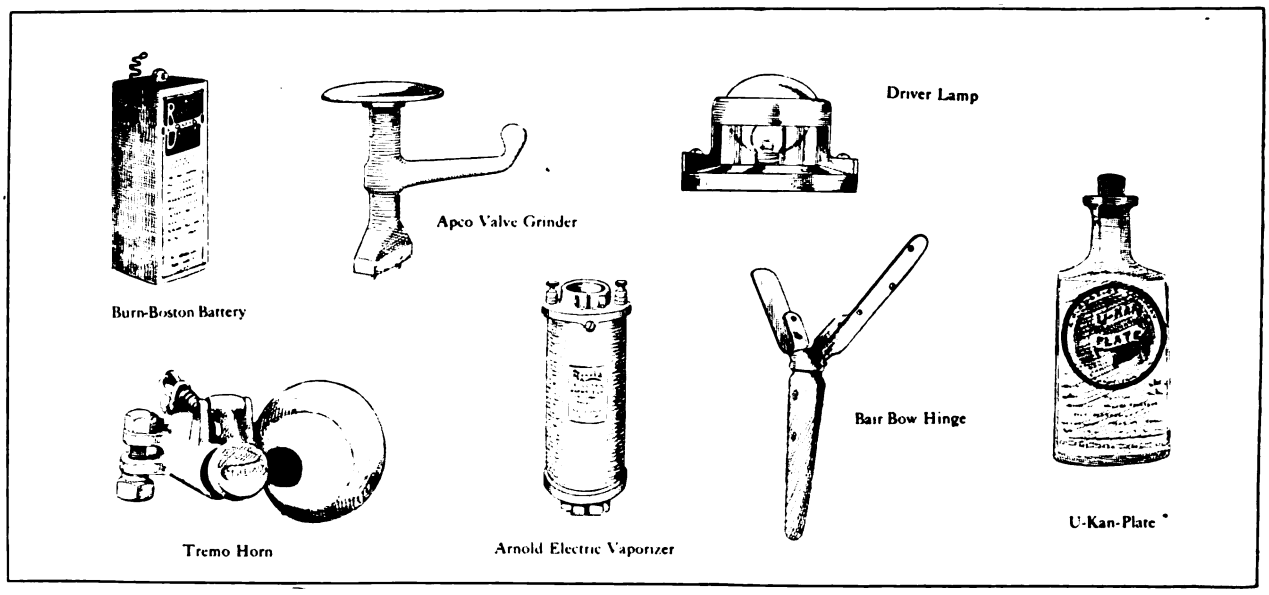
Tremo Horn.

A horn noticeable for its light weight and compactness is the Tremo, made by the D. Henry Bonner Company, Inc., Cambridge, Mass. It is made in four sizes, these being for varying horsepower, and that shown in the accompanying illustration is designed especially for model T Ford cars. The horn proper is a hollow sphere and is integral with the coupling that is slipped over the muffler pipe. The exhaust gases are diverted into the signal by a lid which normally is held away from the coupling member by a spring. The horn is actuated by a pedal and cable in the conventional manner and a quality of the signal is, in addition to its clear, musical tone, that back pressure and consequent noise are eliminated.

Driver Lamps.

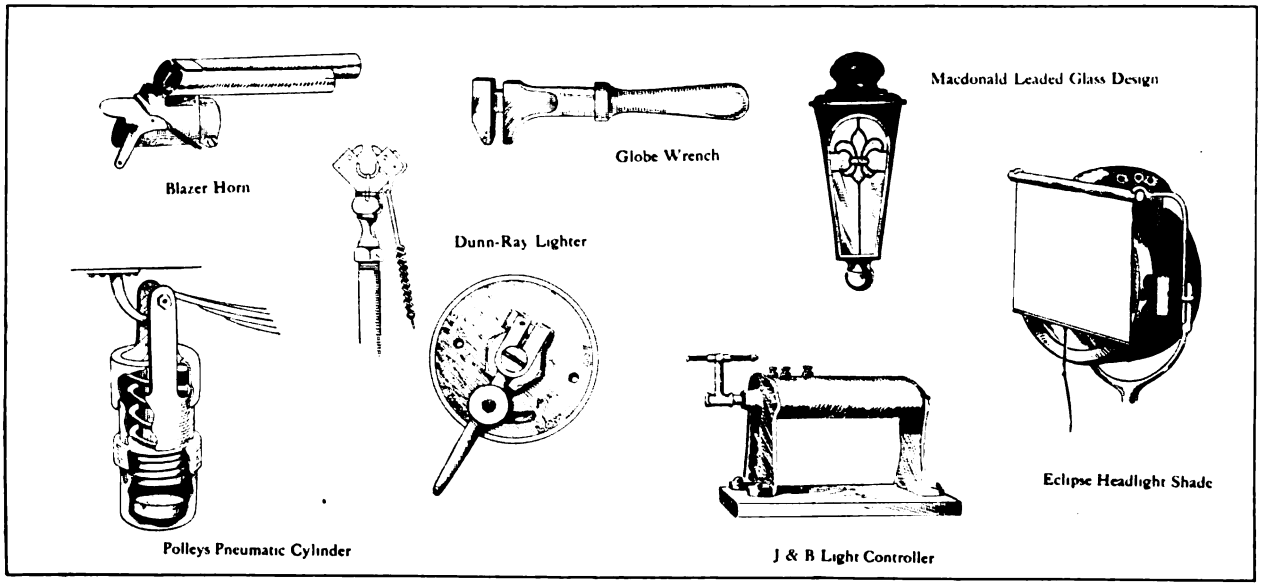
Driver lamps will appeal to those motorists who wish to utilize electric side and tail lamps in place of oil units. Although the lamps are very compact they are capable of projecting a beam of light a considerable distance and have been commended by the authorities in several states. The unit comprises a small rubber socket having a powerful lens and reflector, the entire construction being very sturdy. In addition the bulbs cannot be tampered with. The lamps are made in two styles, one for the side and the other for the tail or speedometer. The last named type is made to throw a white light on the license number, and each consumes but .2 ampere. It is stated that three lamps will give 150 continuous hours of service with an Edison battery. The equipment comes complete including three sockets, bulbs, screws, wire, one extra bulb, etc. A detachable key for a concealed switch is also included in the system. Lamps are provided for varying voltages, including three, six and eight. The Herbert S. Potter Company, 24 Commerce street, Boston, distributor for the Edison storage battery, markets the lamps.

Arnold Electric Vaporiser.



The Arnold electric vaporizer, manufactured by the Arnold Electric Company, 93 Massachusetts avenue, Boston, is designed to make easy the starting of the motor when cold and the principle involved is that of heating the air passing to the carburetor. The device is very compact and is placed over the hot air tube, being secured by clamps constructed integral therewith. Current is supplied from the conventional battery to two terminals and when the switch is closed it takes but a few seconds to heat the electric vaporizer which is supplied with heat until the motor is sufficiently warm. The Arnold vaporizer is easily attached and consumes but little current.

Bair Bow Hinge.



The Bair bow hinge is the product of the Auto Specialties Manufacturing Company, Chicago, and when driven into the four middle bow sockets of a four-bow top convert it into a six-bow member. Its function is to prevent sagging as the cloth is better supported and greater clearance is provided when the top is dropped. By means of set screws the height of each bow hinge may be regulated to obtain the desired shape. The Bair hinge is very compact, being but two inches when folded.

U-Kan-Plate.

The advantages of nickel or silver plated trimmings on the motor car are numerous. Not only do the lamps, etc., always present a good appearance, but it is a simple matter to keep the parts clean with a minimum outlay of labor. The A. R. Justice Company, Philadelphia, is marketing U-Kan-Plate, a liquid preparation, which when applied according to directions, silver plates parts the base of which is brass, copper, German silver or bronze. It is held not to contain mercury or acid, but pure silver, which is deposited by chemical action. It is applied easily with a cloth and requires but a short time

Digitized by Google

to thoroughly plate the article. Durable qualities are claimed for the preparation, which may be removed if desired by using any brass polish. U-Kan-Plate comes in varying size containers and is inexpensive.

Eclipse Headlight Shade.

The Eclipse headlight shade, as the name implies, is designed to instantly dim the lamps, eliminating the glaring effect which blinds pedestrians and other users of the public highways. The product of the Eclipse Headlight Shade Company of Syracuse, N. Y., complies with the laws of those cities which prohibit the use of headlights, and is a convenience in that in passing through cities the lights may be dimmed without leaving the seat. This is accomplished by a water proof shade held in a container mounted on the lamp brackets and operated by a pedal. When not in service there is nothing to detract from the appearance of the lamp. The shades are easily fitted, requiring no other tools than a screw driver and a wrench.

Blazer Horn.

The Blazer horn is marketed by the American Motor Equipment Company, 27 Haverhill street, Boston, and is designed for model T Ford automobiles. It is held to possess a soft, agreeable, yet penetrating tone, and is operated by the exhaust of the motor. It is attached over the outlet pipe of the muffler, extends toward the front of the chassis and it is claimed that it cannot clog. The exhaust gases are shunted to the signal by actuating a lid member which may be so operated as to produce a varying volume of sound. When not in service the horn does not in any way deflect the gases. It is easily fitted, requiring no special tools, and is operated by the usual pedal and cable. It is moderately priced.

Globe Wrench.

The Globe wrench, manufactured by the Globe Wrench Company, Ipswich, Mass., is termed a one-hand wrench in that it may be operated when held in one hand; that is, the jaws may be adjusted to fit the nut or bolt by rotating the handle. The mechanism is contained within the handle. The limit of adjustment is very fine and lost motion is eliminated by the principle involved. It is stated by the maker that after the adjustment is secured the wrench will break before it loosens its grip. The jaws are constructed of open hearth drop forged steel and a quality emphasized with the tool is that slipping is prevented.

Polleys Pneumatic Cylinders.

Polleys pneumatic cylinders are a patented principle of absorbing vibration by air, coil springs and rubber enclosed within a cylinder. They are shock absorbers and are adjustable to all types of motor vehicles and to both front and rear springs. The weight of the car is balanced on a coil spring and a valve in the piston head opens and closes automatically as the piston moves up and down in the cylinder, compressing the air, and conforming in pressure to the roughness of the road. The rubber cushion is utilized to care for the overload, and does not allow the coil spring to open or close beyond its elastic limit.

MacDonald Leaded Glass Designs.

Donald N. MacDonald, 400 Northampton street, Boston, attaches by a special process leaded glass designs to the motor car lamps and a variety of distinguishing marks are possible and in various colors. Monograms, crests, emblems, initials or devices are applied and it is held that the brilliancy of the lights is not affected. Standard or special designs are installed.

Dunn-Ray Lighter.

The Dunn-Ray lighter presents interesting features in that the flame at the acetylene burners may be controlled, in addition to being lighted or extinguished from the seat. This is made possible by a special dash controller, which is neat and compact and well constructed. By moving the lever to the right the blaze may be lowered to the minimum, a convenience when leaving the car for any length of time. The normal light is as easily secured by moving the lever to the left. The latter has a spring controlled pin which registers with recesses on the dial, making for efficiency of the system. The burners are made by the company and the acetylene is ignited by heating a platinum wire by current from a battery, but little being required. The flow of the gas is regulated and the tail light is included in the system, which can be installed easily as there is no complicated wiring. It is manufactured by the Dunn-Ray Company, 29 Central street, Boston.

J & B Light Controller.

The J & B light controller is designed to govern the current generated by the magneto on model T Ford cars when the electricity is utilized for lighting purposes. With this type of magneto the voltage developed is proportional to the speed of the motor and at high speeds the filaments are subjected to overload unless of proper size. On the other hand when the car is operating slowly, efficiency is not secured from bulbs designed to withstand high voltages. The J & B device is wired in parallel and one lamp may be utilized because each has an independent feed wire. It is installed directly forward of the carburetor, is adjustable, and is operated by a lever connected to the throttle lever of the vaporizer. As the carburetor is opened or closed the movement is imparted to the arm regulating the controller. In this manner the proper current is maintained at all motor speeds. The J & B controller is installed by drilling three .1875-inch holes in the metal shield between the motor base and frame. It is produced by the J & B Manufacturing Company, Pittsfield, Mass.

Digitized by Google

Stanwood Brush Insert.

More or less dirt accumulates in the car and as a result the clothing becomes soiled, to say nothing of the work involved in brushing the mats, etc. The Hayes Manufacturing Company, Detroit, is marketing the Stanwood brush insert, which is composed of specially prepared fibre brushes placed in series in pressed steel supporting devices. The insert is set into the running board so that the surfaces of the brushes are only slightly above its plane, providing a foot scraper of neat and finished appearance. The equipment comprises in addition to the brushes a T shaped frame, also a supporting L shaped member of steel, two steel clamping bars, nuts and spring washers. A template is given with each outfit, making it a simple matter to secure the proper sized opening for the insert, which may be placed in the running board as desired, depending upon the type of car, etc. Although the brushes are positioned securely, suitable spaces are provided to permit of displacing the dirt by washing and without removing the insert from the running board. The Stanwood brush insert is finished in brass or aluminum and is moderately priced.

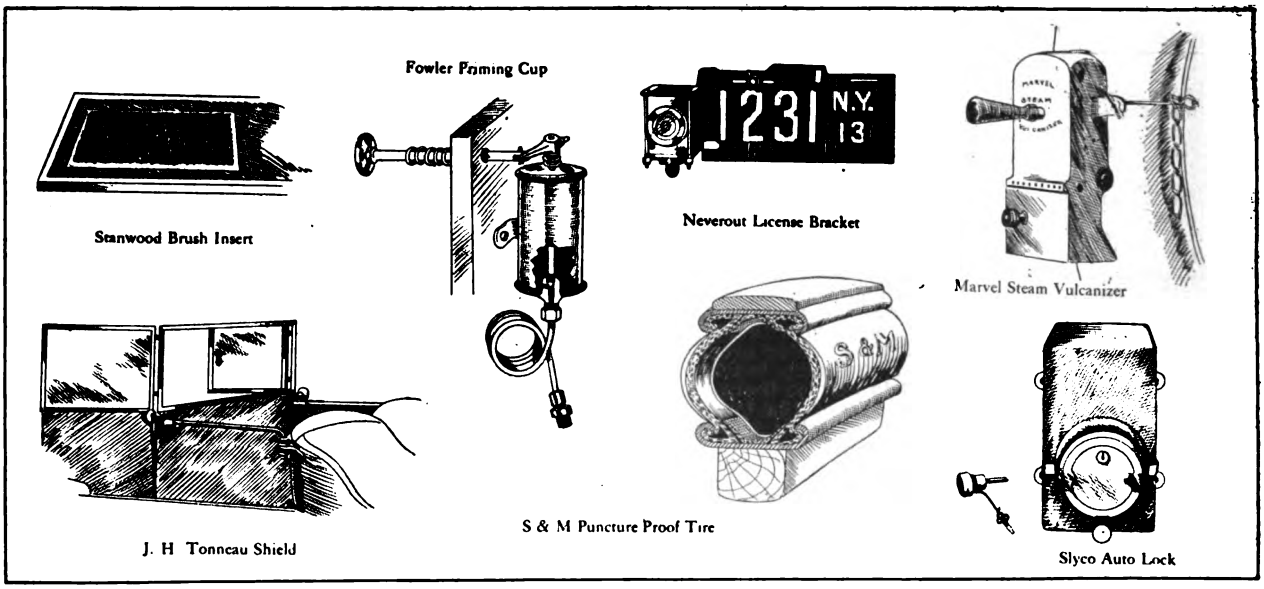
Fowler Priming Cup.

The Fowler priming cup, made by the Fowler Lamp & Manufacturing Company, Chicago, comprises a small container designed for mounting on the dash inside the hood and is utilized for priming the intake manifold. The fluid is led to the intake pipe by tubing and control of the gasoline, etc., is by a plunger lever or rod on the dash. The rod actuates a needle valve, allowing a predetermined amount of priming fluid to pass to the intake pipe. The device is self-closing and the priming cup is substantially made.

S. & M. Puncture Proof Tire.

A tire presenting an interesting feature in that the tread is a separate part is the S. & M. puncture proof shoe made by the S. & M. Manufacturing Company, Akron, O. It is pneumatic and employs the same size inner tubes as tires of the conventional type, but differs in that the side walls are in two parts and each is provided with two beads. The lower members retain the parts to the regular rim and the upper are employed for securing the tread. The latter is a metal clincher band having a rubber cushion tread cured to the metal. It is claimed that economy is effected in that the casing is saved from bruises and deterioration, etc.

Neverout License Bracket.



The Rose Manufacturing Company, Philadelphia, is marketing a new design of license bracket which is a combination unit in that it includes an electric tail light. The license holder is of the adjustable type and the number plate is held securely and without opportunity for vibrating or rattling. The tail light is substantially constructed, the frame being of reinforced metal. The design is not only neat and attractive, but is very compact.

Marvel Steam Vulcanizer.

The Marvel steam vulcanizer is produced by the Marvel Manufacturing Company, Cleveland, O., and the steam utilized for curing the rubber and cement is generated by the heat of an alcohol lamp which is integral with the device. It is held by the maker that the vulcanizer is entirely automatic in its action and that it will not burn or injure a tube or casing for which it is adapted. When used for repairing tubes it is clamped to the tube by means of threaded bolt members carrying wing nuts. When utilized on casings a chain is employed and it is not necessary to remove the tire from the rim. The vulcanizer comes complete with supplies.

J. H. Tonneau Shield.

The utilization of a windshield on the dash does not afford protection to the occupants of the tonneau who are exposed to the wind, dust and rain. A shield that presents interesting as well as practical features is the J. H. tonneau, manufactured by the J. H. Tonneau Shield Co., 225 West 49th street, New York City. It is designed for attachment by special fittings to the rear of the front seats and in addition to affording complete protection to the occupants of the rear seat is collapsible. It may be folded up back of the front seat, is adjustable to any desired position and has an extra advantage in that it may be employed as a table or a desk, making for convenience in touring. The main frame is fitted with .25-inch plate glass and side members with .0625-inch high grade celluloid. The side frames are adjustable by means of locking hinges and are provided with a special storm catch easy to operate. Another feature of the shield is the utilization of a water proof cloth curtain secured to the lower portion and reaching to the floor. This protects the passengers from rain and the construction is desirable in that it is not necessary to raise the top during showers. The frames are of mahogany, highly polished, brass and oxidized steel and the two side windows fold in when their use is not desired. The J. H. tonneau shield is adaptable to any type of car, is easily adjusted to any desired position and affords the protection of a top without the disadvantages of the latter.

Slyco Auto Lock.

Smalley Daniels, manufacturer's agent, Detroit, is marketing the Slyco auto lock, which may be attached easily to the usual spark coil and without changing its casing. It comprises a polished steel casing, heavily nickel plated, and is attached over the usual ignition switch by means of a screw driver. The cover is hinged and the device is open when the car is being operated, but locks automatically when closed. The key is attached to the plug, preventing its loss. As the retaining screws are inside the casing it will be noted that the lock cannot be tampered with.

DEALERS STILL BUSY WITH SHOWS.

Every Section Is Represented, from Maine to Oregon on the North and from Virginia to Utah and Colorado on the South---Bridgeport Holds Its Best Display.

BRIDGEPORT, Conn., is another of those cities, the proximity of which to the big national show in New York City was expected to effect in no large measure the success of the annual display of the local dealers' association. As was the case with Newark, Brooklyn and other cities near New York, the result of the annual Bridgeport exhibition in the Park City rink, March 3-8, was such as to indicate that the national display does not seriously interfere with sales. In every respect this year's show established a new record —in number of exhibitors, attendance and business transacted.

The event was under the management of Benjamin B. Steiber, who was successful in converting the interior of the building into a handsome setting for the cars and accessories, through the liberal use of pink and white, and green and white bunting. The list of exhibitors included practically all the dealers in Bridgeport and some from nearby cities and towns. Those who made display were:

Pleasure Cars—Lyford Bros., Oldsmobile, Oakland; Consolidated Motor Company, Abbott-Detroit; Bull's Head Garage, Franklin, Buick; Moon Sales Agency, Moon; Carl H. Page Company, Chalmers; Harry M. Ford, R-C-H; Elm Auto Company, Pope-Hartford, Mitchell, Studebaker, National, Waverley electric; Bulkley Auto Station, Paige, Lozier; George W. Weusterfeldt, Pierce-Arrow; Starbuck & Mattice, Ford; Peck & Lines, K-R-I-T, Paterson; Detroit Cadillac Company, Cadillac; Knowles & Tomlinson, Henderson.

Commercial Vehicles—Consolidated Motor Company, Selden; Elm Auto Company, White; Bulkley Auto Station, Gramm; W. M. Morris, G. M. C.; Peck & Lines, Knox Martin tractor; O. H. Banks, Little Giant, Mack, Saurer.

Motorcycles—C. W. Ellison, Pope; Waldorf Motor & Machine Company, Harley-Davidson.

Accessories—Metropolitan Auto & Garage Carriage Company, Post & Lester, J. L. Carpenter.

OREGON SEES NEW MODELS.

Majority of Dealers Meet with Success in Fourth Annual Portland Display.

Although a few of the dealers in Portland, Ore., were convinced that there was insufficient interest in a show to warrant holding the fourth annual event in the Land Show building, March 17-22, a majority easily won the day, and the people of Oregon responded in such numbers as to leave no room for doubt as to the success of the venture. It was argued that several sales were waiting for some such display in order to be closed, and this proved to be true. A large number of prospects also resulted.

The show was held under the direction of the following committee: Capt. W. H. Gray, Northwest Auto Company; Robert T. Atkinson, J. W. Leavitt Company; E. E. Gerlinger, Gerlinger Auto Company, and John M. Rieg. The actual management fell upon the shoulders of Mr. Rieg. Special sections were devoted to the exhibition of motorcycles and accessories and among the cars displayed were:

Pleasure Vehicles—American, Henderson, Stutz, Stoddard-Dayton, Reo, Overland, Pathfinder, Stearns-Knight, Hudson, McFarlan, Herreshoff, Rambler, Velie, Michigan, Haynes, Ford, Case, Mitchell, R-C-H, KisselKar, Beaver, Lozier.

Commercial Vehicles—Stearns, Velie, Reo, Menominee, Federal, Little Giant, Standard, KisselKar, Lippard-Stewart, Ford, Overland.

ST. LOUIS' SPRING DISPLAY.

Indoor Show Arranged as Supplement to Outdoor Exhibition Held Last Fall.

Although a large number of the dealers in St. Louis, Mo., took part in the outdoor show at Forest Park Highlands last fall, several others were represented at the eighth annual display in the Coliseum under the management of Frank Bishop. The interior of the building presented a spring scene, a liberal use of smilax, mountain laurel and other flowers providing the necessary transformation. The list of exhibitors follows:

Pleasure Cars—T. J. Moss Motor Car Company, Staver, Borland electric; Meyer-Busch Motor Car Company, Speedwell; Beustadt Auto & Supply Company, Marion; Lindell Auto Sales Agency, Cutting; Detroit Electric Car Company, Detroit electric; M. & T. Motor Car Company, M. T.; Geo. C. Brinkman Motor Car Company, National; De Luxe Automobile Company, Warren, Argo electric; Todd Auto & Rental Company, Marathon; Cochrane Motor Sales Company, Cartercar; Imperial Motor Company, Imperial; Wiemeyer Motor Company, Ames; Paine Automobile Company, Haynes, Crow Elk-Hart; American Welding & Auto Repair Company, Midland; Coller-Reitz Motor Car Company, McFarlan; Pullman Motor Car Company, Pullman.

MANY SALES IN SYRACUSE.

Success Attained by Automobile Dealers' Association Exceeds All Expectations.

While the Syracuse Automobile Dealers' Association expected that this year's fifth annual show in the local armory at Syracuse, N. Y., would prove the best ever held, the members were not prepared to expect the large attendance or the increased business which resulted. Over 5000 people were present on the opening night and this ratio was maintained until the close of the show. Several sales were recorded the first evening, and the number was increased steadily throughout the week.

Henry T. Gardner, Manager, Syracuse Automobile Show.

A large share of the credit must be given to Henry T. Gardner, who had charge of the details. The decorations proved a revelation. Outside the building, over the doorway, a large automobile was outlined in electric lights, and the effect was that of a moving car when the bulbs were turned on at night. The interior was transformed into an Italian garden, over which was suspended a canopy of gold and magenta bunting. A partial list of the cars exhibited follows:

Pleasure Cars—American, Cole, Stevens-Duryea, Alco, Ford, Moyer, Franklin, Case, Oakland, Reo, National, Auburn, Pathfinder, Overland, Cadillac, Detroiter, Buick, Hudson, Haynes, Firestone-Columbus, Studebaker, Cartercar, Knox, Chalmers, Garford, Rauch & Lang electric, Metz, Rambler, Packard, K-R-I-T, Winton, Pierce-Arrow, Locomobile, Regal, Lozier, Velie, Pope-Hartford, White, Baker electric, Standard electric, Moline, Michigan, Abbott-Detroit.

Commercial Cars—Federal, International, White, Mais, Knox, Garford, Palmer-Moore, Menominee, Chase, Packard, Sanford, Alco, Pierce-Arrow, Pope-Hartford.

Motorcycles—Eagle, Excelsior, Dayton, Harley-Davidson, Henderson, Indian, Thor.

EASTERN MAINE DISPLAY.

Many Towns in That District Contribute Toward the Success of Bangor Show.

The success of the Eastern Maine automobile show in the Auditorium at Bangor, Me., was aided largely by the railroads centring in that city, all of which offered special rates during the progress of the exhibition. Delegations numbering as many as 180 in some instances were present from Belfast, Bucksport, Ellsworth, Bar Harbor, Cherryfield, Waukeag, Hancock, Columbia, Newport, Waterville, Houlton, Fort Fairfield, Eastport, Old Town, Orono and other cities and towns from all sections of eastern Maine.

Sales were recorded during the opening hours and these were by no means confined to cars. One concern reported the sale of over $5000 worth of Walpole tires during the week. The list of exhibitors included the following:

F. A. Nickerson, Pierce-Arrow, National, Chalmers, Severance & Craig, Metz, Maxwell; Maine Motor Car Company, Peerless; Bath Garage Company, Cutting; Harmon Automobile Company, Hudson; S. L. Crosby, Oakland; Miles B. Mank, Knox, Cole; Charles B. Treat, Mitchell; E. A. Marsters, International truck.

NORFOLK'S SECOND ANNUAL.

Virginia People Inspect New Models and Talk Over Good Roads Problems.

The second annual show of the Norfolk Automobile Dealers' Association was held in the local armory, Norfolk, Va., March 17-22. The success of last year's display was repeated, both in the matter of attendance and in the number of sales consummated. In addition, the Tidewater Automobile Association found abundant opportunity to interest the people of Virginia in the subject of good roads.

The show opened with a monster street parade, in which many of the owners in Norfolk and surrounding territory took part. On account of the date, St. Patrick's Day, green was the prevailing color, and this was carried out to good effect in the decorative scheme within the hall. Those who made display included:

C. L. Young, Allen Motor Company, Arthur Depue, Virginia Auto & Garage Company, P. L. Harrison, Chalmers Motor Car Company, Bell Motor Company, Michigan Motor Branch of Virginia, Tidewater Automobile & Garage Company, Coburn Motor Car Company, Case Automobile Agency, International Harvester Company, Frank X

Digitized by Google

Parker, Mitchell Automobile Agency, W. Daughtridge, Reliance Electric Company, Ball & Co.

The following makes of cars were represented:

Pierce-Arrow, Cole, Kline-Kar, Buick, Locomobile, Haynes, Lozier, Rambler, American, National, Marion, Overland, Ford, Chalmers, Michigan, Baker electric, Waverley electric, Studebaker, Mitchell, K-R-I-T, Marathon, Case, Packard, International truck, Indian motorcycles.

INTERMOUNTAIN AUTOMOBILE SHOW.

Display in Salt Lake City Booms Good Roads and Sells Cars in Five States.

Three years ago the automobile dealers in Salt Lake City, Utah, held their first show. Last year there was a small representation of cars in a similar exhibition. The third display was held in the Auditorium, March 3-8, and was of decided importance to the industry in every way. The committee in charge, consisting of L. J. Gilmer, J. R. Hall and N. H. Bertram, sought and obtained the assistance of the dealers in Idaho, Wyoming, Nevada and western Colorado, as well as those in Utah outside of Salt Lake City. The event was termed an Intermountain automobile show and was under the direct management of W. D. Rishel.

In addition to the large number of cars on display, for which it was evident from the opening of the show there was to be a satisfactory list of purchasers and prospects, the local council of the Midland Trail Association took advantage of the opportunity afforded to advance the interests of good roads. The interior of the building was handsomely decorated, and in every respect the week was one which will long be remembered by the motorists and prospective motorists in that district. The list of exhibitors follows:

Pleasure Cars—Utah Motor Car Company, Packard, Campbell Auto Company, Premier, Michigan, Overland; Wright Motor Car Company, Pathfinder; J. I. Case Threshing Machine Company, Case; Velie Motor Vehicle Company of Utah, Velie; Speedwell Agency Company, Speedwell; Studebaker Bros. Company of Utah, Studebaker; White Automobile Company, White; A. O. Whitmore, Baker electric; Sherman Auto Company, Cadillac; Alkire Smith Auto Company, Ford; Salt Lake Auto Company, Franklin, Detroit electric; Monarch Motor Company, Stearns-Knight; Cartercar Utah Company, Cartercar; Cheesman Auto Company, Locomobile, Chalmers, Paige; Randall-Dodd Auto Car Company, Buick, National; Tom Botterill Auto Company, Pierce-Arrow, Hudson.

Commercial Vehicles—Utah Motor Car Company, Packard; Velie Motor Vehicle Company of Utah, Velie; Speedwell Agency Company, Speedwell, Wagenthal; White Automobile Company, White; Salt Lake Auto Company, Alco, International; Cheesman Auto Company, Standard, Federal, Menominee.

Motorcycles—Lon Claflin, Indian; Bicycle Supply Company, Excelsior; Western Arms & Sporting Goods Company, Pope; J. Louis Anderson, Harley-Davidson, Thor.

Accessories—Tom Botterill Auto Company, Bertram Motor Supply Company, Austin Tire & Rubber Company, Utah Oil & Refining Company, Monarch Motor Company, Salt Lake Hardware Company, Continental Oil Company.

BUSINESS IN CEDAR RAPIDS.

Dealers in Iowa City Enjoy Good Week During Fourth Annual Exhibition.

The fourth annual show of the Cedar Rapids Automobile Dealers' Association was held in the Auditorium, Cedar Rapids, Ia., March 10-15. The success of previous exhibitions had been such that every inch of available space was taken long before the display opened. Another large attendance was experienced this year and the business transacted was in proportion to expectations. The list of exhibitors included the following:

Automobiles—H. I. Bunting, Oakland; W. F. Schrieber, Detroiter; Beck & Sons, trucks; Cedar Rapids Auto & Supply Company, Chalmers, Lozier, Michigan, White, Reo; J. A. Wicke, Moline; Barton Motor Car Company, Cole, Hudson, Velie, Baker electric; Courtney Motor Car Company, Ford, Studebaker, Rambler; Iowa Auto & Tire Company, Cadillac; C. E. Fawcett, Garford; Windsor Hotel Garage, Paige; J. E. Elgin, Enger, Empire, Metz, Pilot; S. G. Gay Company, trucks; Matheson Sales Company, Matheson; Capital City Carriage Company, Richmond; S. M. McQuestion, Davis; Foy Supply Company, Overland.

Motorcycles—E. H. Hall, Harley-Davidson; Rob Smulekoff, Excelsior, Henderson, Black Hawk; G. A. Sayers, Indian.

Accessories—W. H. Burrows, general line; Cedar Rapids Oil Company, lubricants; D. P. McClure, general line; Tokheim Manufacturing Company, pumps; Western Auto Supply Company, supplies; Vac Liquid Equipment Company, pumps; Iowa Light & Power Company, electrical supplies; Universal Portland Cement Company, road building materials.

MANY OUTSIDE DEALERS.

Majority of Those Represented at Waterville, Me., Came from Other Cities.

Waterville, Me., enjoyed its first automobile show in the Empire rink March 4-7. Of the 15 exhibitors eight were from other cities in Maine and Boston. The walls were covered with green bunting, the national colors being used with good effect to relieve this single tone, while the exhibition spaces were marked off by lattice work entwined with Virginia smilax. The attendance throughout the week was decidedly satisfactory and considerable business was reported. The exhibitors were:

W. J. Skehan, Augusta, Buick, Chalmers, Stevens-Duryea; Wade & Dunton Motor Car Company, Lewiston, Cadillac; Waterville Motor Company, Waterville, Studebaker, Reo; Guy Lawrence, Gardiner, Lozier; Steward & Marston, Waterville, International truck; Portland Company, Portland, Knox, Cole; Joseph Sawyer, Fairfield, Oakland; Darling Auto Company, Auburn, Reo truck; Wallace Spencer, Waterville, Mitchell; Morrison Auto Company, Waterville, Ford, Michigan; E. L. Gove Company, Waterville, Overland; H. N. Beach, Waterville, Yale motorcycle; E. S. Baker, Waterville, Indian motorcycle; Herbert & Towle, Lewiston, tires; Wayne Oil Tank & Pump Company, Boston, storage systems.

LOUISVILLE CLUB CELEBRATES.

Tenth Anniversary Followed Closely by Sixth Annual Show—The Best Yet Held.

Feb. 27 the Louisville Automobile Club, Louisville, Ky., held a banquet to commemorate the 10th anniversary of its organization. March 5 its sixth annual show was opened in the armory for one week. Both events were the best attended since the formation of the club, and the latter was marked by the largest number of retail sales yet received by the Louisville dealers at a local show. Now the officials of the club are planning a triple celebration for April 10, at which plans will be laid for the 1913 season and the 1914 display.

The interior of the building was completely transformed, the exhibition spaces being marked with artificial stone walls, surmounted by iron pickets. Surrounding the walls and fences were sprays of green oak, and green and white bunting was used to good effect on the sidewalls and ceiling. Thousands of electric lights helped to carry out the entire scheme. The list of exhibitors follows:

Coliseum at Des Moines, Ia., Where Recent Automobile Show Was Held.

Leyman Motor Car Company, Prince Wells, Kentucky Motor Car Company, Glossbrenner Commercial Car Company, Clark Motor Car Company, Kentucky Auto Company, Hite D. Bowman, Reimers Motor Car Company, J. L. Case Company, Thomas Garage, A. E. Reid, Rommel Motor Car Company, Louisville Lozier Company, Kentucky Wagon Works, Standard Auto Company, Southern Motors Company, Yager Motor Car Company, Inter-State Motor Sales Company, Hiter-Logan American Sales Company, Transit Motor Car Company, J. J. Caffrey.

Among the cars displayed were the following:

Cadillac, McFarlan, Rambler, Waverley electric, Locomobile, Ohio electric, Little, Chevrolet, Chicago electric, Ford, Inter-State, Detroiter, Case, Lozier, Paige, American, Winton, R-C-H, Buick, Stearns-Knight, Peerless, Hupmobile, Rauch & Lang electric, Columbus electric, Overland, Chalmers, Urban electric truck.

NEW RECORDS IN DES MOINES.

Fourth Annual Display Finds Local Dealers Prepared for Big Business Results.

The fourth annual show of the Des Moines Automobile Dealers' Association in the Coliseum, Des Moines, Ia., March 3-10, was the largest in number of exhibitors, in attendance and in amount of business transacted that has yet been held by that organization. The visitors were by no means confined to Des Moines, the people of Iowa apparently feeling that the event was of state wide importance.

The decorative scheme was intended to convey the impression of a Dutch village. An abundance of foilage, vine covered walls, pretty streets, hanging baskets of flowers and electric lights combined to produce an outdoor effect that was decidedly pleasing. In each of the four corners of the hall was installed a Dutch windmill, the big wheels of which revolved continuously. A large blue canopy studded with electric lights, representing stars, still further accentuated the scene.

Some 60 different makes of cars were displayed, and as each dealer showed from one to four models, the grand total was close to 200 machines. In addition there was a decidedly representative exhibit of accessories, parts, fittings and supplies.

DENVER'S SOUTHWESTERN DISPLAY.

Chamber of Commerce Aids Local Dealers in Making Twelfth Annual Show a Success.

The 12th annual Denver automobile show was held in the Municipal Auditorium, Denver, Col., March 4-8, under the management of G. A. Wahlgren. The local dealers took advantage of this opportunity to display the new models for the inspection of a large number of people residing in the Southwest. In addiiton, the Denver Chamber of Commerce, through its "Build Colorado First" committee, brought the benefits of good roads to the attention of the visitors in a thoroughly practical manner.

Previous to the opening of the show a good

Digitized by Google

roads banquet was held at the Albany hotel, Gov. Ammons being the guest of honor. Many prominent people were present, not only from Colorado, but from other states in the Southwest. The enthusiasm thus created served to establish the value of motoring, and proved of invaluable assistance to the dealers in closing sales during the show. The list of exhibitors included the following:

Pleasure Cars—Mathewson Auto Company, Lozier, Reo, Ohio electric; Overland Auto Company, Overland, Apperson, KisselKar; Stanley Motor Carriage Company, Stanley steam; Western Motor Car Company, Abbott-Detroit, Paige; Wilson Motor Company, Mitchell; J. I. Case Threshing Machine Company, Case; J. L. Armstrong, Baker electric; William Thornley Auto Company, Little; Havens Motor Car Company, Dorris; Inter-State Motor Car Company, Inter-State; Estarado Auto Company, Hupmobile; Hall Auto Company, Stutz, Marion; Michigan Motor Car Company, Michigan, Oldsmobile, Waverley electric; Fritchle Automobile Company, Fritchle electric; Colorado Cartercar Company, Cartercar; Mercury Manufacturing Company, Ford; R-C-H Corporation, R-C-H; M. & M. Auto Company, Pathfinder; Wallace Motor Car Company, Locomobile; White Company, White.

Commercial Vehicles—Capitol Truck Company, Capitol; Inter-State Motor Car Company, Wichita; Continental Motor Truck Company, Continental; Mercury Manufacturing Company, Mercury; Overland Auto Company, KisselKar; Wilson Motor Company, Selden; Auto Tractor Company, Zimmerman tractor; Shaffer Auto Supply Company, Blair.

Motorcycles—Mead Auto Cycle Company, Excelsior; W. W. Whiting, Harley-Davidson; Hendee Manufacturing Company, Indian.

Accessories—K. & W. Reliner Company, Better-Than-Air Tire Filler Company, Shaffer Auto Company, Easy Cleaner Company, Hendrie & Bolthoff, Auto Equipment Company, Metal Welding Company, Cook's Dry Battery Company, Fry & McGill Motor Supply Company, Clason Map Company, Mine & Smelter Supply Company, Denver Auto Goods Company, Boss Rubber Company.

UTICA SEES NEW DESIGNS.

Local Dealers Assisted by Syracuse Agents in Presenting Successful Display.

Immediately following the close of the show in Syracuse, N. Y., some of the exhibitors at that display moved on to Utica, N. Y., for the exhibition of the Utica Automobile Dealers' Association. The event was held in the local armory, March 10-15.

Gold and white were chosen for the foundation of the decorative scheme, and this combination was decidedly prominent in the overhead treatment. Ornamental pedestals, surmounted by cut flowers marked the exhibition spaces. The attendance throughout the week was decidedly satisfactory and much business resulted. The list of exhibitors follows:

Automobiles—Genesee Garage Company, Overland; Crim-Bronner Company, Studebaker, Cole, Stewart truck; Buick Motor Sales Company, Buick; Terry Garage Company, Schacht; John M. Weaver, Stutz, National; Metz Motor Sales Company, Metz; Robert Payne, Velie; Haynes Company, Haynes; Franklin Motor Car Company, Franklin; Chas. H. Childs Company, Jackson, Coleman truck; H. A. Moyer, Moyer; George Hammer, Imperial; Victor Vernon, American; J. I. Case Threshing Machine Company, Case; International Harvester Company, International truck.

Miscellaneous—Bowen Bros., motorcycles; Oneida Garage Company, oils; Hover Company, vacuum cleaners; Indian Refining Company, lubricants; Standard Oil Company, oils; Cadby Company, cameras; M. E. Hooks, electrical devices.

BIG RESULTS AT PEORIA.

Annual Display in Illinois City the Most Successful Yet Held by Dealers.

With every inch of floor space taken weeks in advance of the opening night the dealers in Peoria, Ill., held the most successful show of its career in the Coliseum, March 12-15. The event was under the management of Albert H. Whigham, who worked out a decorative scheme that set off the various exhibits in the most advantageous manner. Reports from the dealers indicate that in attendance and number of sales all previous records were exceeded. The list of exhibitors follows:

Cars—Peoria Auto Company, Franklin, Regal; Bartholomew Company, Glide; C. W. Robinson, Cole, Waverley electric; Warren Motor Sales Company, Warren; Reliance Auto Company, Hupmobile; Cadillac Auto Company, Cadillac; L. J. Robinson, Buick; Machemer & Pinkerton, Chalmers, Ford; Avery Company, Avery truck; F. H. Avery, Detroit electric; W. H. Colean, Broc electric; Kircher & Wood, Ohio; J. I. Case Company, Case; Rambler Auto Sales Company, Rambler; Westcott Garage, Metz, Westcott; Cummings & Rutherford, Overland; L. R. Caldwell, Michigan; M. M. Baker, Packard; E. G. Isch, Inter-State; Collins & Archdale, Moon; C. L. Turner, Velie; B. F. Adams & Co., Studebaker; Clark & Cashin, Hudson, Peerless.

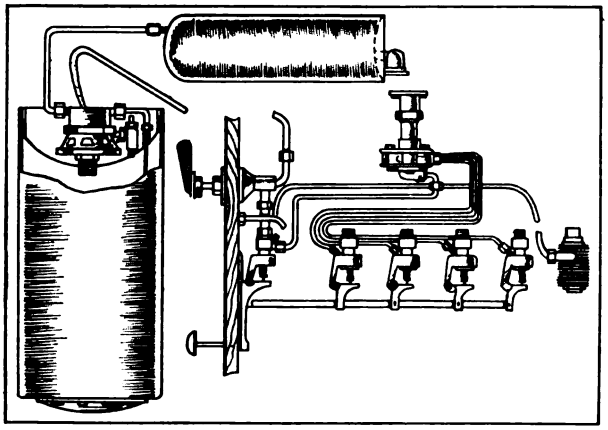
Miscellaneous—Peoria School of Motoring, Fitch Auto Supply Company, Graham-Seltzer Company, Bartell-Sweeney Company, National Refining Company, Indian Refining Company.

BUFFALO'S TRUCK EXHIBIT.

Local Dealers Hold Special Event for Business Men of That City and Vicinity.

While the annual pleasure car show of the Buffalo Automobile Dealers' Association was held in Buffalo, N. Y., last December, the agents for commercial vehicles decided to wait until March 11-15 before bringing the merits of the mechanical transports to the attention of the local business men.

The event was a decided success. Full opportunity was given for demonstration and the educational value of the display hardly can be overestimated. The hall was treated in red and white, although no special endeavor was made to present an elaborate decorative scheme.



Digitized by Google

MECHANICAL NOTES FOR OWNERS.

Features of H & M Motor Starter Utilizing Carbon Dioxide---Reducing Lost Motion in Steering Gear and Linkage---Spark Plug Having Adjustable Gap.

A motor starter operating on the pressure principle, in which the crankshaft of the internal combustion engine is rotated through application of carbon dioxide to the piston, is the H & M automatic pressure starter, produced by the Ham-Meix Manufacturing Company, Indianapolis, Ind. The carbon dioxide is chemically produced, being controlled and maintained by the use of a liquid tank, generating or storage container and an automatic diaphragm valve. It is held by the maker that carbon dioxide is non-explosive, will not injure metals or rubber and that it may be employed for inflating tires.

The larger tank is carried at the rear of the machine, is tested to withstand a pressure of 500 pounds and is equipped with a diaphragm valve

H & M Automatic Pressure Motor Starter Employing Carbon Dioxide Chemically Produced.

so constructed that it may be adjusted to control any pressure from five pounds to the maximum. The liquid tank is smaller and is equipped with a filler cap for replenishing the charge when necessary, but it is stated that one filling will suffice for 60 days. Extra recharges are put up in convenient packages and are not expensive.

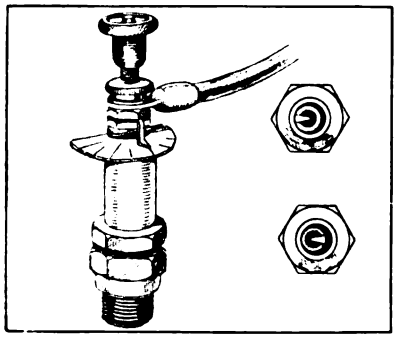
A pipe is led from the storage tank to a dash shut-off valve having a detachable key for locking purposes, thence to a diaphragm valve. The gas flows through another tube to a distributor which may be a four or six-cylinder unit, and which is driven at camshaft speed. The discs and ports of the device are so arranged that pressure is admitted in the proper firing order of the motor.

After leaving the distributor the gas passes to a diaphragm motor valve on top of each cylinder, thence to the combustion chamber, forcing the piston downward. The construction is such that compression is relieved, enabling the motor to be spun easily with a very low pressure. The motor valves are operated by a push button on the dash actuating which also permits of the passage of gas from the storage tank to the distributor.

The system is applicable to any type of gasoline car and is made in several sizes to meet requirements of installation. All valves are adjusted and assembled before leaving the factory and are held to be non-leakable.

VARIABLE GAP SPARK PLUG.

It is a well known fact that the width of the gap, or space between the points of a spark plug, is an important factor in ignition. Makers of plugs advise a predetermined gap, that utilized with a magneto being less than when the source of current is a battery. There are times, however, with the latter system, when the spark will be weak through run-down batteries, and starting is made difficult. The usual remedy is to decrease the gap, an operation involving the removal of the plugs and subsequent readjustment of the points.



An adjustable spark plug has been brought out by an English concern which presents interesting features in that the width of the gap may be varied when desired and with the motor operating. The device is presented in an accompanying illustration and it will be noted that the gap from the central electrode to the body or shell is adjustable by means of a milled edge cap of non-conducting material, attached to the outer end of the electrode.

The latter is made slightly eccentric in relation to the body of the plug, so that when it is rotated the gap is varied. The extreme positions are illustrated in the sketch, the upper denoting the minimum and the lower the maximum. The gap, however, is exaggerated in the drawing to depict the positions. Stops are provided to prevent moving of the electrode other than when desired, by a projecting tongue of insulated material, a form of steatite. Accuracy in adjustment

Digitized by Google

is made possible by a calibrated scale and a pointer.

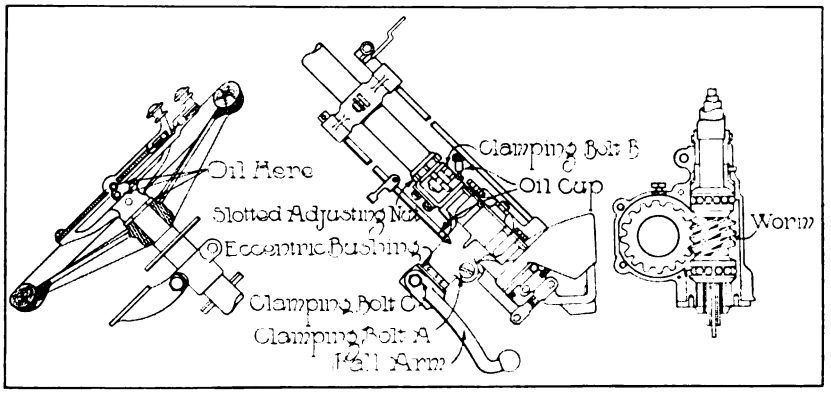
Among the advantages of the device is that it would be possible to start upon the magneto, when the latter developes a weak spark, by decreasing the gap, and to remove soot or deposits by changing the gap much in the same manner as the spark gap method employed in this country.

Adjustable Spark Plug.

ADJUSTING THE STEERING GEAR.

As the steering gear and linkage is subjected to considerable service, wear follows and the components of the system require attention. Few motorists realize the amount of work this mechanism performs, because steering a machine becomes purely automatic with the driver, as is indicated by the involuntary movement of the operator when the car starts to skid. Each time the wheel is moved, even slightly, several parts are brought into action and in travelling 50 miles, for example, the movements may number thousands. If one were to make note of the times the wheel was moved the result would be surprising.

Inasmuch as the steering mechanism is called upon in this manner, the material and construction are as nearly perfect as possible, but it is evident that in time certain components will wear even if properly lubricated. More lost motion, however, is due to neglect rather than to wear, and the manufacturers are conducting an educational campaign by incorporating in their instruction books, complete directions as to the care of the components of the steering gear.



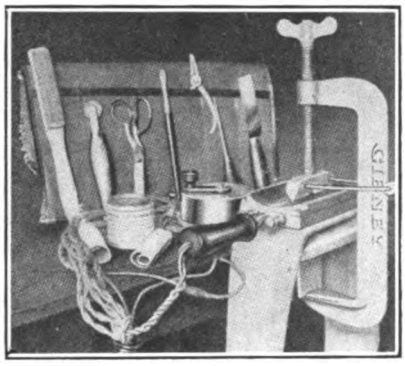
An instance is noted in the book issued by the Willys-Overland Company, Toledo, O., maker of the Overland cars. Sectional views of the wheel, column, worm and gear are included and these have been redrawn and lettered to make clear the parts requiring attention, as well as those components which are utilized in making adjustments.

Play or lost motion is noted easily by rotating the wheel when the car is standing still. There should be a little play, very little, it being necessary for operation. If an excess exists it may be removed by adjustment. First jack up the front wheels so that the gear may be tested during the work. It will be noted that there are two clamping bolts marked A and B. These are loosened, after which the slotted adjusting nut is turned to the right until the play is reduced. This may be ascertained by trying the wheel.

Next rotate the wheel until further movement is impossible and adjust the worm gear by turning the eccentric bushing C. Make this adjustment with the wheel turned to the extreme right and left, as a majority of the wear occurs in the centre since the car travels mostly in approximately a straight line.

If adjustment fails to correct the lost motion it will be necessary to remove the ball arm which may be accomplished by displacing the clamping bolt C. Next turn the steering wheel one and a half times, which will present a new surface, there being four, as will be noted in the drawing. Make the adjustment as previously outlined and after replacing the arm member make sure that all parts are locked. The compartment containing the worm and gear should be packed with fresh grease and lubricant introduced through the oil cups.

In attempting to reduce lost motion, play in the linkage should not be mistaken for wear of the worm and gear. The linkage is tested easily by jacking up the wheels and moving them. In performing this work care must be taken not to confound play in wheel bearings and spindles with lost motion in the linkage.



Showing Components of Steering Mechanism Requiring Attention and Means Incorporated for Eliminating Lost Motion.

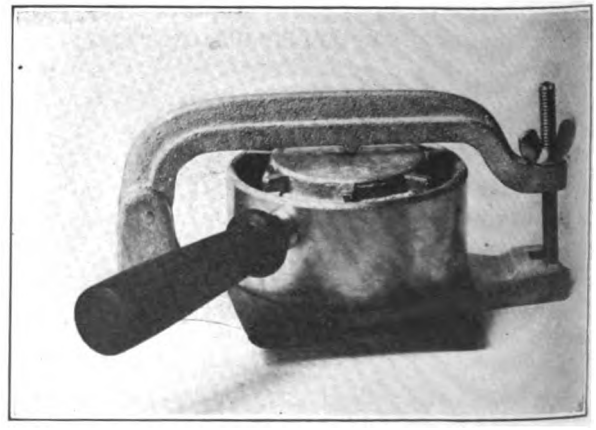
Digitized by Google

EQUIPPING THE PRIVATE GARAGE.

Part V.

In the last installment was included a list of supplies needed in the overhaul of the car and although nearly 30 articles were named a large number of these may be dispensed with if the owner is to attend only to minor repairs. With the exception of the soldering iron, oil and grease gun, the cost of the listed supplies would not exceed $2 at the most and by purchasing a few at a time the garage could be stocked easily.

Gibney Eleck-Trick Vulcanizer.



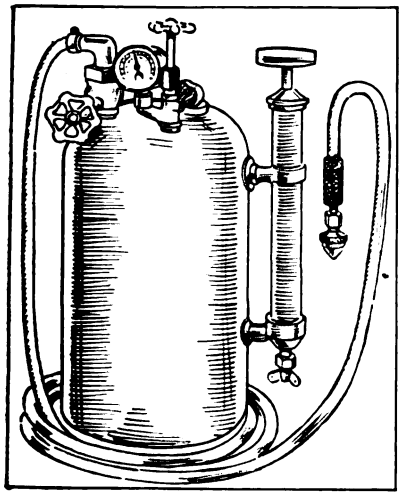
Dixon's graphite comes in various sized packages and is not expensive. It will serve for a number of useful purposes and is indispensable in the overhaul of the chassis. The use of material will be considered in the overhaul, which will be included in this series. Cotter pins, lock washers, taper pins, hexagonal nuts and cap screws are always needed and come in assorted sizes. A good quality of shellac should be purchased and stored in a bottle having a wide mouth to which should be fitted a tight stopper. The shellac should not be left exposed to the air as it dries quickly. A small tube of Prussian blue is inexpensive and will be useful when bearings are to be scraped in.

Valve Grinding Compound.

Regarding an abrasive for grinding in valves, there are several excellent preparations on the market, but a substitute can be secured in the finest grade of carborundum which when mixed with oil makes a fine valve grinding compound. A bundle of waste is not absolutely necessary. It is preferable to old rags, but the latter will serve. In selecting the hand soap care should be exercised not to purchase any material that will roughen the skin. Copper, brass and iron wire can be picked up for a few cents. In purchasing gasket material the owner will find a wide variety from which to choose, including asbestos, fibre, mobiline, combinations of these and special materials. These will be dealt with in the overhaul of the power plant.

The most inexpensive form of cleaner is a can filled with gasoline and a brush. More or less fuel, however, is wasted and as many places are difficult to reach with the brush the writer favors a motor washer. These may be made or purchased. In an accompanying illustration is depicted the Turner device, made by the Turner Brass Works, Sycamore, Ill., a washer actuated by pressure. It is made in three sizes, holding one quart, two and five gallons respectively. The tanks are constructed of drawn steel, have a pressure gauge, a suitable length of flexible hose and an adjustable nozzle. The last named may be so set that a finely divided or intense needle stream can be secured. Kerosene is utilized and being subjected to considerable pressure the fluid removes easily all dirt and grease from parts not accessible to the brush. An advantage of the washer is that the tank may be pumped full of dry air and employed for cleaning upholstery, etc.

One may be made by taking a stout one-gallon can, cutting a small hole in the top and soldering in a complete tire valve. Next fit and solder a petcock to the container and slip over this a suitable length of rubber hose, taking care to wire the tube to the petcock. A nozzle may be made of a small, round piece of brass, boring a needle like opening. This should be made very small, and after being inserted in the tube the latter should be wound snugly with wire to prevent leaks. The filler cap should be fitted with a rubber washer



The Shaler Vul-Kit, a Moderately Priced Automatic Vulcanizer Employing Gasoline.

and after the can has been filled about half full of kerosene, screwed down snugly. Pressure is secured by attaching a pump to the valve and a few

Digitized by Google

strokes will develop sufficient compression. When pumping the petcock must be kept closed, being opened only when the washer is in service. A little experimentation with the nozzle will determine the most efficient opening.

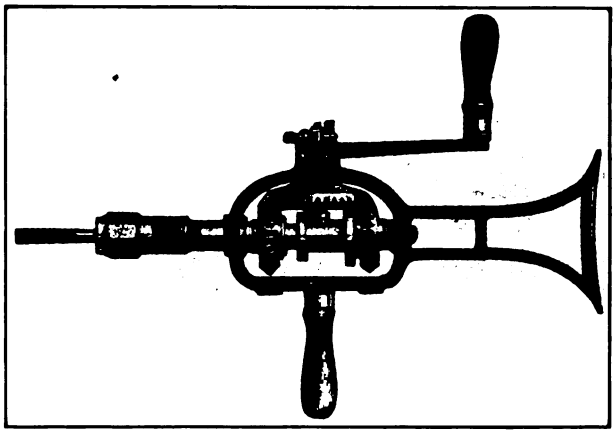
Turner Motor Washer.

The purchase of a valve grinding tool is optional with the motorist. The work can be accomplished with an ordinary screw driver or by using a bit-stock. The service of a tool designed especially for the work will prevent the novice making errors and in an accompanying illustration is presented the Ashcroft combination valve grinder marketed by Stevens & Co., New York City.

When the efficiency of the portable type of vulcanizer, coupled with its moderate price, is considered, it is not surprising to note the large number of motorists who complete their own tire and inner tube repairs. In equipping the garage provision should be made for one of these members for repairing inner tubes and with the practical, automatic devices now marketed anyone can complete the work successfully. Punctures are experienced by all automobilists and they must be attended to.

Shaler Vulcanizer.

One of the latest vulcanizers is the Vul-Kit, made by the C. A. Shaler Company, Waupun, Wis., manufacturer of all types, including those operated by steam and electricity, and adapted both for the garage and private owner. That depicted in an accompanying illustration is not only very inexpensive, but embodies those principles essential for successful work, including that of maintaining the temperature at a predetermined point for a considerable length of time.



This is secured by the utilization of a gasoline generator which converts the fuel into gas, distributing the flame over the bottom of the vulcanizer, and producing and maintaining the desired temperature. It is provided with a universal clamping arrangement, insuring equal pressure and ease in handling. The tubes are placed on an inlaid asbestos pad, retaining the heat and preventing pinching. The handle is a non-conductor of heat and there is no danger of the operator being burned. It is easily operated, requiring but the filling of the combustion chamber with gasoline and the lighting of the fluid, the balance of the work being performed automatically. The Shaler Vul-Kit is nickel plated, very compact and is accompanied by a supply of repair material and complete instructions.

An electric type of vulcanizer is illustrated by the Gibney, it being operated by direct or alternating current and at 110 or 220 volts. As will be seen in the accompanying illustration the device is fitted with a rheostat, which is employed to decrease or increase the voltage entering the vulcanizer and thereby to raise or lower the heat.

The design may be employed for repairing cuts in casings and without removing the tire, and comes complete with ample length of cord, necessary tools, supplies, etc. It is manufactured by James L. Gibney & Bro., Philadelphia. The Waite Auto Supply Company, Providence, R. I., is agent.

(To Be Continued.)

President Harvey Granger of the Savannah Automobile Club, Savannah, Ga., has announced that N. H. Van Socklen of Chicago, president of the Chicago Motor Club and of the Chicago Automobile Trade Association, will be connected with the Savannah Automobile Club in an official capacity when the Thanksgiving Day races are run next November. He has had wide experience in racing matters and he will do much to make the official supervision of the Grand Prize and Vanderbilt Cup races a success.

Ashcroft Combination Valve Grinder Which May Be Utilized as a Ratchet Tool, Etc.

Digitized by Google

MOTORING LAWS AND THEIR ENFORCEMENT.

Organized Motorists in New York Protest Against Proposed Legislation---Connecticut Satisfied with Present Statute---News in Other States.

ENFORCE existing laws, was the basis of Charles Thaddeus Terry's reply to the attempt to amend the motoring laws of New York State at the recent hearing before the legislative committee. Mr. Terry, who is chairman of the legislative board of the American Automobile Association, also was acting as special counsel for the Automobile Dealers' Association and the Motor Truck Club, both of New York City, and the state automobile association. His objections were voiced particularly against the proposition to increase the registration fees on both pleasure cars and trucks; to give the secretary of state authority to revoke the license of any motorist, and to limit the weight of vehicles using the highways of the state.

With respect to the second proposition named, Mr. Terry holds that the secretary of state already has sufficient power under sub-division L of section 289 of the act of 1910, which reads as follows: "Before such a license is granted the applicant shall pass such examination as to his qualifications as the secretary of state shall require, and no license shall be issued until the secretary of state or his authorized agent is satisfied that the applicant is a proper person to receive it." As to the proposed increase in taxation of commercial vehicles, Mr. Terry says:

The proposition to increase the fees of commercial cars has nothing to support it. (1) It is against the general policy of the state not to tax an instrument of commerce. (2) It is taxation of a manufacturing industry. (3) The fees proposed would be higher than those required in any other state in the United States. (4) The fees imposed would increase the burden of taxation to a point where it would be intolerable.

This suggestion for the increase of fees came from the governor's committee of inquiry. It was based upon the assumption that commercial cars were exempt from taxation. This is not the fact. In fact the present motor vehicle law specifically excepts commercial cars from the exemption from taxation. So that if this bill became a law on a 10-ton truck a tax of $75 would have to be paid for a registration fee and in addition a personal property tax of about $150. This would make a tax of $225 a year. This would not be taxation, but confiscation.

LET WELL ENOUGH ALONE.

Connecticut Motorists Decidedly Object to Changes in Present Automobile Law.

The Connecticut Automobile Association is receiving the loyal support of practically all the local clubs in the state in its organized objection to 21 proposed amendments to the existing motoring statute. The motorists of the Nutmeg State see no reason for changing the present very liberal law, except in the matter of providing for universal lighting.

Particular objection is made to those amendments which seek to create a maximum speed limit. Two years ago, after long effort, the legislature was induced to insert a "reasonable and proper" provision, and experience is held to indicate that wherever the law has been enforced properly the results have been the best yet obtained. At the recent hearing several instances were cited in which it was maintained no attempt had been made to enforce the existing law, and the organized motorists claimed that every effort should be made to secure results before creating a situation which undoubtedly would revive the "trap" methods.

ELEVEN BILLS IN CALIFORNIA.

Motorists Urged to Examine Carefully Changes in Motoring Laws Now Pending.

While the organized motorists of California have been assisting the secretary of state in the preparation of a new motoring law, it would appear that others have been busy along the same line. No less than 11 amendments have been presented for action. The main provisions are set forth below:

Kehoe-Bennett Bill—Repealing present law and placing the licensing of automobiles and motorcycles in the hands of the highway commission, and establishing the following fees: Under 20 horsepower, $5; 25-30, $10, 30-40, $15; 40-50, $20; 50-60, $25; over 60, $35.

Avey Bill—Providing a penalty for refusing to give name and address in case of accident.

Schmitt Bill—Providing for the following fees: Under 25 horsepower, $5; 25-35, $10; 35-50, $15; over 50, $20; commercial vehicles, $5; motorcycles, $2.

Canepa Bill—Giving secretary of state authority to refuse to issue a license, and to appoint three persons to examine applicants for chauffeur's licenses.

Flint Bill—Prohibiting the possession or use of a car without permission from the owner, as well as the offering or accepting of a bonus or discount for the purchase of supplies, etc.

Stuckenbruck Bill—Regulating the speed of motor vehicles in regard to traffic and use of the highway.

Strobridge Bill—Making it a misdemeanor for a person who is crippled by the loss of one or both hands or who is deaf, dumb or blind, to operate a car.

Johnson Bill—Making it a misdemeanor for anyone to drive any conveyance in a reckless manner, or in a manner that is dangerous to others.

Shartel Bill—Providing for the protection of persons

Digitized by Google

and animals from reckless driving of motor vehicles on public highways.

Beban Bill—Providing for a license fee of $5 a year, and the examination of applicants for chauffeur's licenses.

Kehoe Bill—Requiring all vehicles to display a light or lights between sundown and sunrise, except on any street where street lights are maintained at a distance of 500 feet apart or less.

MOTOR TRUCKS IN PENNSYLVANIA.

Would Base Registration Fee on Weight of Vehicle and Load—Other Changes.

Senator Buckman of Pennsylvania has worked out a new list of registration fees for motor trucks. He also would require chauffeurs to file a bond of $1000 before receiving a license to drive. Operating a car while intoxicated or without the owner's consent is made subject to heavy fine and imprisonment. The provision for commercial vehicle registration reads as follows:

The fee for solid tired vehicles (motor trucks) shall be regulated by combined weight of vehicle and load, as follows: Less than 4000 pounds, $10; from 4000 to 5000 pounds, $15; from 5000 to 10,000 pounds, $20; from 10,000 to 15,000 pounds, $25; from 15,000 to 20,000 pounds, $30.

PROVISIONS OF KANSAS BILL.

Another Attempt to Regulate Use of Motor Vehicles in That Commonwealth.

Senator Wilson has introduced in the Kansas legislature a bill which he hopes to see enacted into law. Several objections have been filed by motorists and others. The chief features of the bill are presented below:

The registration fee of $2 a year for motorcycles and $5 a year for all other motor vehicles must be paid to the county treasurer, after which the receipt therefor shall accompany the application for registration to the secretary of state. Persons under 16 years of age and those who are intoxicated are not permitted to operate a car. Speed shall at all times be reasonable and proper, with maximum of six miles an hour at street crossings and eight miles an hour at dangerous points outside of cities and towns.

Non-residents are exempt from registration for 30 days, and the usual provisions for lights, brakes, signalling devices, etc., are included. Lamps must be lighted from one hour after sunset to one hour before sunrise, and must be visible 200 feet.

NON-RESIDENTS TO BE EXEMPT.

North Carolina Joins the Ranks of Those States Which Have Limited Reciprocity.

Heretofore non-resident motorists have been required to register their cars in North Carolina, unless they happened to be passing through the state without stopping longer than necessary. The bill now pending would amend this section so that cars registered in their home states shall be exempt from this provision for 15 days. The legislature has reconsidered its action requiring all cars to be equipped with speedometers. Other provisions of the proposed law of interest to non-residents are:

No person under 16 years of age shall be permitted to operate a motor vehicle on any public highway. Some cities have passed ordinances requiring all operators to be at least 18 years of age, and the act is so qualified that these ordinances are not to conflict.

The stipulated maximum rate of speed outside of incorporated towns has been reduced from 25 to 20 miles an hour. In cities and towns that rate is fixed at 15 miles for residential sections and 10 for business sections.

NEW WEST VIRGINIA LAW.

Bill Prepared by Ohio Valley Automobile Club Meets Approval of Legislature.

The legislature of West Virginia has enacted into law the bill prepared by the Ohio Valley Automobile Club. It does not appear to change the previous provisions for registration, or the non-resident privilege, and the important differences may be set forth as follows:

Applicant to drive a car as a chauffeur or paid operator must make affidavit that he is over 18 years of age, and must send a photograph taken within 30 days of the application to the state auditor. The fee is $2, for which a badge is issued.

The maximum rate of speed, which if maintained for more than a quarter of a mile shall be deemed "driving at a rate of speed which is not careful and prudent," is raised from 20 to 25 miles an hour.

Persons operating cars while intoxicated shall be subject to a fine of from $100 to $300, and the license shall be suspended for six months.

In case of accident causing injury or damages to the person or property of another, the operator is required to give his name and address.

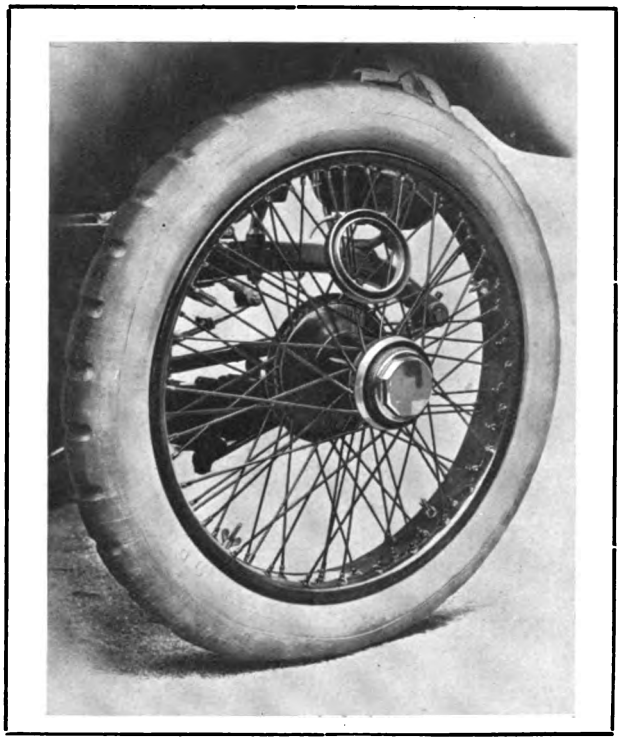
COURTS TO REVOKE LICENSES.

Power Vested in Police Judges Under Amendment Before Minnesota Legislature.

Several amendments to the motoring law in Minnesota, which has been in force for the past two years, have been agreed upon by the house committee on general taxes, and it is expected that they will be enacted during the present session. Three of the most important provisions are:

Fixing registration fee at $5 a car, which is expected to give a revenue of between $150,000 and $200,000 a year. This will be diverted to the state highways commission.

Vesting in police court judges the power of revocation of car licenses, and diverting of all police court fines for violation of the motoring law to the highways commission.



Creating a new state commission of three members to take the place of the present examining board.

THE RUDGE-WHITWORTH WIRE WHEELS.

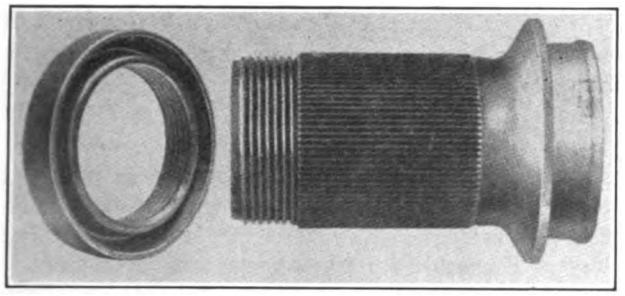
IN A previous discussion dealing with the subject of wire wheels it was pointed out that the development of this type has been more pronounced abroad than in this country. This should not be taken to mean that American made wire wheels are not the result of quite as much study and experimentation as those which are produced abroad. However, until very recently, practically within the past year, little attempt has been made in this country to market a substitute of this character for the American hickory wheel.

Perhaps the best known foreign wire wheel

Rudge-Whitworth Detachable Wheel, with Locking Ring Removed.

is the Rudge-Whitworth, made by Rudge-Whitworth, Ltd., Coventry, England. This wheel is now made in this country, under license from the British concern, by the Standard Roller Bearing Company, Philadelphia, for which the George W. Houk Company, 5001 Lancaster avenue, Philadelphia, is selling agent. Although it is by no means the pioneer American product in this line, using the term with reference to modern wire wheels, a description of it will prove of interest as indicating the progress that has been made abroad.

The Rudge-Whitworth firm has been making wire wheels for a number of years, almost since the inception of the automobile industry, but it may be said that the detachable form did not make its appearance until some five years ago. This has been refined and perfected until the present product is regarded by the maker as being all that could be desired for automobile road suspension. The wheels produced by the Standard Roller Bearing Company are made under the direction of engineers who studied every detail of their manufacture in the Coventry shops. The exact formulae for the steels that enter into their construction have been adopted, and duplicates of the special testing machinery employed in England are used, so that every wheel that leaves the Standard Roller Bearing Company's factory is guaranteed to be interchangeable and equal in every respect to the Rudge-Whitworth Coventry product.



The Rudge-Whitworth wheel really comprises three parts—the outer stamped steel shell, to which the steel wire spokes are attached; the inner hub and the locking nut. The inner hub and the locking nut constitute the main points of difference between this and other constructions, although the material of which the shell and spokes is composed conforms to special formulae and is treated with a patented rust preventing compound. The Rudge-Whitworth wheels made in this country are fitted with the Houk quick detachable rim, which is held to be an additional feature of merit.

It is maintained by the British maker that the triple-spoke formation utilized in these wheels entirely overcomes the possibility of spokes becoming loosened. In addition, it is claimed that this construction produces a wheel that is scientifically braced from every point. Seventy spokes in tension throw the wheel into compression, making it perfectly circular. Engineers claim that this form permits the plane of the tread to be carried toward the centre line of the car almost at will, and that the triple-spoke wheel is a stronger construction, weight for weight, and is the acknowledged superior.

The arrangement of the spokes is brought out at A, in an accompanying sketch showing a sectional view of the hub, shell, spokes and rim. It only needs to be added that the spokes are attached to the shell and rim in much the same manner as with the bicycle wheel, and their replacement, in event of their becoming bent or broken, is quite as simple.

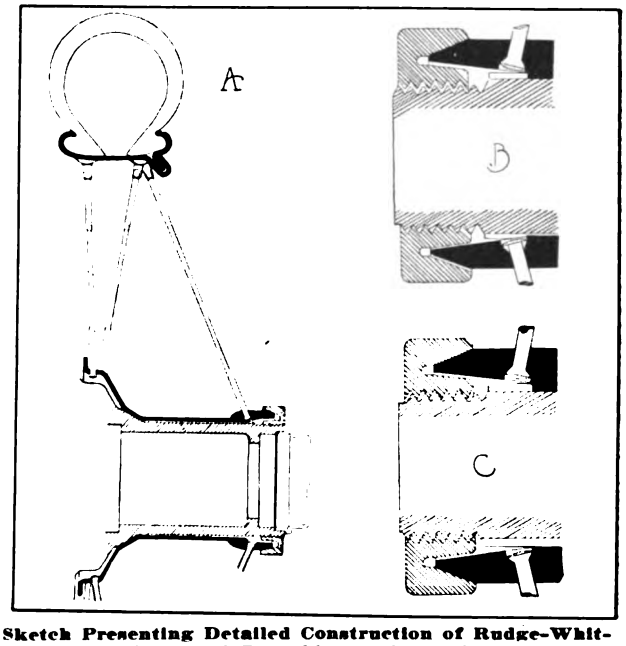
Digitized by Google

The inner hub, or as it is sometimes termed, the fixed hub, is fitted to the axle and its size varies with the axle and the bearings of the car

Locking Ring and Inner Hub of Rudge-Whitworth Wire Wheel.

for which it is made. Along this inner hub barrel long serrations are cut, and at the outer end there is a screw thread of substantial dimensions On the inner surface of the shell are a number of grooves extending lengthwise of the hub, which engage with the serrations on the inner hub. It is through these parts fitting into each other that the drive is transmitted from the axle to the wheel, and care is taken in machining so that the shell can be slipped on the hub in any position with reference to its circumference. It is emphasized that these serrations take all of the driving and braking strains, which are not thrown upon the locking device at all. It also will be noted that the hub takes the form of a taper or wedge.

The wheel is locked upon the inner hub by screwing on the locking nut or ring, which engages with the threads on the end of the hub and with the taper face on the outer circumference of the shell. Only the tapered or V shaped portion of the ring engages with the taper or wedge shaped portion of the shell, so that screwing up the locking nut necessarily is a self-centring operation.



There is a slight clearance between the inner hub and the shell, and the teeth, though a good fit, are not tight, so that the removal or replacement of the wheel itself is accomplished easily. On the other hand, the wedge action of the locking nut is such that it not only locks the wheel immovably, but centres it on the inner hub.

Another feature is the provision for self-locking. While the maker supplies the regulation spanner, which is necessary for loosening the locking nut for removal, it is maintained that it is feasible to tighten this nut as far as possible with the fingers, when the rolling action and weight of the car will complete the process. It is held that this self-tightening has nothing to do with the driving torque or braking, but is merely a question of eccentricity and weight, the effect of the weight being to resolve eccentricity into concentricity, when the action of self-locking ceases.

The accompanying sketch brings out this feature. B shows the locking nut screwed on loosely, and it will be noted that it bears upon the top and outer taper of the shell, but not on the bottom, the locking of the ring onto the hub is entirely upon the outer surface of the latter. That is to say, the locking ring does not bear upon the shell at all on the inner side of the V groove. The self-locking action takes place between the ring and the shell where they touch at the top, and is produced wholly by the rolling action and weight.

As the ring locks up, it begins to bear all around instead of at the top only, so that as soon as contact is continuous the whole way around the locking action ceases, as the two surfaces are no longer eccentric to each other. C in the sketch shows the relative positions of the inner hub, shell and ring when the last named has tightened itself. All parts are now concentric. The locking nut has grasped the taper of the shell all around its circumference and centred it. The drawings are with the details considerably exaggerated, the better to explain the proposition.

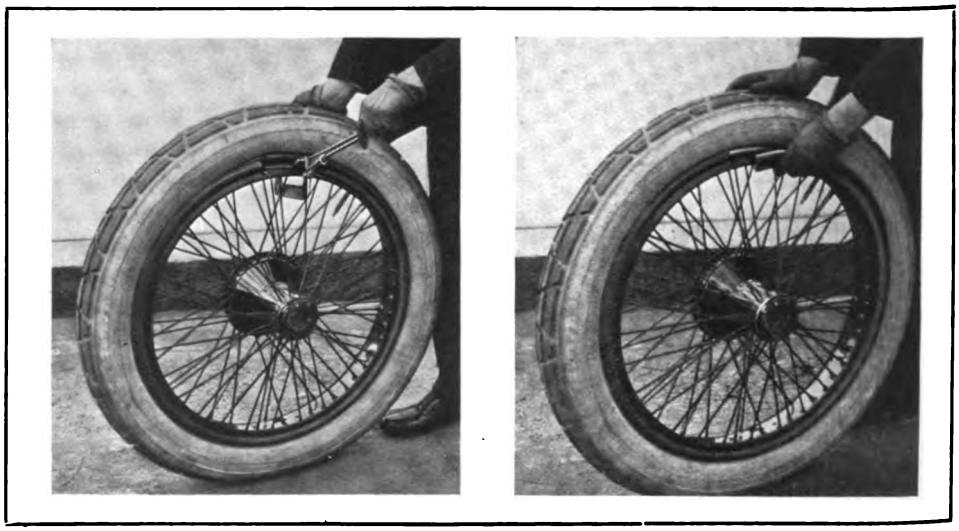
Experiments under actual driving conditions have shown that when the wheel has been re-

Sketch Presenting Detailed Construction of Rudge-Whitworth Wheel, and Detaching and Locking Means.

moved and replaced and the locking ring screwed on loosely by hand, it was fully tightened within less than a mile of travel, so that it could not

Digitized by Google

be undone without using the spanner. One question has arisen—since the wheel locks itself, will it not be possible for it to unlock in a similar manner? In answering this, it is pointed out that this could only take place, if at all, when the car was driven backward, and since it takes something less than a mile of travel to tighten it one revolution of the thread at the outer end of the inner hub, there is little danger from this source. Moreover, it is claimed that once the ring is fully locked it cannot become unlocked except by using the spanner. This spanner is provided with a short projection which fits into one of three small holes in the outer periphery of the locking nut, so that the position of the wheel is at all times such that the tool may be used with ease.



Houk Locking Ring Completely Removed from Wheel.

The Houk quick detachable rim, with which the American Rudge-Whitworth wire wheels are fitted, is decidedly simple in operation, there being no bolts or nuts used in locking the ring. The detachable feature consists merely of a locking ring which is fitted over the edge of the rim, automatically springing into position, and being held there firmly by its own spring. It is maintained that it does not depend in any manner upon the inflation of the tire to be held in place, and in addition it is claimed to be impervious to water. It is light in weight, and by reason of its double section on the outer edge of the rim it is held to be next to impossible to injure it by coming into contact with road obstructions.

The cross section of the wheel at A presents the construction of this rim as well. Other illustrations indicate its simplicity in operation. One end of the tool fits against the wheel rim on the opposite side and forms a bearing against which it is possible to pry the locking ring out of its groove. One or two such movements along the edge of the rim is sufficient to loosen enough of the ring to enable it to be grasped by the hand, when the entire ring may be withdrawn. The replacement is equally simple. One end of the ring is fitted and the remainder sprung into place.

The advantages claimed for wire wheels were fully set forth in a preceding article, and these are held to apply to the Rudge-Whitworth. Inasmuch as these wheels have seen extended service abroad, it is maintained that they prove the maker's contention in every respect. Particular emphasis is laid upon their strength, and that they will withstand severe stresses is held to be evidenced by the result of an accident to a car while running at 75 miles an hour. Although the tires were wrenched off, it is pointed out that the wheels were undamaged beyond a bent rim and spokes, which were soon realigned.

Removing Houk Quick Detachable Rim from Rudge-Whitworth Wheel: At Left, Loosening the Locking Ring by Use of Special Tools; at Right, Springing It Free From the Rim After Connection Has Been Broken.

PEUGEOT DRIVERS NAMED.

Goux and Zucarrelli Will Handle French Machines in Memorial Day Event.

Definite word has been received from the Peugeot Company of Paris, France, that two of its fastest cars, with Jules Goux and Zucarrelli as drivers, will be entered in the third annual 500-mile international sweepstakes race at Indianapolis, Ind., May 30. This rumor has been current for some time and its official confirmation by the Peugeot company adds unusual interest to the coming contest, it being assured that the event will be truly international in character and will prove to be the greatest automobile race ever staged on an American track, if not in the world.

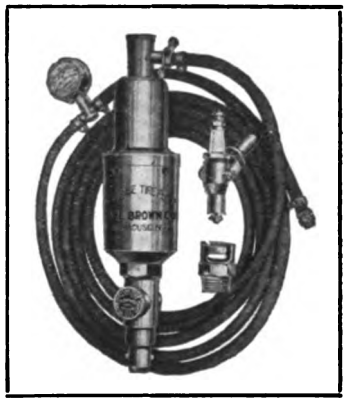
The Peugeot cars have left the factory and are being tested under the supervision of the engineers who designed them. According to present arrangements, Goux and Zucarrelli will arrive in America about May 12, and will proceed immediately to Indianapolis, where they will have a chance to become thoroughly acquainted with the speedway before the day of the race. Albert Guyot, who is to pilot the famous English Sunbeam car, will arrive about the same time and will also train at the speedway.

Owing to the fact that all of these drivers are scheduled to drive in the French Grand Prix, July 12, it will be necessary for them to return to France immediately after the Indianapolis race. Boillot, another Peugot driver, who had hoped to come to America with his team mates, will be compelled to remain in France preparing cars for the Grand Prix.

FORMS CHAUFFEUR'S BUREAU.

New Haven Club Will Supply Members with Information Concerning Drivers.

The governing board of the Automobile Club of New Haven, Conn., has established a chauffeur's bureau, through which members will be supplied with information concerning men who are seeking employment. It is pointed out that the object is to enable chauffeurs to secure good positions, as well as owners to obtain satisfactory service.



Information as to the chauffeur's age, nationality, habits, etc., is filed by his employer, and provision is made for revising this from time to time as occasion requires. Members who desire employees are permitted to call upon the secretary for this information without expense.

BROWN IMPULSE TIRE PUMP.

Utilizes the Power of the Motor, Eliminating Arduous Manual Labor.

Operating a hand pump in inflating tires is a task that is not relished by the motorist, especially on a hot day. Pumping troubles are dispensed with by utilizing the power of the motor and in the accompanying illustration is shown the Brown Impulse tire pump, a device that may be quickly attached and the shoe inflated without any other attention than watching the pressure gauge.

The pump operates on the compound principle, conveying only cool, pure air to the tire. The taking in of gases from the cylinder is prevented by a special breather valve having a tension of three ounces. The maker states that the ordinary motor has about five feet of vacuum, and the atmospheric pressure of 15 pounds to the square inch immediately overcomes this vacuum and the pure air replaces the gasoline vapor. There is less resistance in the valve than is encountered in the intake manifold of the motor.

Brown Impulse Tire Pump.

The equipment comprises the pump, the Brown quick detachable spark plug, 12 feet of high grade hose, a guaranteed gauge and a self-opening valve connection, all packed in a substantial wooden box. The plug is of the bayonet type and a quarter turn removes the core containing the electrodes, permitting the insertion of the pump proper, which is securely locked by a similar movement of the hand. The hose and connection are then attached and the motor operated at a slow rate of speed while the tire is being inflated. The pressure gauge is conveniently located and any number of shoes may be pumped up without stopping the engine.

The spark plug is constructed on principles indorsed by ignition experts, is adaptable both for battery and magneto, and the firing points are adjustable. The pump is constructed of high grade material, with valves of polished brass, and the finish in two coats of gray enamel. It is manufactured by Brown Company, Syracuse, N. Y.

CORRESPONDENCE WITH THE READER.

Noting Battery Discharge.

(1500)—To ascertain the condition of dry cells we use an ammeter. For testing storage battery cells a voltmeter is employed. We are told that the ammeter cannot be used for measuring the storage battery, yet we can use the voltmeter on dry cells. And I note that some lighting systems on cars using dynamos have ammeters on the dash. This point is not very clear to me and I should like to have an explanation. If the ammeter can be employed in lighting systems why cannot it be used with the straight storage battery system?

REASON.

Malden, Mass., March 10.

The use of an ammeter for testing dry cells by short circuiting it across its terminals for an instant, has proved sufficiently satisfactory for a continuation of the method. Because it is done it is difficult for the layman to understand why the same instrument is not applicable to the storage battery.

Some idea of the difference may be gained by

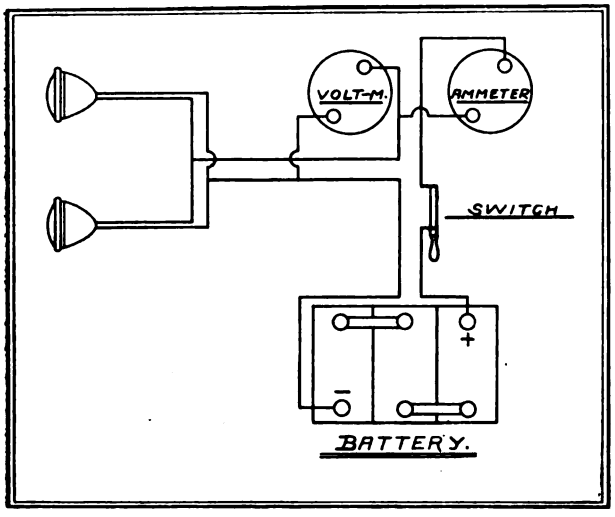

Fig. 1—Illustrating Use of Voltmeter and Ammeter in Straight Storage Battery System of Lighting.

remembering that the internal resistance of dry cells is comparatively high and the chemical action comparatively slow, while the chemical action of the storage battery is very rapid and internal resistance very low when its elements are connected, and that rapid chemical action is productive of heat. It should be borne in mind that in charging a storage battery a difference in potential between the plates (positive and negative), is created, and that if the plates were joined together the difference of potential would instantly become equalized. It is this process of equalizing that gives off the current making the battery useful. Thus it will be seen that it is desirable that the cells be discharged slowly.

An ammeter is of such low resistance that to all intents and purposes connecting it across the terminals of a storage battery would bring about practically the same conditions as connecting the plates directly. For this reason a voltmeter is employed because it has high resistance and requires practically no current to operate it.

Regarding the ammeters utilized in connection with dynamo lighting systems on automobiles, it will be noted that the maximum reading of the scale is from 15 to 20 and that provision is made for denoting the charge and discharge rates. These instruments indicate the amount of current being drawn from the cells, not their capacity.

Regarding the question as to whether an ammeter can be employed with the straight storage battery system, the diagram presented at Fig. 1 will show the method of incorporating both instruments in the circuits. In this installation the voltmeter would indicate the strength of the current and the ammeter the amount being drawn for heating the filaments of the lamps, which would be small in comparison with that capable of being supplied by the battery.

Bosch Magneto.

(1501)—I have a 1912 ——— car which employs a true high-tension Bosch magneto. While out riding the other day the motor stopped suddenly and refused to start after repeated trials at the starting crank. Finally I was obliged to be towed back home. Not being familiar with magnetos I called in a repairman from a neighboring repair shop, who examined the instrument and informed me that the points did not separate, that the fibre block on the breaker arm had worn down. He said that the breaker box was full of fibre dust when he removed the cover. A new part was secured and fitted and the magneto is as good as ever. His explanation of the parts was so meagre I would like to be posted as to what to do if it ever occurs again.

SUBSCRIBER.

Providence, R. I., March 10.

The best plan would be to prevent the entrance of grit or foreign elements to the breaker box. The fact that the fibre block wore so badly was doubtless due to some form of abrasive working into the breaker box, which acted as would a piece of emery cloth or sandpaper upon the fibre. The latter is a very important component in that it causes the movable arm to which it is secured, and which carries a platinum contact point, to separate the points, breaking the primary circuit. Its principle is the same as the conventional timer employed in the battery and induction coil system of ignition.

The break is caused by the fibre block coming in contact with cams, depressing the arm member and thereby breaking the contact between the platinum points. The abrasive in the breaker box

Digitized by Google

reduced the thickness of the fibre block to such an extent that while it may have touched the cams it was not sufficient to separate the points, therefore the primary circuit was grounded practically in the same manner as when the switch lever was thrown to stop the operation of the motor.

It is evident that the magneto is mounted in such manner that it is exposed to dust and dirt or else the cover to the breaker box was not secured properly. It is advisable to clean out this member from time to time, employing a soft, dry brush. Lubricants should not be used as the fibre would become swelled and create trouble. If the instrument is exposed to dirt, etc., it would be advisable to purchase a leather cover. They are not expensive and will keep out foreign elements as well as moisture.

Trouble of the kind referred to is not common. If desired, an extra arm with fibre block may be secured and carried in the car. It is a simple matter to remove the old member and fit the new, requiring but the displacement of a locking nut and long screw. If the breaker box be given attention and the magneto protected from dirt, a repetition of the trouble will be avoided.

Current Rectifying.

(1502)—I understand that you printed an article on charging lighting batteries by an automatic rectifier. Can you give me information concerning the same and who is the maker of the device? F. A. B.
Jackson, Mich., March 11.

The article appeared in the Oct. 25th issue of The Automobile Journal and the instrument was an Edison alternating current rectifier which is presented at Fig. 2. It is made in two sizes, one providing a charging capacity of eight amperes and the other 16, and with the unit shown a regulating rheostat is provided. Complete information will be forwarded free of charge by the maker, Thomas A. Edison, Inc., Orange, N. J.

Parry Car Parts.

(1503)—Where can I secure parts to a Parry automobile? H. W.
Waltham, Mass., March 15.

The parts referred to may be secured from the Motor Car Manufacturing Company, Indianapolis, Ind.

Oil for Ford Cars.

(1504)—What is the best and cheapest oil for Ford cars? Where could I buy a second-hand White gasoline machine? What concerns make inner tube linings and leather trunks? T. H. M.
Holbrook, Mass., March 13.

The best oil is the cheapest with any automobile. The refiners have conducted a series of exhaustive tests to ascertain which grade is best adapted to each type of motor and the information will be furnished free upon application. In the Classified Buyers' Guide are given the names and addresses of makers, also those manufacturing reliners and trunks. Regarding the White car, the Boston branch of the White company should be able to supply information.

Flash and Fire Tests of Oils.

(1505)—What is meant by flash and fire tests of cylinder oils? What has viscosity got to do with it? I note mention made of the high flash and viscosity of lubricants advertised by different concerns. I take it for granted that any high grade oil is good oil, but why the technical terms? MOTORIST.
Mechanicsburg, Penn., March 18.

The terms referred to are employed in testing lubricating oils. They are five in number—specific gravity, flash, fire, cold and viscosity. The specific gravity was the first standard established for determining the quality of lubricating oils, but it is not now regarded as a conclusive test of quality. However, as the specific gravity of a particular petroleum oil increases the viscosity also increases.

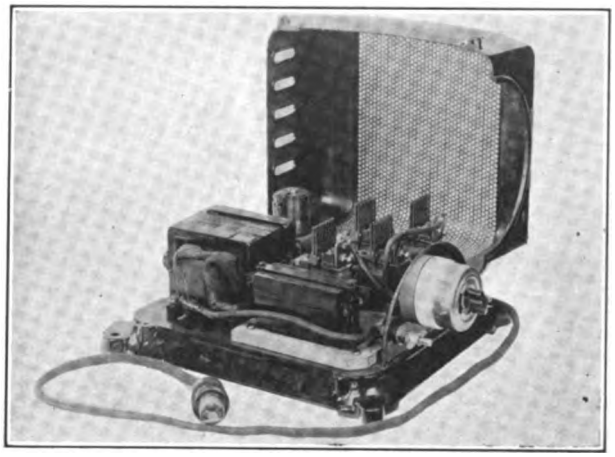

Fig. 2—Edison Alternating Current Rectifier, Adapted for Charging Storage Batteries.

The object of the flash test of a lubricant is to determine the point at which the vapor will ignite, but not burn, while the fire test indicates the burning point. This prevents danger from fire through the use of an oil that will evolve inflammable vapors. The cold test of an oil is the temperature at which it will congeal. It should be well below that at which it is used, otherwise the coefficient of friction would be correspondingly increased.

Viscosity, or fluidity, is the body of an oil, which is usually expressed in seconds of time in which a given quantity of lubricant will flow through a certain orifice at the temperature

Digitized by Google

stated, comparison sometimes being made with water or sperm oil or rape seed oil.

Maker of Alpha Coil.

(1506)—I have an Alpha coil and desire to secure a new contact screw. Can you give the name of maker and address? W. P. H.

Cassville, Wis., March 8.

The writer does not recall the coil mentioned. Perhaps some reader may know the maker and forward the address to this office. If the platinum point is destroyed it could be replaced with new material by any jeweller, or a screw may be made to fit the part if a new one cannot be purchased.

Rattling Windshield.

(1507)—I am troubled by the windshield on my car rattling. Have been over it very thoroughly and tightened up all parts. The noise seems to come from shield itself, where it rests in the frame. Any suggestions as how to cure the noise will be appreciated. WINDSHIELD.

Dayton, O., March 13.

It is probable that the channel rubber employed to absorb the vibration has become hardened and lost its usefulness. If this material is utilized replace with new.

Backs Car Up the Hill.

(1508)—The stunt of a driver of a commercial truck the other day struck me as particularly interesting and while it may not be a new one it may be of value to some of your readers who find themselves in a similar predicament. The operator started up a hill with the machine loaded, but after part way up the motor stopped. After trying the usual tests he discovered that the height of the carburetor was more than that of the fuel in the tank. Releasing the brakes the driver allowed the car to coast down, after which he started the engine, turned the truck around and went up the hill on the reverse. This brought the gasoline tank considerably higher than the carburetor. SUBSCRIBER.

Boston, Mass., March 20.

FORD CREATES NEW RECORD.

Spokane Motorists Claim Three Cross Country Marks in Washington State.

Three intercity speed records are now held by Spokane motorists, the last established being by F. A. Williams, who drove a Ford car, made by the Ford Motor Company, Detroit, from Seattle to Spokane, Wash., a distance of 339 miles by railroad, in 23:15:00, crossing the Cascade mountains en route.

The first automobile Washington run advertised as a speed contest, and in which judges were appointed, was held in August, 1909, when Murray made his record run from Coeur d'Alene to Spokane in a Buick machine, made by the Buick Motor Company, Flint, Mich., covering 32.6 miles in 35:37. The second run was made in April, 1910, between Spokane and Walla Walla, when H. M. Eastman covered the round trip, registering 326 miles, in 12:59:00 in a Cadillac touring car, made by the Cadillac Motor Car Company, Detroit.

IMPORTS AND EXPORTS.

Government's Annual Report for 1912 Shows Splendid Increase in the Latter.

The annual report of the bureau of foreign and domestic commerce of the United States government relative to the imports and exports of automobiles during the past year, for the 12 months ending Dec. 31, 1912, indicates an increase in the exports of practically 50 per cent., while the imports for the same period showed a slight decrease. The following tables show the comparison for the two years:

December Imports.

	1911		1912	
Country	No.	Value	No.	Value
France	47	$108,687	43	$100,589
Germany	13	28,086	7	19,523

TWO BODY TYPES FOR CUTTING CHASSIS.

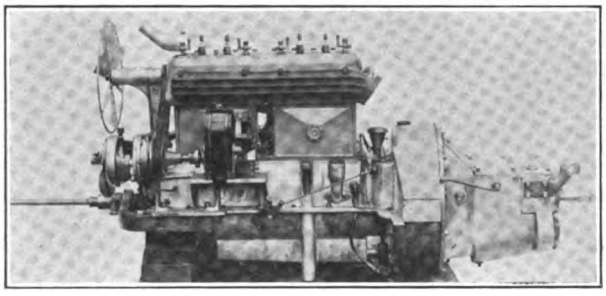
BELIEVING that the production of two models instead of six as formerly, will permit of improving the quality as well as increasing the output, the Cutting Motor Car Company, Jackson, Mich., is producing one chassis to which is fitted two types of bodies, these including a two-passenger roadster and a five-passenger touring car, and both are very attractive in design. While the changes are largely in the nature of refinements the company adheres to those principles of construction indorsed by sound engineering practise. The most important improvement is the adoption of the unit power plant suspended at three points. Last season the transmission was located amidships.

The new power plant is very compact and is noticeable for its simplicity and accessibility of components. It is a four-cylinder, water-cooled unit of the L head type, and cast en bloc with the water jackets integral. The cylinders are finished with open tops, closed by a bronze plate member which serves as the exhaust water manifold. This construction permits of easy cleaning of the water jackets. The bore is four inches and stroke five, and although the horsepower rating by the S. A. E. formula is 25, the Cutting power plant develops considerably in excess of this in brake tests, having a piston displacement of 251.3 cubic inches.

The ground pistons are fitted with four rings of the eccentric type and four oil grooves insure proper lubrication. The connecting rods are 12 inches long, of drop forged high grade steel, and the small ends are secured to hollow tool steel wristpins, which are retained in the piston bosses by lock screws. The crank and camshaft are of a 40 per cent. carbon steel, the former rotating in three bearings of Parsons white bronze and these are 2.75, four and 2.75 inches, respectively. The crankshaft is 1.75 inches in diameter. Three bearings are employed for retaining the camshaft and the bearing material is bronze, as are the big ends of the connecting rods.

The crankcase is of aluminum, divided at the centre. The valves are located on the left hand side of motor, have nickel steel heads and carbon steel stems electrically welded. The port diameter is liberal, 2.625 inches, and the valve mechanism is enclosed by easily removed plates.

Cutting Five-Passenger Touring Car Having Attractive Lines and Being Fully Equipped.



The carbon steel tappets have bronze guides and are adjustable by a screw and locknut. Spiral timing gears, enclosed in a bronze case, make for noiseless operation.

The carburetor is a Schebler fitted with a hot air attachment and the feed is by gravity. The fuel capacity of the roadster is 25 gallons, that of the touring car being 15. Ignition is by the late model Remy magneto and dual ignition is provided by an 80 ampere-hour capacity storage battery. The magneto is located on the left hand side of the motor and is positively driven through shaft and coupling. The pulley driving the adjustable fan is fitted to this shaft and the entire construction is sturdy and accessible.

The lubrication system is of the circulating type, a gear pump located on the outside of the

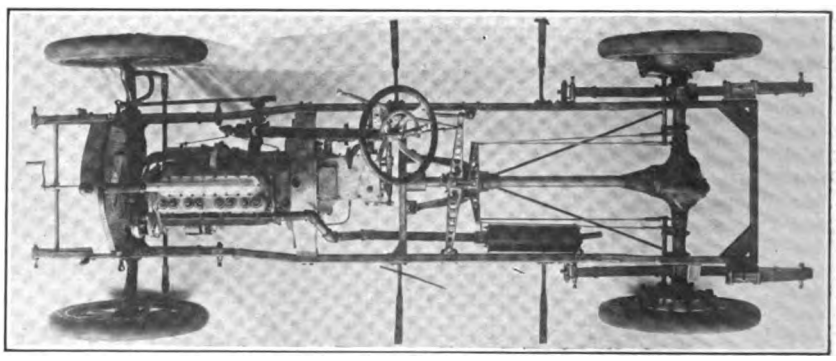
Digitized by Google

lower crankcase being driven by spiral gears from the camshaft. The lubricant is forced to a main duct cast integral with the crankcase, thence

The Unit Type of Power Plant Is Employed—Note the Compactness and Liberal Sized Inspection Plates.

distributed by other ducts cast in the web, to the main bearings. From this point it is forced through the hollow crankshaft to the connecting rod bearings. The circulation of the oil through the crank arms and connecting rod bearings is in the direction of centrifugal force and a sufficient amount of lubricant is thrown to thoroughly lubricate the pistons and camshaft, which are provided with pockets. A fine wire gauze is brazed to the opening of the pump, preventing the entrance of foreign elements. The oil gauge is located on the exhaust side of the motor, extends to the level of the crankcase, and the height of the lubricant is indicated by a float and ball. Marks are provided on the glass gauge to denote high and low. By maintaining the proper level smoking is eliminated. The company states that the system is so efficient that one gallon of lubricant will operate the motor 800 miles.

Circulation of cooling fluid is by a centrifugal shaft driven pump and the intake and outlet water manifolds are ample in size. The radiator is of the square tube type and cooling is further aided by a pressed steel, one-piece fan.



The three point suspension is utilized, the power plant being supported at the front by a steel casting extending from both sides of the crankcase to the centre of the front cross bar. There is a large bearing permitting the motor to swivel, compensating for torsional stresses to the frame. The two rear supporting arms on the motor extend to the frame.

The clutch is a multiple disc comprising 15 plates operating in a bath of lubricant. It is very accessible for adjustment and easy engaging qualities are emphasized with the design. The transmission is of the selective type, providing the conventional three speeds forward and a reverse, with direct drive on the third. The gears are carefully cut and finished from 35 point carbon steel and their size and width make for durability. Large sized annular ball bearings are employed throughout. Liberal inspection plates permit of examination and the replenishment of the supply of lubricant.

Power is transmitted to the rear wheels by a shaft of ample size and high grade material, and a well designed universal joint is fitted at the rear of the transmission casing. The propeller shaft and universal joint are anchored to the middle cross member, and the latter is removable, being bolted. The shaft yoke is carried on two brackets anchored to the cross member, and has two large steel bushings, cotter keyed to the bracket. The employment of bronze bushings in the yoke makes for easy replacement in the event of wear and at a minimum of cost. Annular ball bearings are utilized.

The rear axle is of the semi-floating type with differential and shaft housing of malleable cast iron. The axle shafts are of carbon steel, 1.375 inches in diameter, and rotate on roller bearings. The differential gears are of nickel steel, ample in size, and roller bearings are employed. The inspection plate is liberal in size and very accessible.

The frame is of pressed steel, .1875 inch thick, is provided with the usual kickup at the rear and is inswept at front, making for a short turning radius. The springs are semi-elliptic in front, 40 inches long and two wide. Nine leaf three-quarter elliptic, 40 inches long and two wide, are fitted to the rear. All bolts are provided with grease cups and the springs are well shackled.

drop forged, and has the conventional drop in the centre. The spindles are provided with the ball and cone type of bearings and the tiebar is

The Brakes Are Ample in Size and Separate Equalizers Are Employed with Each Set.

tubing, located in the rear of the axle. The yokes are drop forged, and their size provides an ample margin of safety.

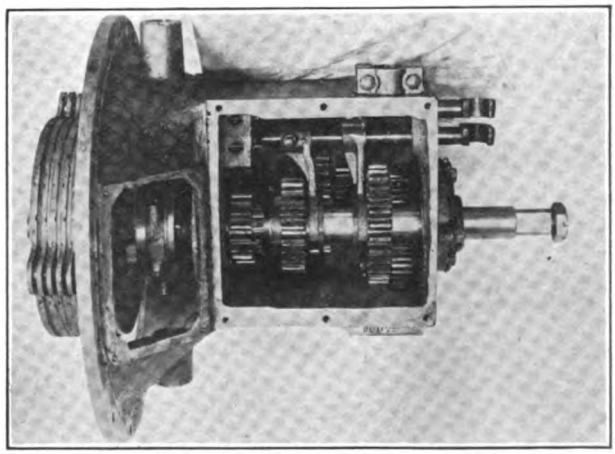
Two sets of brakes are provided and the drum has a diameter of 14 inches and face of two, making for efficient braking capacity. The service members are of the external contracting type with emergency internal and actuated by lever. Both are faced with Raybestos. The bar evener equalizing system is employed, both brakes having separate and distinct equalizers, a construction assuring efficiency.

Artillery wheels of second growth hickory are employed and ball bearings are utilized. The rims are of the quick detachable demountable design and 36 by four-inch tires are fitted both front and rear. One extra rim is standard equipment. The wheelbase is 120 inches and tread standard, 56.

The steering gear is of the worm and gear type and a noticeable feature is the ample size of its components and linkage. The column is set at a comfortable angle and is surmounted by an aluminum spider to which is secured the 18-inch black walnut notched wheel. Provision is made for proper lubrication by the fitting of grease cups in accessible positions.

The spark and gas levers are mounted on the wheel. The driver is located at the right with gear shifting and emergency brake levers inside of the body. The clutch pedal is placed at the left with service brake pedal at right, and the usual accelerator is located in the footboard in a convenient position.

Both the roadster and touring bodies are of the fore door type and the designs are noticeable for their straight lines and attractive appearance. The bodies are of pressed steel and a feature of their construction is the fitting of the doors, which are flush and have locking mechanism within. The fenders harmonize with the lines of the bodies and with the utilization of well fitted splash aprons there is no reason why the passengers should not be fully protected from mud or water.



The upholstery is a high grade black leather and the cushions are deep and fitted with comfortable springs. There is ample room in the tonneau as well as in front and the designer has made every provision for comfort on long trips.

The roadster is striking in appearance and the usual deck fuel tank is fitted at the rear of the seats. A large sized trunk is also carried at the rear. The models are well painted, royal blue being used, a rich, neat color. The company calls particular attention to the finish, which is not only high grade, but very enduring.

The cars are fully equipped and include a high grade mohair top with dust boot, clear vision windshield, horn, pump, jack, tools, etc. The holders are fitted at the rear and the touring car is provided with a robe rail. The roadster is equipped with foot rail.

The headlights are acetylene and are lighted from the dash. The equipment includes a Prest-O-Lite tank. The motor starter is of the acetylene type, a Hanna, but a combined electric lighting and starting unit is installed at a slight additional cost, provision being made for the installation of the system.

The Cutting models are designed to meet the

Multiple Disc Clutch and Transmission of Cutting Chassis —Note the Ample Sized Gears.

requirements of motorists desiring a serviceable car having plenty of power and capable of being maintained at a minimum cost.

Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.

Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

STILL AMERICA'S BEST SHOW.

Whatever question there may have been in the minds of those interested in the automobile industry as to the continued importance of the Boston show must have been dispelled as a result of a visit to Mechanics' building during the progress of the recent 11th annual exhibition of pleasure cars. In every way it was biggest and best, fully bearing out all previous predictions. Never has there been a prettier setting for the show. The number of makes on display exceeded all others held this year. More special bodies were to be seen. The list of accessories was most complete. And best of all, the amount of business transacted even exceeded expectations.

It cannot be denied that the value of the automobile display is measured by the business developed. This does not necessarily apply alone to sales, although it is exceedingly gratifying to note that in this respect this year's Boston show was quite as prolific as ever. There is the additional source of future business to be found in the prospects revealed, and the enthusiasm created also has its weight. There can be little doubt that in these other factors the recent exhibition suffered no diminution in importance.

Insofar as the commercial vehicle section is concerned, the results are even more far reaching. It is expected that there will be a noticeable difference in the appeal made by the two types of cars. Motor trucks and delivery wagons are considered strictly on a business basis, as they should be, and the value of the show is quite as much along the lines of an educational campaign as in the closing of sales. There is abundant evidence, however, that the Boston commercial vehicle display was quite as successful in the latter respect, as well.

In view of the rapid development of the automobile industry and its growing importance in the industrial life of the nation, it is not surprising that other cities envy the position held by Detroit. New York City appears to be very much in earnest in its effort to secure a substantial share of the manufacturing in this line. The committee in charge of the movement does not seem to have overlooked any of the arguments in its favor, among which that of the market afforded is by no means the least important.

The fuel problem promises to be uppermost in the minds of manufacturers and owners during the next few months. The discovery of the new fuel, motor spirit, does not seem to offer the complete solution that is expected. Those who read carefully between the lines cannot help but gain the impression that the practical kerosene carburetor is shortly to make its appearance, and on some of the best known cars.

Although there has been decided effort to secure amendments to the so-called reciprocity law of New Jersey, which in a greater or lesser degree would cause a return of the discrimination against non-resident motorists, it is now stated that there is little likelihood that any changes will be made this year. Former experience appears to have convinced a majority of the people in New Jersey that such methods do not pay.

A gain of practically 50 per cent. in the value of automobile exports for the year, with an aggregate of $23,703,989, indicates the importance of this industry in international circles. There is small wonder that the foreign manufacturers are seeking to learn how it is accomplished.

PROTECTING THE CUSTOMER.

President Joy Explains How the Public Suffers from Price Cutting Methods.

Automobile salesmanship has undergone a decided change within the past few years. Methods which were in vogue in the earlier days of the industry are no longer tolerated. Henry B. Joy, president of the Packard Motor Car Company, Detroit, sets forth the value of the established retail price fixed and maintained by the manufacturer, as follows:

An established retail price fixed and published by a responsible manufacturer is for the consumer's protection. The control of the retail price by the manufacturer, when the fixed and published retail price is actually, honestly and inviolably maintained by the manufacturer and by his representatives, the retail dealers, is the only honest, square way to insure fair dealing between the manufacturer and his patrons. Such a method and such only is square, honest business.

When, however, such a retail price is only "ostensibly established" by a manufacturer, but is fixed "high" for the purpose of having something to "throw off," to negotiate with or "trade" with, it is crooked business. The manufacturer who does it is crooked and the retailer or dealer also is crooked. The trusting or unskilled buyer is "fleeced."

The Department of Justice is, by pending litigation under the Sherman act, seeking to prevent the control of the resale price to the consumer after the sale of the product to the dealer by the manufacturer has been consummated. This is wrong in principle and wrong in fact. It tends to force and actually will compel "unfair competition," resulting in one price to one consumer and another price to another.

We have demanded that the railroads should establish, publish and maintain equal freight rates to all. Why are we so fussy about railroad rates? Yet we institute legal proceedings to prevent the Kellogg Toasted Corn Flake Company from treating all the consumers of its product alike. The government would be in better business if it sought to compel equal treatment to all.

If the Department of Justice sought to compel a manufacturer to maintain established list prices by interpreting the Sherman act to mean that cut prices below the manufacturers' fixed and published prices was conspiracy in restraint of trade, which it actually is, great good would be accomplished in promoting honesty in business.

We jailed and fined railroad officials for cutting prices on freight! Why is not the same principle applicable to products of manufacturers in relation to the consumers of their goods? We have a right to demand equal and fair treatment to all. Competition will still exist in its broadest and best sense and in the most beneficial form to all concerned.

If a manufacturer establishes and publishes a consumers' price he should be compelled to maintain it, and if a sale at less than list price can be proven to have been made by his dealers or agents, then all sales for a period of say 30 days prior to the "cut price sale" should be adjusted to that basis.

In such a condition it is plain that published prices would be maintained. The confiding purchaser would not be cheated as is now largely the practise. Purchases could be made with one-tenth the expenditure of time, talent and energy in "shopping" and negotiating, and all consumers would be treated alike and each get a square deal.

It is obvious also that established published prices would be fixed at their proper and legitimate point. A published price would mean the real actual value of the article at which it must sell on its merits in competition with other like products. Competition would be transformed from "sharp and unscrupulous business methods" to the basis of "quality, merit and service."

Ed. Note—The Automobile Journal welcomes correspondence from manufacturers, dealers and owners on subjects of pertinent interest to the industry. Letters should be as brief as possible consistent with the importance of the subject. In publishing these communications The Automobile Journal assumes no responsibility for the opinions expressed.

ADVANTAGES OF LARGE WHEELS.

Some of the Reasons Why Tire and Car Manufacturers Urge Their Adoption.

While the average motorist may be more or less well informed concerning the advantages of large diameter wheels, it is probable that he has given little thought to the reasons therefor. V. A. Longaker, general manager of the American Motors Company, Indianapolis, Ind., has taken up the subject in an interesting manner. He says:

The advantages of large diameter wheels are self-evident. Strange as it may seem, the only question ever raised is the one as to tire cost. The advantages of large diameter tires are so fully appreciated by the tire manufacturers that they are encouraging the use of large diameter tires by making a concession in the price. By referring to a price list of any of the large tire manufacturers it will be found that the price of a 41 by 4.5-inch casing is less than the price of a 36 by five. This hardly seems reasonable to the casual observer. The 41 by 4.5-inch casing must contain a greater amount of rubber and canvas, and certainly it takes a greater length of time to build the body of the tire, owing to the larger diameter. The fact that the difference in the list price is in favor of 41-inch tires can only be explained in that the tire manufacturer is endeavoring to encourage the use of large diameter tires, no doubt reasoning with his own mind that the large wheel is the only solution of the tire problem.

The perfecting of the pneumatic tire has not progressed with the rapid development of the automobile. In fact, the pneumatic tire is the weak point in the construction of the car. Anything which the car manufacturer can do to help overcome the one weak point which has had the greatest retarding effect and the one thing which has been the source of the greatest expense in the maintenance of a car, certainly deserves the attention of the progressive designer.

The theoretical reason why the 41-inch tire has a much longer life than tires of a smaller diameter is that the angle formed by that portion of the circumference of the tire where it makes contact with the road is smaller. As a result, an obstruction in the road of a given height being passed over by the larger wheel, does not cause the wheel to rise so abruptly. In other words, the greater this angle, the more quickly the wheel is called upon to rise. The blow of the contact of this obstruction is consequently greater. Owing to the increased radius of the arc at that portion of the tire which is in contact with the ground, a great many small depressions in the road can be bridged. If the wheel were to drop into these depressions the fall would result in practically the same kind of a blow being applied to the tire as if it were passing over an obstruction which stands above the surface of the road. The greater number of these small, but nevertheless telling, blows that can be overcome will not only prolong the life of the tires, but will also result in the entire mechanism of the car being greatly protected.

Vibration in itself can in a way be compared to a great many blows of greater or less magnitude being applied with greater or less rapidity. The blow of a hammer, for instance, no matter how small it may be, if kept up sufficiently long, will destroy the best piece of armor plate. Vibration is the greatest enemy the motor car of today has to contend with. The large wheels not only lengthen the life of the tires, but prolong the life of the rest of the car as well. In early automobile construction this important factor of vibration was not as fully

Digitized by Google

appreciated as it is at the present time. The early builder found that certain parts of his car were failing. In his early calculations the part may have been designed with the factor of safety in view; however, the all-important question of vibration was overlooked. This problem of vibration has created the demand for the alloyed steels which enter into the construction of the automobile of today to such an extent.

Another reason why the large diameter tire will give a greater mileage is that the length of the chord which is formed by the surface of the road depressing the periphery of the tire is much greater; for instance, a 36-inch tire having a five-inch section, properly inflated, (89 pounds) will have a contact surface in the form of an ellipse approximately 1.75 inches in width by 7.5 inches in length. The area of contact of the 41-inch tire, properly inflated and carrying the same load, is approximately 8.125 by 1.9375 inches. The area of the first contact surface is 10.3 square inches and the second 12.3 square inches, or a gain of 20 per cent.

The increased length of the contact with the road not only has its advantage in the surface wear of the tire, but also plays an important part in the ability of the tire to withstand the enormous strains which are applied in the driving and the retarding of the car to that portion of the tire which is in contact with the ground. The reason for this is that there is a greater percentage of the periphery of the tire which is carrying the load, and owing to the load being applied over a greater portion of the tire, the strain is more equally distributed.

MOTORISTS WERE WASTEFUL.

Vice President Studebaker Thinks Price of Fuel Made Everybody Careless.

That the price of motor fuel rests to a great extent with each individual motorist, and that the industry in general is under a deep obligation to the big oil companies, is the opinion of Clement Studebaker, Jr., first vice president of the Studebaker Corporation, Detroit. He writes as follows:

I have recently noted several articles, quoting automobile manufacturers and others as deprecating the recent increases in the price of gasoline. Some have even professed to see, in the advance, a menace to automobile popularity and industry. As a matter of fact the difference amounts to but a fraction of a cent for each mile a car and should not, in a season's running of 5000 miles, exceed a total of $25. On the other hand, it is high time that motordom should consider the debt it owes the big oil companies, without whose magnificent organization motoring would never have achieved its present popularity.

Before the internal combustion motor, gasoline was virtually a by-product, on sale at central stations for perhaps 10 cents a gallon. The cost of delivery fell on the buyer and often amounted to more than this figure. The oil companies were glad to sell the gasoline at almost any price, for this enabled them to manufacture at a profit, greater quantities of oils, greases and lubricants. While this condition prevailed the buyers of the staples paid a large share of the motorist's fuel bill.

But gasoline motor cars multiplied and eventually the demand for fuel equalled that for the other products. A year or so ago the old balance was reversed. Now the demand for gasoline greatly exceeds that for the staple oils and greases. And in place of the old method of distribution, the oil companies have established a system which covers the entire country, bringing to the very door of each garage a refined product which has often travelled thousands of miles. When one considers the cost of drilling, pumping, transportation, refining and delivering, he must admit that there is no manufactured product sold as cheaply as gasoline. Even at its present price it costs the consumer less than an equal quantity of most brands of spring water.

When the demand for gasoline came to exceed that for the other crude oil products the manufacturers faced a dilemma. They could not produce gasoline and throw away the other products; such a process would have made the fuel prohibitive in cost. To advance the price of gasoline and to lower the price of the other products was the only available means of regaining the balance. So now we pay more for gasoline and less for oils and greases.

As a matter of fact we have all wasted gasoline; it has been so cheap. A little economy will hurt none of us. Automobile manufacturers have built wasteful cars—cars with motors much larger than necessity demanded; cars that lacked efficiency. But the manufacturer is seeing the light. The recent shows emphasized a new tendency—a tendency toward motors that yield more in miles a gallon. But these cars will fail to save gasoline unless their owners do their part.

Just as a wasteful car raises the cost of gasoline, so every motorist who fails to make his car efficient, makes fuel cost more. Owners of automobiles owe it to each other to start a united effort, keeping track of gallon-miles, watching carburetion, learning the art of controlling a car more by the clutch and less by the brakes. A campaign along this line will save enough gasoline to more than balance the recent increase in cost.

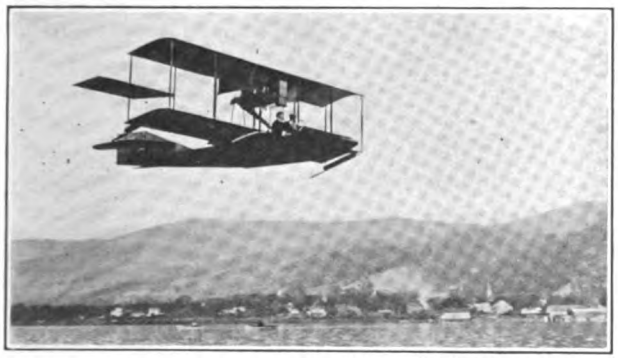
Our office files contain hundreds of letters from tourists whose cars have averaged from 15 to 25 miles a gallon on ordinary country roads, and a car should yield at least 10 miles a gallon in city traffic where there are many more starts and stops. If motorists generally would regard these averages as standard and would strive to exceed them, the condition would be immediately relieved.

The cost of gasoline will advance no further than the necessities of the oil companies' production require. These necessities are, to a large degree, in the hands of motorists themselves.

INTERESTING MILEAGE RECORD.

Pierce-Arrow Covers 22,867 Miles in Europe Without Repair Expense.

A record of 22,867 miles as shown by the speedometer on the car has been reported by Edward Harding, who has returned from Europe after driving the Pierce-Arrow machine owned by Miss M. P. Walker of Boston and made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., in all sections of the Continent. A new 1913 touring car is waiting shipment to Gibraltar, where the party will start on another tour of several thousand miles, this time through Africa.



Mr. Harding reports that in all the 22,867 miles travelled by the 1911 Pierce-Arrow, not a single cent was expended for anything save gasoline, oil and tires. Incidentally, on the entire trip only 18 casings were used, due mainly to the magnificent roads encountered.

Stop, Look and Listen—M. H. Douglass, a locomotive engineer at North Platte, Neb., has prepared a bill for introduction in the present legislature compelling the operator of a motor vehicle to bring the machine to a dead stop before crossing any railroad track or tracks. He states that railroad men all over the country are behind the movement.

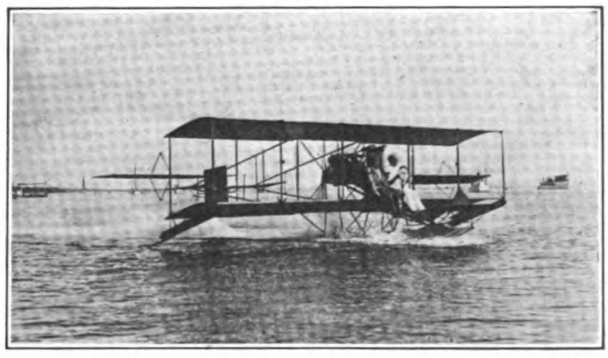
DETAILS OF CURTISS AERIAL YACHT.

AFTER five years the regents of the Smithsonian Institute, Washington, D. C., have made the first award of Langley memorial medals to Glenn H. Curtiss and Gustave Eiffel. These

Curtiss Aerial Yacht in Flight Over Lake Keuka.



medals were provided for in 1908 as a memorial to the late Prof. Samuel Pierpont Langley, a pioneer experimenter in the field of aviation, and at that time the regents decided that they should be awarded only for "specially meritorious investigations in connection with the science of aerodromics and its application to aviation." These two first medals are to be presented May 6, at the annual meeting of the Aero Club of Washington, this date having been selected as Langley Day. The award to Curtiss is made for development of the hydraeroplane, out of which was evolved the flying motor boat or aerial yacht; that to Eiffel, for his recent laboratory work and researches relating to the resistance of the air in connection with aviation.

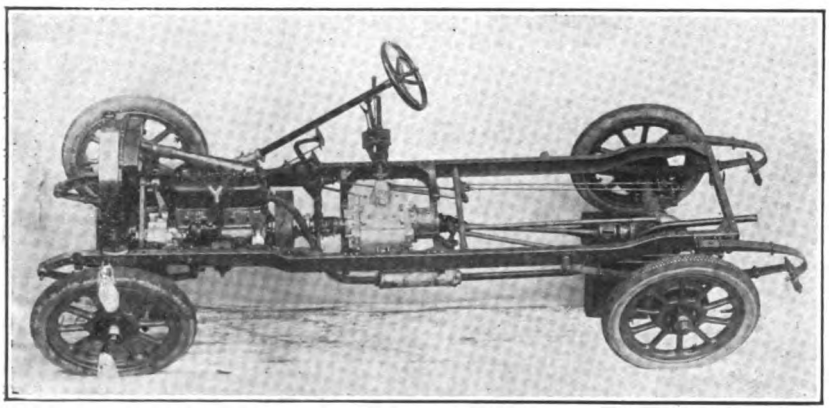
The Curtiss hydraeroplane, which is regarded as the first successful machine of this type, already has been described in full in these columns. The aerial yacht bears a close resemblance to its predecessor in many respects, but is held to be a decided improvement, particularly with reference to the matter of safety. Accompanying illustrations show the machine in flight and on the surface of the water, the photographs having been taken at Lake Keuka, near Hammondsport, N. Y., where the Curtiss plant is located.

The main difference between the hydraeroplane and the aerial yacht, though it may be stated that both are hydraeroplanes in the strict use of the term, lies in the length of the float and the arrangement of the plane surfaces with reference thereto. That is to say, that with the former construction a short float is utilized underneath the main plane formation, and the empenage is free. With the latter the boat body virtually takes the place of the ordinary fuselage.

This boat body practically is an elongated float, the construction being of spruce over a spruce framework with separate water tight compartments. It measures 26 feet in length and 2.5 feet in width at its widest portion, just a little further back than the rear spar. The main plane formation is the regular Curtiss biplane type with a spread of 28 feet three inches. This with its 75 horsepower eight-cylinder Curtiss motor is superimposed upon the float or boat body, directly behind the cockpit, in which the pilot and passengers and controls are located. The engine is mounted rather high, considerably above the axis of the cellule, and drives a left hand propeller eight feet in diameter and six inches pitch.

The empennage does not differ materially from that utilized with the standard Curtiss biplane or the Curtiss hydraeroplane, except that it is mounted over the extreme rear of the boat body. The machine may be flown either with or without a forward elevator, but when one is used the rear elevator works inversely with that at the front, by steel cables which pass through a portion of the boat and in a direct line. The prow of the boat is pointed to offer the least resistance possible when in the water, and the occupants are protected from spray by a collapsible water proof hood. The boat itself is so strongly built that it may be beached with safety, even through a high surf, and is capable of being handled much the same as a fisherman would handle his dory. It may be housed afloat or anchored to a buoy like a motor yacht. Several of these machines have

Curtiss Flying Boat on the Surface of the Water.



been sold in this country and abroad, Louis Paulhan, the pioneer French aviator, having taken the European agency in connection with that for Curtiss hydraeroplanes.

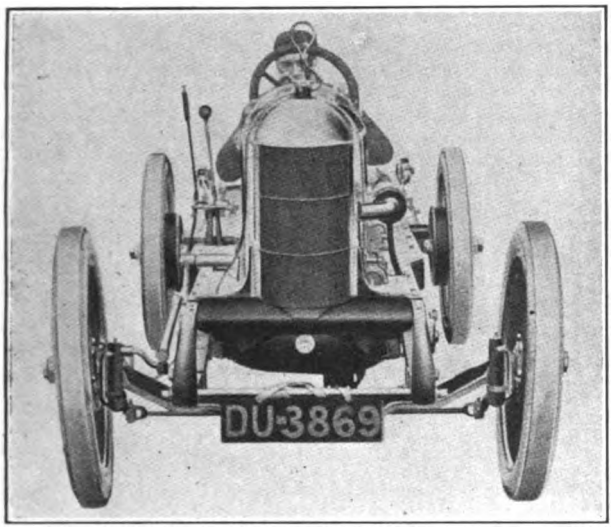
UTILIZES STEEL ARTILLERY WHEELS.

Features of Latest Model of the Singer Produced in Great Britain—American Cars Win in Swedish Ice Carnival Races—Other News Notes from Abroad.

BECAUSE of the very satisfactory manner in which the Singer car has performed in hill climbing contests and events on the Brooklands track, the latest model produced by the Singer Motor Company, Ltd., Coventry, England, cannot fail to be of interest to American motorists, albeit the general construction does not depart greatly from standard practise in this country. It may be added that the machine driven by C. L. E. Geach to create new standard class records (corresponding to stock car records in this country) was rated at 15.9 horsepower, while the new car is rated at 14. It was a 20 horsepower Singer which won the Royal Automobile Club's standard car race in July, 1912, and other events were won with a specially constructed machine, a front

Three-Quarter Top View of 14 Horsepower Singer Chassis, Showing New Block Motor and Other Components.

view of which is presented herewith.



The new model is fitted with a block motor, having bore of 3.07 inches and stroke of 4.92. British engineers contend that it is a particularly neat design. The carburetor is so attached that but a short pipe is required to convey the mixture to the cylinders, the inlet manifold being a part of the integral casting, of course. The exhaust leads are cast inside the water jacket, the outlet being from one union at the rear end. The crankshaft is of particularly large diameter and runs on three exceptionally long white metal bearings. The axis of the Bosch high-tension magneto is parallel to that of the crankshaft, on the exhaust side of the motor. The valves are slightly inclined to reduce the size of the combustion chamber, and with the adjustable tappets having fibre inserts are entirely enclosed by means of easily detachable aluminum covers.

The clutch is of the leather faced cone type, fitted with a series of flat springs secured beneath the back of the clutch leather, providing for smooth engagement. Disengagement is effected by means of two ball bearings, which are stationary and out of action under normal running conditions, and the thrust of the spring is entirely self-contained when the clutch is engaged. The transmission is of the selective type and is suspended at three points in a cradle specially formed by dropping and connecting the cross frame members. Four forward speeds and reverse are provided, with direct drive on the fourth. Perhaps the most interesting feature of all is that of the wheel equipment. These are detachable steel artillery members, and the maker claims they possess double the strength of an ordinary wood artillery wheel of the same weight. No comparison appears to be made with wire wheels, which Americans have come to believe were most generally fitted by British manufacturers. The method of detachment is similar to that in use with wood wheels by a few American makers, although it is stated that it is a special design with this concern. One extra wheel, minus the tire, is furnished.

In view of the wide use of electric lighting systems in this country, it is somewhat surprising to find but few makers fitting this as regular equipment abroad. Undoubtedly the main reason lies in the fact that chassis are sold separately, the body and all other equipment being regarded in an entirely different light than with American producers. The Singer company supplies an electric lighting equipment with this model, but only with the enclosed body types.

In addition to the 14 horsepower model the Singer includes chassis fitted with engines rated at 15, 20 and 25 horsepower, which have not been changed materially for the coming season. The

Front View of Special Singer Racing Model.

steel wheels have been adopted as standard equipment for all.

INCREASE IN GERMAN EXPORTS.

Report of 1912 Shows a Slight Gain in Value of Cars Shipped Abroad.

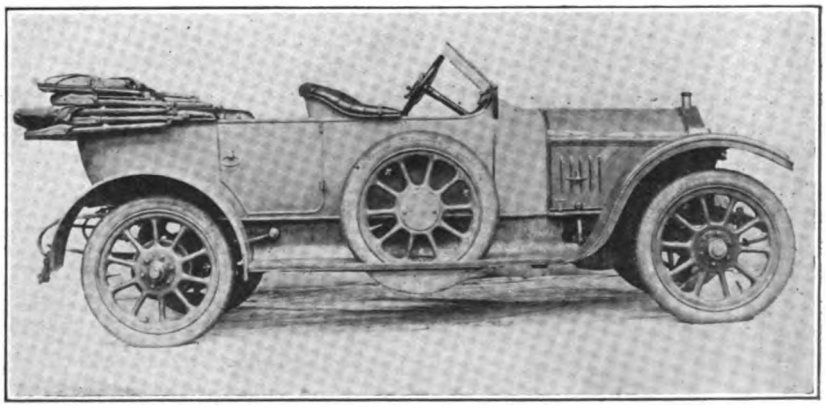
The report of the Association of German Automobile Manufacturers for 1912 shows that the export of automobiles from that country made a gain in value of $5,600,000, compared with an increase of $3,500,000 in 1911. About 6800 pleasure cars were exported in 1912, as against 5136 in 1911, 3399 in 1910, 1838 in 1909, 1151 in 1908 and 958 in 1907. Motor trucks exported in these years numbered 640, 345, 225, 156, 141 and 249, respectively.

Motor vehicle imports increased about $595,000 last year as against $300,000 in 1911. This gain was chiefly in pleasure cars, which numbered 1650 as compared with 1244 for the previous year. While this indicates a considerable sale in Germany by foreign manufacturers, the imports were not as large in number of cars as in 1907, when 1812 were brought in.

The report shows that there was one motor vehicle for each 927 persons in Germany at the close of the year. The total production in the country was valued at approximately $86,000,000.

AUSTRIAN ALPINE TOUR.

Itinerary for the 1913 Test Under Auspices of Imperial Automobile Club.



The Imperial Automobile Club of Austria has decided to hold the 1913 Alpine trials, from Vienna, June 10. The test will occupy nine days and will cover 2610 kilometers (practically 1620 miles) as against 2300 in 1912. It is hoped that a number of American makers will become interested in the event, which is international in character.

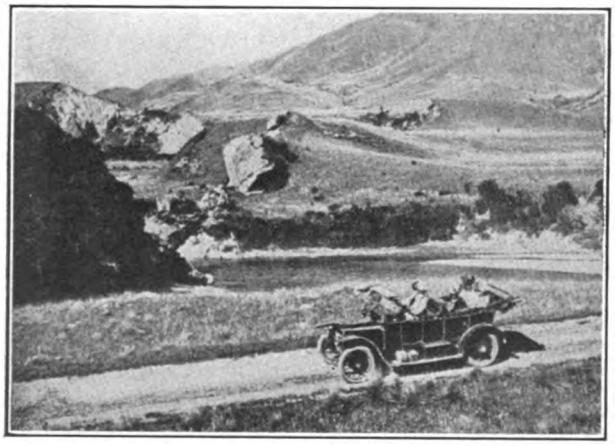
The first day's run will include the beautiful lake district of the Salzkammergut, ending at Salzburg. Then will follow the traversing of the Reshen-Scheideck or Finstermunz pass, and a visit to Innsbruck, while a departure from last year's itinerary will include the road about the Lake of Garde. The three most difficult roads in Austria—Loibl, Tanern and Katschberg—again will form the important features of the contest, as well as the road southward to the shores of the Adriatic at Trieste.

AMERICANS WIN SWEDISH RACES.

Hudson and Cadillac Finish in That Order in Ice Carnival on Lake Malar.

One of the most interesting events in connection with the annual winter ice carnival on Lake Malar, Sweden, early in the month, was the kilometer race from a standing start. Two American cars, a Hudson, made by the Hudson Motor Car Company, Detroit, and a Cadillac, made by the Cadillac Motor Car Company of the same city, finished first and second, defeating a number of foreign machines.

New Four-Cylinder Singer Touring Car, Fitted with Detachable Steel Artillery Wheels.



Digitized by Google

It appears that the race was held on the ice, which was covered with snow practically all of the distance, although occasional glassy surfaces were encountered. The Hudson's time was 0:40, or at a speed approximating 65 miles an hour. The Cadillac finished in 0:45.

MOTORING IN NEW ZEALAND.

Excellent Roads and Beautiful Scenery as Well as Difficult Mountain Ways.

While many people in America have gained the impression that the difficult mountain roads in some portions of New Zealand comprise a fair sample of the ways to be met in these islands, nothing could be further from truth. Long before the advent of automobiles in any large number, several miles of improved highways had been constructed, and both resident and visiting motorists have found these admirable for touring.

Party of Tourists Enjoying Scenic Beauties of New Zealand in a Wolseley Car.

Those who have visited the islands are particularly pleased with the beautiful scenery, holding that it is a combination of the mountains of Switzerland, the lake regions of England and the interesting views of America. An accompanying illustration of a Wolseley car, made in England, gives an excellent impression of one of the scenes for which the islands are famous. Some idea of the road conditions also may be gained.

During the past year or so the number of cars has been increasing rapidly. Both American and British machines are represented. The situation is being fostered by numerous contests held by the Canterbury Automobile Association. The most recent was held over a five-mile course on the beach at New Brighton, near Christchurch.

NOTES FROM FOREIGN LANDS.

A motor volunteer corps has recently been formed in Sofia and is reported to have been in service with the Bulgarian army, transporting officers at the front.

The Wiltshire county council in England has decided to utilize a tar preparation for laying dust on the main roads connecting between 90 and 100 villages of the county during the coming year.

The first Japanese motoring magazine has made its appearance in The Jidosha, which being interpreted is The Autocar. It is a monthly organ, published by the Nippon Automobile Club, and is printed both in Japanese and English.

Austria has decided to impose a tax of 40 cents a day on all motor tourists in that country. Automobiles are permitted to stay three months before becoming subject to annual taxation, while a motorcycle may remain but one month.

Spain has appropriated $10,000,000 for road improvements, and a well defined movement is on foot to interest American and other foreign tourists in visiting that country. Within the past year 37,000 miles of road have been put in condition for motor touring.

The Cadillac Motor Car Company, Detroit, has sold through its Yokahama agent, Andrews & George, five 1913 Cadillac limousines to the Japanese royal family. Two of these were taken by Prince Sanjo, and one each by Count Hijikata, Count Nijo and Count Kanei.

As indicating the increasing popularity of the wire wheel abroad it is pointed out that of the 394 cars and chassis displayed at the recent Brussels Salon no less than 217 were thus equipped. At the 1912 exhibition but 65 of the 308 cars and chassis on display used wire wheels.

Arthur H. Collbran, a wealthy American, engaged in the mining business in Chinnampo, Korea, has purchased a Hudson car, made by the Hudson Motor Car Company, Detroit. This is said to be the seventh automobile in the country and all are of American manufacture.

In view of the increasing demand for Warner Auto-Meters in Great Britain, the Donald F. Johnston Company, sole European agent, has opened a branch at 211 Shaftesbury avenue, London, W. C., where the product of the Warner Instrument Company, Beloit, Wis., will be found in the future.

An interesting suggestion as to the fraternity that exists between the Institute of British Coachbuilders and Society of Motor Manufacturers & Traders in Great Britain, is found in the recent joint banquet held in London. The occasion was one of cementing the alliance between these two industries, and of perfecting plans for combined operation in the future.

During the past year 44 cars, valued at $62,438, were imported into Trinidad, 29 of which, valued at $41,505, came from the United States. Extensive improvements in the road system promise to create an enlarged demand for machines in 1913. The Ford, Herreshoff, Buick, Studebaker and Hupmobile are all well known there and the Overland is just being introduced.

The French government is preparing a bill giving an extra 8,000,000 or 10,000,000 francs to be utilized solely for the maintenance of the principal routes nationales, as the main highways are termed. It is proposed to raise this money by a special tax on automobilists, but the owners throughout the entire country have registered a decided protest on the ground that the present tax is sufficiently high, when it is considered in connection with the duty paid on gasoline and oil.

According to the Manchester Guardian of Manchester, England, one of the noticeable features of the recent North of England show in that city was the very evident tendency of British motor car manufacturers to concentrate their efforts upon the production of fewer models and the construction of a larger number of machines each year. It is understood that one of the largest British makers has announced that it will produce approximately 4000 machines during 1913. This is in marked contrast to previous practise in Great Britain.

NEW YORK SEEKS DETROIT'S PLACE.

Merchants' Association Would Remove Heart of the Industry to Nation's Metropolis—Interest in Fuel Situation—Latest News of the Manufacturers.

SEVERAL cities throughout the country have envied the position held by Detroit in the automobile industry, and during the past year or more chambers of commerce and merchants' associations have been exceedingly busy in an attempt to secure additional motor car factories. Early in the month the industrial bureau of the merchants' association in New York City held an informal dinner at the Hotel Brevoort, at which a number of automobile manufacturers and dealers were present by invitation. The object of the meeting was to discuss fully the possibilities for encouraging the motor car industry to locate in that city.

As a result of this conference, the industrial bureau, of which Henry Morganthau is chairman, has issued an appeal to the industry comparing the advantages offered by Detroit and New York City. In this it is admitted that Detroit now is the predominant centre for the manufacture of automobiles, but the reasons do not appear to be exactly clear to the committee. The statement reads in part as follows:

Advantages Offered by Detroit.

Two or three of the large manufacturers began operations in Detroit, but there seems to have been no special advantages over other cities in the Middle West. Having acquired an early lead in the industry, Detroit became more and more advantageous to the manufacturer on account of the many lines of subsidiary industries which have been built up there, inasmuch as the manufacturing of automobiles is largely becoming a process of assembling.

The labor market in Detroit is said to be excellent, because the mechanics there are largely specialized. During the last two or three years the trend of the automobile market has been westward and now the great consumption of pleasure cars is in the Middle West; hence Detroit is conveniently situated as regards the large market for pleasure cars. Detroit is also near the raw materials. In addition to these many advantages, Detroit offers the automobile manufacturer a liberal banking policy.

Some Disadvantages.

While these advantages are in the main true of Detroit, many of them are passing away because of the very concentration of the single industry there and the points mentioned are becoming positive disadvantages. These disadvantages may be briefly enumerated:

1—The demand for labor is greatly in excess of the supply. A statement has just come, backed by the authority of the employment exchange conducted by the State of Michigan, that the price on common labor will reach 30 cents an hour in Detroit before the end of this year. The demand for every kind of skilled labor, which is so large in the automobile industry, is becoming acute in Detroit.

2—The housing facilities of Detroit are absolutely inadequate to meet the demand and the building operations of the city are not being carried on with sufficient rapidity to offset the increase in population.

3—Detroit has grown so rapidly that it is quite unprepared to cope with its new responsibility. The street car lines, for example, are inadequate and many of the workers in the factories at some distance from the residential section of the city are held up for long periods in the evenings before they are able to get cars.

4—Shortages of freight cars in Detroit which have been in evidence during the past year and up to the present, have proved a great handicap to the automobile manufacturer.

5—While it is true that the banking institutions in Detroit have been on the whole favorable to the automobile industry, the soundness of the financial condition there is questioned by some. The resources of the banks are perhaps too intimately bound up with the automobile industry. Liberal loans to comparatively insecure automobile manufacturers are said to be uncomfortably common, and one or two failures among either the manufacturers or the banks would cause trouble.

6—In short, the very concentration of the industry in Detroit has brought with it serious disadvantages. The automobile industry is in the same situation as the man who put all his eggs in a single basket.

Attractions in New York.

Now, can New York become a great centre for the manufacture of automobiles? Perhaps, to the casual observer New York might not seem to offer many advantages, but to the manufacturer who is carefully studying the situation New York does offer many advantages which are scarcely equalled by any in the Middle West.

Land values in New York—if we mean Manhattan—are pretty high, and it would not be good policy to locate in Manhattan a plant covering large acreage. But in the wide areas in Brooklyn, Queens, Bronx and Richmond land can be purchased and carried almost as cheaply as in any city in the country.

New York City is not distant from the raw materials, either the raw stuffs which go into the automobile, or the manufacturers who make the various parts. Many of the best automobile steels are made in Pennsylvania, near Philadelphia, and many of the most superior parts are manufactured in and about New York—castings, forgings, drop forgings, etc. New York is becoming a greater and greater centre for the manufacture of accessories, which go into the automobile.

Labor Situation and Market.

It is often urged that labor is high in New York. Labor may be somewhat higher than in a small country town, but it is not higher than in many of the automobile manufacturing centres of the Middle West, where the demand for labor has become acute. In addition to this, the supply of labor in New York, both skilled and unskilled, is large and diversified, and the amount of labor which a manufacturer in New York can command at his doors gives him the ability to "pick and choose." The unions are not recognized in the metal trades in New York City.

In addition to these advantages, New York is the centre of a tremendous market. Within 200 miles of New York City there lives almost one-fourth of the total population of the entire United States. Within 400 miles of New York there is almost one-third of the total population of the country, and within a 200-mile radius there is probably one-half of the producing power of the entire United States. Probably not less than 10 to 15 per cent. of all pleasure cars manufactured in the United States are marketed in a territory within 100 miles of New York City.

Financial and Selling Advantages.

The financial advantages of New York are absolutely the best in the country. If the New York banks have seemed somewhat unresponsive to the automobile industries, it is unresponsiveness born of experience. The New York banks are willing to extend credit to the automobile industry on exactly the same conditions and principles as to other industries.

More important, perhaps, than many of these advantages is the possibility of the New York manufacturer's reducing his heavy selling expenses because he can combine under his immediate supervision the manufacturing, selling and service divisions of his business.

Digitized by Google

The advertising value of a location in New York City is of tremendous advantage. It is natural that the citizens of New York should look to the New York manufacturer.

The Export Trade.

The American made automobile is already invading the foreign market and the lowered tariff which is likely to come in the near future will increase our commercial relations with European countries. The New York manufacturer of automobiles will reap the immediate advantages.

New York City offers large natural inducements to the manufacturers of automobiles, even though there may be some disadvantages. It may be that land values and rentals are somewhat higher in New York than in some small western town, but there are advantages on the other hand which compensate. There are acres and acres of comparatively cheap land in the immediate vicinity of New York—in Queens, in Brooklyn, in the Bronx and in Richmond—which will furnish sites for some successful automobile manufacturers who realize the great advantages which the New York market has to offer.

EXPERIMENTS WITH KEROSENE.

Chief Engineer of National Line Has Been Making Exhaustive Fuel Tests.

Among the many motor car manufacturers making experiments with kerosene as fuel is the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars. Chief Engineer William G. Wall has been supervising exhaustive tests for a number of months, and is quoted as saying that in his opinion it will be only a short time before a majority of automobiles will use kerosene instead of gasoline.

Although Mr. Wall holds that there is some question as to the feasibility of starting on kerosene direct and suggests that it may be necessary to use a little gasoline for this purpose, he believes that the electric motor starter will aid greatly in solving the problem. He adds that the disadvantages of the heavier fuel in winter are not too serious to be overcome easily; in fact, he claims to have accomplished this result in his winter experimenting at the National factory.

OFFERS FUEL ECONOMY TROPHY.

Chas. E. Miller Deeply Interested in Holding Contest of This Character.

In view of the present interest in the price and quality of motor fuel, Chas. E. Miller, the pioneer accessory man of 97-103 Reade street, New York City, announces his intention to donate a suitable trophy to be awarded to the car and carburetor which makes the best showing in fuel economy in a series of road tests to be conducted throughout the country. He believes that the award should be made on the basis of ton-miles a gallon, as the final test of efficiency.

Mr. Miller recalls that four years ago, during the automobile carnival in New York City, a fuel economy test was conducted by the local dealers' association under the direction of a committee of engineers. Later a similar event was held by the Automobile Club of Buffalo, utilizing the same set of rules and conditions. He believes that a series of tests of this character will do much to call attention to the economy possible by utilizing the devices now in the market. He says:

"During 1912 automobiles used 12,000,000 barrels of gasoline, which is an increase of 40 per cent. over the previous year. Notwithstanding the increased use of automobiles, if this large consumption of gasoline is not kept down by better mechanical outfits, the price of gasoline must increase. There are a host of good carburetors on the market, some of which are used by the makers of cars and some are not. Many of them, as well as the attachments called 'gas-savers,' really save from 20 to 40 per cent., so that their use more than pays for their extra cost and the expense of changing carburetors. Surely, every user of an automobile is interested in reducing the cost of maintenance, in which gasoline figures so largely."

CASE LEAVES LANSDEN COMPANY.

Succeeded by Blakesley, Giving Rise to an Entirely New Set of Consolidation Rumors.

W. L. Case, vice president and general manager of the Lansden Company, Newark, N. J., maker of Lansden electric vehicles, has resigned his position and his place has been taken by George E. Blakesley. It is understood that Mr. Case has disposed of his holdings in the company and will return to his consulting engineering practise after a trip through the South.

The Lansden Company was established about 10 years ago to develop an electric truck utilizing the Edison nickel iron batteries. After the International Motor Company took over the Mack plants at Allentown, Penn., a number of those interested in the latter business formed a syndicate to buy the Lansden Company, and it was taken over from Edison in January, 1912, when Mr. Case, who had a considerable part in the formation of the International company, was placed in charge.

Mr. Case's resignation would appear to set at rest rumors which have been circulated that the International company was to absorb the Lansden Company. That this supposition is without foundation seems to be further confirmed in the eyes of those interested, by the fact that Mr.

Digitized by Google

Blakesley is said to be closely associated with John M. Mack, who although at one time a strong factor in the International company, has for the past few months been inactive in its management.

There is said to be some prospects of the formation of a new consolidation of the Lansden, the Mack and the Webb companies, all of which are owned by Mr. Mack and his associates. This possibility, however, has to date received no encouragement by those most intimately interested.

QUADRUPLED FORMER OUTPUT.

Annual Reports Show Business of Castle Lamp Company on Satisfactory Basis.

The annual meeting of the stockholders of the Castle Lamp Company, an Ohio corporation with its factory at Battle Creek, Mich., was held recently at Toledo, O., practically all the stock being represented. The reports of the officers were submitted and evidenced an improved condition of the company, the management of which was changed a short time ago. The concern is now a subsidiary of the Willys-Overland interests.

Under the new regime the output has been very much increased, being now four times what it was previously. The directors elected by the stockholders were: E. A. Williams, Jr.; Walter Stewart, Royal R. Scott, Rathbun Fuller and C. B. Mertz, who afterwards held a meeting and elected the following officers: President, E. A. Williams; vice president and treasurer, Walter Stewart; chairman of the board and secretary, Royal R. Scott.

SPONSEL ROTARY VALVE MOTOR.

Company Being Organized to Produce New Design Probably in Detroit.

C. W. Sponsel, formerly superintendent of the General Electric Company's plant in Pittsfield, Mass., is forming a company to be capitalized at $250,000, to manufacture the Sponsel rotary valve motor. Mr. Sponsel is working at present at Racine, Wis., but it is understood that Detroit capitalists are endeavoring to have the company locate in that city.

Mr. Sponsel has worked upon his motor for many years and his first patents were secured in 1903. It is stated that a balanced valve, eliminating about 150 parts found in a poppet valve motor, forms the principle of the new motor. A model is now being made in Detroit.

TO DIRECT BORLAND SALES.

W. C. Little, Well Known Throughout the Industry, Joins Borland-Grannis Company.

Announcement is made by the Borland-Grannis Company, Chicago, of the appointment of William C. Little as sales manager. Mr. Little is well known throughout the industry, through his connection with the sale of both electric and gasoline machines. For several years he was special representative for one of the large manufacturers of electrics, and as such was called upon to take long trips, by reason of which he became well acquainted with a large number of dealers in every section of the United States.

For some time past Mr. Little has been connected with the Lozier Motor Company of Detroit, maker of Lozier gasoline cars. With this concern he was a special representative in the sales department, and it was found that his former experience was of decided value in that position. There appears to be little doubt that in his appointment as sales manager of the Borland-Grannis Company the maker of Borland electrics has secured the services of an exceedingly valuable man.

W. C. Little, Sales Manager, Borland-Grannis Company.

TWO LYONS-KNIGHT CARS.

Models Designed by Concern in Springfield, Mass., to Be Produced in Indianapolis.

The Lyons Atlas Company, Indianapolis, Ind., which owns and controls one of the four American Knight licenses, and which is now manufacturing the Lyons-Knight automobile motors, appears to have absorbed the Atlas Motor Car Company of Springfield, Mass., maker of Atlas pleasure cars. As stated briefly in the last issue, the Indianapolis concern has acquired the

Digitized by Google

sample cars, parts, drawings and patterns of the Atlas cars which were designed, developed and thoroughly tested during the last 18 months by Harry A. Knox of Springfield, one of the American pioneers in the automobile field and president of the Atlas Motor Car Company. Mr. Knox has located at Indianapolis and will have charge of the automobile work at the Lyons Atlas plant.

The Lyons Atlas Company recently purchased the property of the former Atlas Engine Works, which comprises over 65 acres of land, together with 627,000 square feet of factory floor space. James W. Lyons, president of the company, announces that a large part of the plant will be utilized for the manufacture of complete Lyons-Knight four and six-cylinder cars, which will be equipped with worm drive axle, left hand drive, centre control, electric lights, improved electric starter and a large gasoline tank in the dash. The transmission is embodied in the rear axle housing. The best features of the foreign and domestic Knight engines have been incorporated in the Lyons-Knight engines, together with many improved and exclusive features.

BRANCH FACTORY IN SAGINAW.

J. P. Beck Will Produce Automobile Tops and Jiffy Side Curtains.

J. P. Beck of Saginaw, Mich., has secured a branch factory of the Rudd Auto Top Company, Detroit, for the former city, and it will locate in Mr. Beck's new building at Germania and Second streets. The plant is now in operation in charge of E. E. Miner.

In addition to the making of automobile tops of every description, the new factory will also manufacture the new Jiffy side curtain for which Mr. Beck has secured certain rights. The output of the new factory will be considerable.

MAY LOCATE IN THE SOUTH.

Understood That the Maker of the Only Car Has Plans for Removal.

According to information from Charleston, S. C., the Only Motor Company, Port Jefferson, N. Y., maker of Only pleasure cars, will soon transfer its plant to Mt. Pleasant, S. C., where a factory having 25,000 square feet of space will be provided. It is stated that a charter has already been applied for and that negotiations have reached an advanced stage. It is understood that southern capital is interested largely in the Only Motor Company and that the present efforts are being made by the Isle of Palms Traction Company of Charleston.

Meetings of the stockholders have been held and favorable action taken, it is said. M. Rutledge Rivers has been engaged as counsel for the company and has applied for a charter under South Carolina laws, under the name of The Only Automobile Motor Company. It is understood that the principal request of the Only company will be that the town of Mt. Pleasant provide a free site for the factory and this matter is expected to be arranged easily. Rees Hawkins, a stockholder, who has been acting as general manager of the company, has looked the field over and expresses the opinion that nothing would stand in the way of the company's removal to the southern town.

ADDS ANOTHER BUILDING.

Increasing Demand for Hudson Product Creates Need for Larger Production Facilities.

The Hudson Motor Car Company, Detroit, Mich., has added another building, the third within a year, to its 26-acre plant. The combined floor area of the Hudson factory has been made 363,000 square feet by the addition of the new structure, which is 578 feet in length by 90 feet in width.

The building supplants the section of the factory grounds which for some time has been used to accommodate large tents in which work was done because of a lack of room. The output of the Hudson shops has increased steadily and this move was made necessary to care for the additional business.

GARFORD HEADS NEW CONCERN.

Expected That Plant Will Be Located in Toledo for Manufacturing Aluminum Products.

A. L. Garford of Elyria, O., formerly head of the Garford Company of the same city, maker of Garford pleasure cars and trucks, is at the head of a new company recently incorporated with a capitalization of $100,000. With Mr. Garford in the venture are Walter F. Brown, chairman of the Ohio Progressive state committee, and Attorneys Sigmund Sanger and E. C. Froelich of Toledo.

The new concern is known as the Garford Engineering Company and it will probably locate its plant in Toledo. Its purpose is to develop a new

Digitized by Google

process of producing aluminum with the strength of steel in all forms. Mr. Garford sold his control of the Garford Company to the Willys-Overland Company about two years ago, but is understood to have retained a small financial interest in the Elyria plant.

ANOTHER CAR FROM DETROIT.

L. G. Hupp Intrested in the Formation of the Tribune Motor Car Company.

The Tribune Motor Car Company, Detroit, is a new concern which has filed incorporation papers to manufacture a five-passenger, 30 horsepower touring car to sell at a moderate price. Deliveries will begin about May 1 and a deal has already been concluded for a modern factory building to be ready for occupancy in the fall.

At the head of the new concern is Louis G. Hupp and associated with him are several well known Detroit business men. From a modest beginning Mr. Hupp built up a most successful business with the Hupp-Turner Machine Company, the Hupp-James-Geyman Foundry Company and the Hupp-Johnson Forge Company, all of Detroit, he being general manager. The three plants were later merged with the R-C-H Corporation, Detroit, maker of R-C-H cars, of which Mr. Hupp was secretary and treasurer, his brother, R. C. Hupp, being president and general manager. The headquarters of the new company will be located temporarily on Scotten avenue, where the first cars will be built.

TO MAKE ENGINE PARTS.

C. A. Goodspeed Organizes New Concern Which Will Locate in Detroit.

A new factory for the making of automobile engine parts, to cost $20,000 on a $4000 site, is to be built and operated by a new company, the Goodspeed-Detroit Manufacturing Company, Ltd., of Detroit. The concern has a paid in capital of $30,000, and the active head of the firm is C. A. Goodspeed, who is secretary, treasurer and general manager.

He was formerly connected with the Packard and Studebaker companies of Detroit, makers of high grade pleasure cars and trucks of the same names. The site of the new factory is on Harper avenue, opposite the plant of the Regal Motor Car Company, maker of Regal cars. The building will be two stories high and will afford a large floor area.

WITH HOLLY CARBURETOR.

Charles W. Cross Becomes Sales Manager—Concern Is Adding New Buildings.

President George M. Holly of the Holly Bros. Company, Detroit, maker of Holly carburetors, makes public the appointment of Charles W. Cross as sales manager. Mr. Cross has been connected with the industry directly and indirectly for the past 14 years and has a wide circle of friends and acquaintances who will be glad to learn of his latest change.

Soon after graduating from the engineering department of Cornell university he became mechanical engineer for the Diamond Rubber Company, Akron, O., and later joined the executive staff of the Crocker-Wheeler Company as manager of its Detroit office. During recent years Mr. Cross has been associated with the subsidiaries of the General Motors Company and last year he occupied a prominent position in the selling department of the General Motors Truck Company, Pontiac, Mich.

Charles W. Cross, Sales Manager, Holly Bros. Company.

President Holly also announces that additions to the plant are now underway which will enable the company to double its output for the next 12 months. It is understood that the concern has enjoyed a greatly increased business during the past few months, making larger manufacturing facilities decidedly necessary.

Bringing to a fitting close a day at the factory, the Ford Motor Company, Detroit, maker of Ford cars, recently entertained more than 500 branch managers, dealers, bankers and others from Indianapolis, Ind., Columbus, O., and Pittsburg, Penn., at the Hotel Tuller, Detroit. Norval A. Hawkins, sales manager of the company, was toastmaster.

THE REPAIR SHOP AND GARAGE.

Features of the New Air-Friction Carburetor Designed to Utilize Heavy Fuels Mixed with Gasoline---Mending Celluloid and Hard Rubber Articles.

ANNOUNCEMENT is made of a new model by the Air-Friction Carburetor Company, Dayton, O., maker of vaporizers bearing that name. The new design will be known as model B and it is of particular interest in that it is constructed to utilize fuels heavier than gasoline. The company states that of the number in actual use, in some instances two parts kerosene are employed to each part of gasoline, while others utilize half gasoline and half kerosene. The latter combination is recommended by the maker.

A sectional view of the new carburetor is presented in an accompanying illustration and each component is clearly depicted. The use of kero-

New Air-Friction Carburetor, Designed to Employ Heavy Fuels Mixed with Gasoline.

sene is held to be possible by the large wetted surface presented by the spray nozzle A, which retains the mixture between two discs B, .01 inch apart, in a film. The air is taken through one source C, being previously warmed by passing around the exhaust pipe, and being conveyed to the vaporizer by the conventional flexible metal tubing. As the heated atmosphere enters it lifts a truncated valve D, which is enclosed in a valve cage E, this providing the motor a proportionate volume of mixture at all speeds.

As the air passes the spray nozzle A it becomes saturated with the fuel, forming a gas instead of a spray, and is drawn into the cylinders without a vacuum being created. The maker points out that this is superior to a spray full of globules, as the latter are difficult to lift and allow a large percentage of the mixture to condense.

To overcome the difficulties of starting with a heavy fuel a U shaped plunger F is operated by closing the air butterfly valve G, pushing down the valve cage E and its truncated valve D, to restrict the air. This enriches the mixture required for starting. Upon gradually releasing the air butterfly valve G the cage E resumes its normal position. The velocity of the incoming air is dependent upon the throttle opening. The gasoline adjustment is secured by loosening the small winged, thumb jam nut I and rotating the needle T. The adjustment of the air is by the small hexagon nut R.

The bowl and top are constructed of aluminum with the float needle M of brass, tipped with an imported alloy. The float N is of drawn metal. The only spring employed is that at O, it being utilized for pushing the valve in place when the air butterfly member is released, and the small one P is entirely enclosed to prevent tension loss. All levers, nozzle parts, etc., are of brass.

SOME USEFUL CEMENTS.

Articles of celluloid can be mended by preparing a mixture of three parts alcohol and four of ether. The mixture should be kept in a well corked bottle, one having a ground glass stopper being preferred. When celluloid is to be repaired the broken surfaces are painted with the mixture until the material softens. The parts are then pressed together, bound and allowed to stand at least 24 hours.

For hard rubber articles the following formulae are suggested: Dissolve one part of gum camphor in four parts alcohol. Dissolve an equal weight of shellac in such strong camphor solution. The cement is applied warm and the parts must not be disturbed until the cement is hard. Another method is to melt together equal parts of gutta-percha and real asphaltum. The mixture is applied hot and the parts pressed together while cooling.

HORSLEY CONVERTED DISC VALVE MOTOR.

AN INSTANCE of an old poppet valve type of engine being converted into a disc motor is noted in the Horsley disc valve engine, a

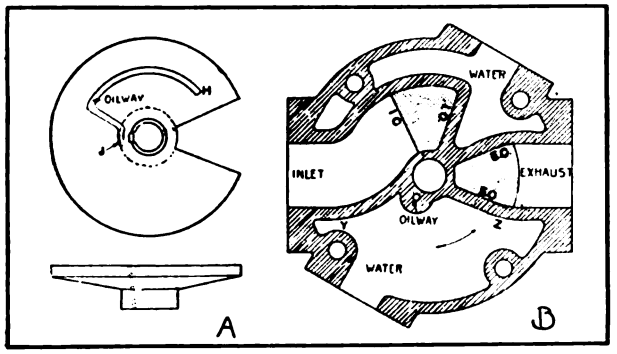

Fig. 1—Horsley Disc Valve Motor: A, Showing Disc Valve and Oilway; B, Section of Valve Chest Illustrating Action of Ports.

description of which appeared in a recent issue of The Autocar, a British motoring print. The design is the product of Horsley & Sons, Ltd., gunmaker of York, England, and it is stated that the bench tests were so satisfactory that the firm has constructed a four-cylinder unit and will place it in a chassis to undergo road tests. The motor has been running for some time in a power boat.

It is claimed to have developed 42.3 horsepower at 1400 revolutions a minute. The bore is 102 mm and stroke 127, or about four by five inches. Particulars of the motor and the valve gear are shown in the accompanying illustrations, and in general design the engine follows conventional practise with the exception of the height, which is somewhat more than usual considering the stroke.

On the top of each cylinder is a separate and removable water-cooled valve chest which carries the valve mechanism as well as the intake and exhaust ports. This is depicted at Fig. 2, also the manner in which it is fitted to the top of the cylinder, forming the head of the combustion space. It comprises a water-cooled body A in which the inlet, exhaust and waterways are formed. The face B is formed in one with the body A, and has a ground under surface, against and under which the valve C rotates. The valve is driven from an overhead chain driven shaft G through skew gearing E, and the vertical shaft D.

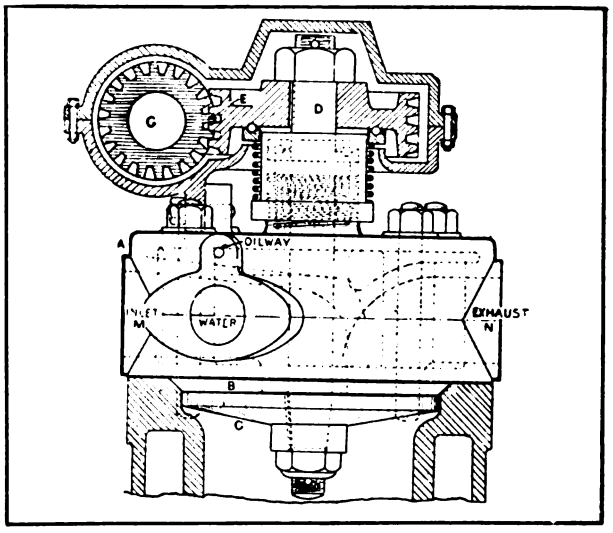
Suitable ball thrust bearings are provided, the valve being kept against the face B by springs shown above the valve chest. The springs being well away from the heat of the combustion are not liable to become weakened by loss of temper.

At Fig. 1 B is shown a section of the valve chest at the line M N in Fig. 2.

The valve runs in the direction indicated by the arrow in Fig. 1 B at half the speed of the motor. The valve has a V cut in it as shown at Fig. 1 A, so that the inlet port begins to open at the point I O and to close at point I C. From points Y to Z neither port is open, and while the valve is travelling between these ports the compression and firing strokes occur. From E O to E C the exhaust is open.

On the face of the valve an oilway is cut, and when the engine is on the suction stroke the part J of the oilway is passing under a duct in the valve chest B, and as the oilway is uncovered at H the suction of the motor draws sufficient oil along the oilway to keep the valve face and seating lubricated.

The motor is lubricated as follows: At the bottom of the crankcase there is cast a sump from which an ordinary pump conveys oil to the five main crankshaft bearings, and also to a distributor or dredger, which normally revolves four times a minute, and passes a quantity of oil to each valve by the respective ducts. There is a return pipe from the dredger to a box on the crankcase, which acts as a filter and also serves the purpose of a filler for the sump. The pistons, cylinders, etc., are lubricated on the splash system.



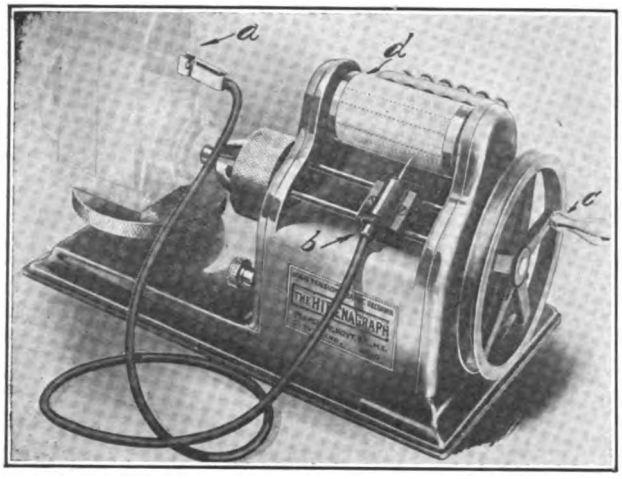


Fig. 2—Part Sectional View of Distributor on Cylinder Head of Horsley Disc Valve Motor.

W. H. Carlson, Jr., in a Benz car, won the recent 200-mile race at Point Loma, Cal. His time was 3:24:28. Three cars finished.

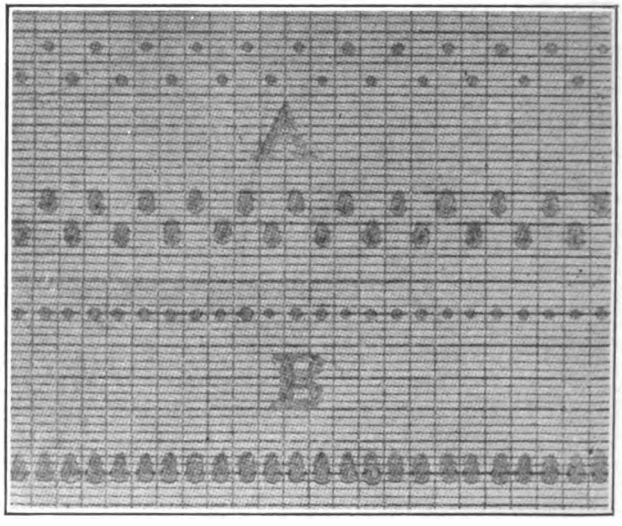
HITENAGRAPH, A DEVICE FOR TESTING IGNITION.

EFFICIENCY with multiple-unit internal combustion motors depends largely upon the synchronization of the spark. A device for testing

The Hitenagraph, Designed for Testing High-Tension Currents, Magnetos, Etc.

and locating faulty operation of ignition systems is the Hitenagraph, announcement of which is made by Francis R. Hoyt of Cleveland, O. The name is derived from its function, that of creating a graphic record of the high-tension or secondary current.



The device is shown in an accompanying illustration testing a magneto for accuracy of performance. The Hitenagraph is simply constructed and its base is provided with a stand for mounting the magneto. The armature shaft of the latter is secured to the driving shaft of the testing device by a coupling similar in construction to the chuck of a drilling machine. The connection is so designed that the tapered shaft of the magneto may be held securely.

Rotating the driving wheel C revolves the armature of the magneto. The wheel is fitted with a handle, although its periphery has a V groove, permitting drive by a belt if desired. The drive is direct, there being no reduction. The chart drum revolves at an increased speed and the design is such that the spark index b which travels (through connection with a worm) longitudinally across the drum, is always diametrically adjacent, at the time the discharge should occur, to the ordinate on the chart itself on which the last produced spark registered. In this manner is shown, by the alignment of the sparks on the chart, the relative timing or synchronism of each cylinder, also the intensity of the spark by the area effected by it on the chemically prepared chart.

Two sections of the chart are reproduced herein, that marked A illustrating a typical case of lack of synchronism. The lines across the chart represent degrees of crankshaft rotation, or in other words, the chart as attached to the drum, is divided into 180 degrees and travels twice as fast as the magneto being tested. Each time the latter produces a spark, which is ordinarily twice a revolution or 180 degrees apart, the chart makes a complete revolution and each succeeding spark should fall on the same line of the chart as the one preceding it. In the illustration at A the record shows that the magneto is five degrees out of time. The difference in the size of the spark at retard and advance, is also indicated. At B is presented a record of the same magneto after being repaired and adjusted.

The Hitenagraph may be utilized for testing a magneto without removing the latter from the car, a smaller model being manufactured especially for garage service. The larger or bench model is for use in factories and it is stated that it will test 20 machines an hour. This latter design is equipped with a variable speed device, and a tachometer giving graphically the revolutions a minute.

At the recent third annual automobile show

Chemically Prepared Chart Recording Lack of Synchronization at A and Proper Timing at B.

in Elmira, N. Y., held by the Elmira Automobile Club, the dealers sold cars to the value of $85,000 during the week.

GARAGE AND REPAIR SHOP EQUIPMENT.

DETECTORPHONE.

An instrument for locating mysterious knocks or noises by an adaption of the microphone principle is being produced by the Boston Talking Machine Company, 41 West street, Boston. The device comprises a receiver, similar to that employed by telephone operators, and the phone member. The latter is provided with a microphone button, changing the position of which is held to magnify the sound through the vibration travelling up the rod through the button, thence to the receiver and the ear.

J. M. MOBILENE PACKING.

The H. W. Johns-Manville Company, New York City, is marketing the J-M mobilene sheet packing which is designed for service where extremely high temperatures are encountered, such as at the exhaust manifold, etc. The packing is constructed of asbestos with fine brass wires intertwisted in each strand. It does not burn or char and one side is graphited. It is pliable, easy to cut, and being compressible makes for a tight joint. It comes in rolls 40 inches wide and .03125 thick.

HARDY RATCHET WRENCH.

A wrench operating upon the ratchet principle is the Hardy, being marketed by the Hardy Manufacturing Company, Pendleton, O. It is an all steel tool having five parts, these comprising a handle, two side plates, a ratchet socket and a rivet. The latter is employed to secure the side plates to the handle.

FISHER QUICK ACTING VISE.

Fisher & Norris, Trenton, N. J., is manufacturing what is known as the Fisher quick acting lever vise. It is constructed of gun metal with a solid bar and all parts are interchangeable. The work is inserted in the jaws and held securely by a forward movement of the lever. The part cannot be removed until the lever is pushed back. The jaws are faced with steel, file-cut and properly tempered.

FORMULAE AND USEFUL MECHANICAL TABLES.

Use of Water on Cutting Tool.

With the best high speed steel tools a gain of 16 per cent in cutting speed can be made in cutting cast iron, steel or wrought iron by throwing a heavy stream of water directly on the chip at the point where it is being removed from the forging by the tool. Not less than three gallons a minute should be used for a two by 2.5-inch tool. The gain is practically the same for all qualities of steel, regardless of hardness and whether thick or thin chips are being cut.

Lubricant for Milling Cutters.

An excellent lubricant for milling cutters when used with a pump is made by mixing together and boiling for one-half hour, one-quarter pound sal soda, one-half pint lard oil, one-half pint soft soap and water enough to make 10 quarts.

Grades of Emery.

The numbers representing the grades of emery run from eight to 120, and the degree of smoothness of surface they leave may be compared to that left by files as follows: Eight and 10, represent the cut of a wood rasp; 16 and 20, represent the cut of a coarse rough; 24 and 30, represent an ordinary rough; 36 and 40, bastard; 46 and 60, a second cut; 70 and 80, smooth; 90 and 100, a superfine; 120 F and FF, a dead smooth file.

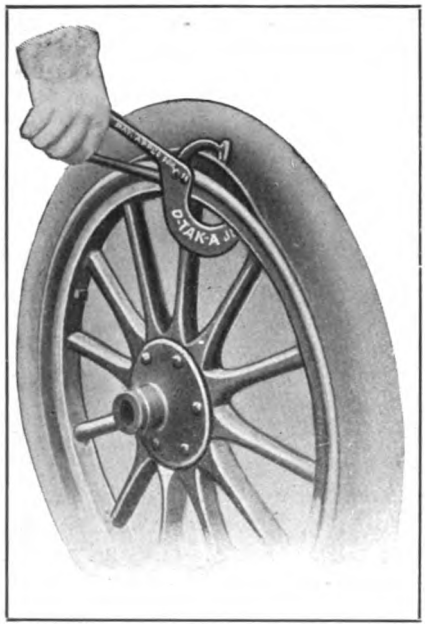
Patching Cement.

A cement for patching rubber boots and which will unite leather to leather, India rubber, etc., may be made by taking 100 parts of finely chopped India rubber, 15 parts rosin and 10 parts shellac, and dissolving in carbon disulphide. The vessel in which the solution is made should be kept tightly closed and should be shaken from time to time. Carbon disulphide is highly volatile and should not be exposed to a naked flame.

S. A. E. Horsepower Formula.

The standard formula for the rating of gasoline engines used in automobiles in this country is that adopted by the Society of Automobile Engineers, in which the bore is squared, multiplied by the number of cylinders and divided by 2.5.

The following table will be found to be of service in ascertaining the S. A. E. horsepower of four and six-cylinder motors, the bore being given in both inches and millimeters:



Bore		Horsepower	
Inches	Millimeters	Four-Cylinder	Six-Cylinder
2.500	64	10.000	15.0000
2.625	68	11.000	16.5000
2.750	70	12.100	18.2000
2.875	73	13.250	19.8750
3.000	76	14.400	21.6000
3.125	79	15.625	23.4375
3.250	83	16.900	25.4000
3.375	85	18.250	27.4000
3.500	89	19.600	29.4000
3.625	92	20.250	31.6000
3.750	95	22.500	33.7500
3.875	99	24.000	36.0625
4.000	102	25.600	38.4000
4.125	105	27.250	40.9000
4.250	108	28.900	43.8000
4.375	111	30.625	45.9375
4.500	114	32.400	48.6000
4.625	118	34.350	51.6000
4.750	121	36.100	54.1000
4.875	124	38.000	57.0000
5.000	127	40.000	60.0000
5.125	130	42.000	63.0000
5.250	133	44.100	66.2000
5.375	137	46.000	69.1000
5.500	140	48.400	72.6000
5.625	143	50.625	75.9375
5.750	146	53.000	79.5000
5.875	149	55.250	82.9000

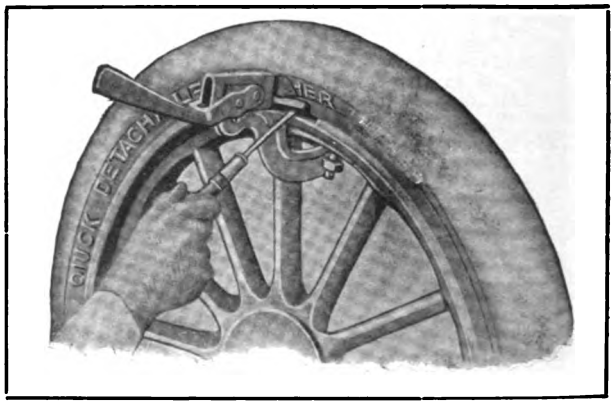
O-TAK-A TIRE REMOVERS.

Regular Tool Is Supplemented by a Junior Adapted for Cars with Clincher Tires.

Announcement is made by J. W. Grumiaux, sales agent, Le Roy, N. Y., of the O-Tak-A Junior, a special tool for removing clincher shoes, designed and specially adapted for Ford, Metz and Brush cars. It is suited for all clincher shoes and the principle is identical to that employed on the O-Tak-A tire tool. It will loosen a clincher shoe from the rim and push it back far enough so that the bead may be pried out easily. As will be noted by an accompanying illustration the tool is equipped with two tong like extremities having handles which when brought together exert such pressure that it is a simple matter to overcome the resistance of the shoe even when badly rusted to the rim.

Showing the Application of O-Tak-A Junior to a Clincher Tire.



A feature of the design is that one tong fits the inside rim while the other has a projection so designed that when pressure is applied the bead is forced slightly downward and back. This prevents the tool slipping and at the same time energy is applied to the bead and not the walls of the casing. After the contact between the bead and rim is broken a further movement of the tool carries the shoe up and away from the rim, making it an easy matter to remove it. The O-Tak-A Junior is not only inexpensive, but it will not injure the paint, and being compact may be easily stored in the tool box. The method of applying the device is shown in an accompanying illustration.

The O-Tak-A differs from the Junior in that it is adapted to quick detachable and demountable rims. It may also be employed for large clincher tires, a small attachment being slipped over the nose of the plunger converting the tool into one suitable for this work. The large design is made in two sizes, the No. 1 fitting tires up to and including four inches and the No. 2 four inches and over.

The tool in service is shown in an accompanying illustration and it will be seen that the nose of the plunger passes over the locking ring of the tire and acts at right angles to the plane of the wheel. The tool locks at its extreme inthrow, being set so as to hold the inner ring just back of the flange of the locking ring, permitting easy removal of the latter and the tire. As it locks automatically the operator has both hands free to handle the shoe and locking ring. The yoke carries an extension which comes in contact with the under side of the rim extending beyond the felloe. This acts as a shoulder and prevents the tool from slipping.

A quality of the device is that tires may be removed from demountable rims easily and quickly either on the car or in the garage, a task usually involving considerable labor, especially some types of rims that require considerable pressure. The O-Tak-A, either large or small, is constructed of high grade material and is guaranteed to perform the work claimed of it. It is finished in aluminum or nickel.

John Muir of Beith, Scotland, recently addressed the Hoosier Motor Club, Indianapolis, Ind., on the subject of the "shock shifter" hub, which is his invention. This device is composed of a hub loosely filled with steel balls, which by constantly shifting their position, Mr. Muir claims, reduce the vibration resulting from road shock to a minimum.

Illustrating Use of O-Tak-A Tire Tool—Showing Tool Automatically Locked and Operator Free to Use Both Hands.

IN THE REALM OF THE MOTORCYCLIST.

The Boston Show and the Men and Machines Seen There---Some Recent Developments in Winter Riding---News of the Manufacturer and the Dealer.

IT IS more or less well known that the Motorcycle Manufacturers' Association no longer exhibits as such at the annual Boston show. This decision was reached just previous to the display of 1912. As an automobile exhibition this always has been a dealer's proposition, so that it may not occasion surprise to find that such motorcycles as are to be seen there are shown by dealers. However, the reputation of the Boston show as a business producer ought to hold good for motorcycles as well as automobiles, and the experience of those who made display this year appears to have borne out this assumption.

There were only five dealers represented, with a total of 10 different makes. In view of the importance of New England as a market for the two-wheeled mount it would seem that the manufacturers should have made more effort to see that their lines were on display. Not all of the exhibitors were local dealers, some being territorial distributors, and in almost every instance some one from the factory was present to see that all sales were properly closed.

The machines were displayed in the basement, and it is well known that this portion of Mechanics' building does not respond readily to decorative treatment. However, those who were desirous of inspecting the models presented had abundant opportunity, albeit the exhibitors were not located together as at New York or Chicago.

A Glimpse of the Motorcycle Display at the Recent Boston Show, with Merkel Machines in the Foreground.

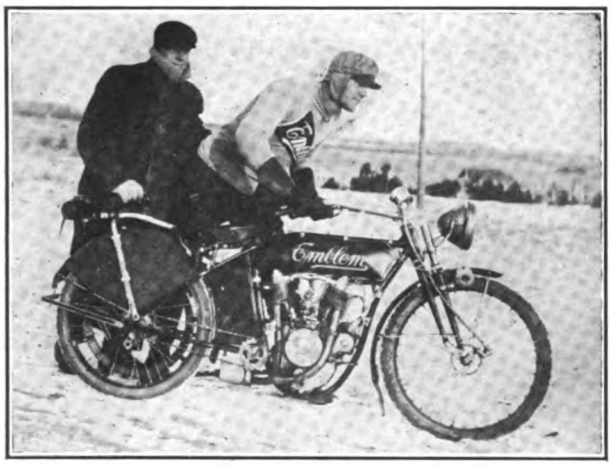
Boyd, the Merkel Man.

The Boyd Motor Company, 27 Stanhope street, had a very comprehensive display of Flying Merkel machines, made by the Miami Cycle & Manufacturing Company, Middletown, O. This included one of the first spring frame machines, now 12 years old. There was decided contrast between the Merkel of 1901 and the Yellow Jacket, self-starting Flying Merkel of 1913, which stood beside it on the floor. And then there was R. C. Boyd's winter motorcycle, concerning which more is to be said later. This proved the centre of attraction and gave Mr. Boyd the necessary opportunity to seek out those who were interested in possessing a machine. C. A. Van Doren represented the factory during the week.

Emblem, Eagle and De Luxe.

This company also has the agency for the Emblem, made by the Emblem Manufacturing Company, Angola, N. Y.; the Eagle, made by the American Motor Company, Brockton, Mass., and the De Luxe, made by the Excelsior Cycle Company, Chicago. The Emblem was not shown, but the other two were well represented. L. B. Marsh and C. E. Crout of the American company were on hand to assist Mr. Boyd.

Grady Handles Three Lines.



J. W. Grady & Co., Worcester, Mass., had three makes on display, comprising the Dayton, made by the Davis Sewing Machine Company, Dayton, O.; the Henderson, made by the Henderson Motorcycle Company, Detroit, and the Excelsior, made by the Excelsior Motor Manufacturing & Supply Company, Chicago.

Harley-Davidson and Pope.

The New England Motorcycle Company, 178 Columbus avenue, presented two lines—the Harley-Davidson, made by the Harley-Davidson Motor Company, Milwaukee, Wis., and the Pope,

Digitized by Google

made by the Pope Manufacturing Company, Hartford, Conn. W. J. Walker of Danvers, Mass., New England branch manager for the

E. T. Swenson and F. L. Gladd of Des Moines with the Former's Emblem Mount.

Harley, was busy throughout the week signing up local dealers as well as assisting in the closing of sales. D. G. Ryan represented the Pope factory.

The Yale Display.

J. W. Kilham, Beverly, Mass., displayed the Yale line, made by the Consolidated Manufacturing Company, Toledo, O. O. W. Fuller, New England representative of the maker, also took occasion to close up a number of agencies, among which was the Combination Ladder Company, Providence, R. I., as distributor for that state.

Holden Demonstrates Indian.

George N. Holden, 188 Massachusetts avenue, had a very comprehensive line of Indian machines, made by the Hendee Manufacturing Company, Springfield, Mass. Of course, the new Indian sidecar also was exhibited, and with the exception of the Baxter sidecar, made by the Baxter Side Car Company, Cambridge, Mass., fitted to one of the Flying Merkels at the Boyd Company's display, was the only representative of this equipment in the show. J. P. McDowell of the Hendee factory assisted Mr. Holden throughout the week.

Satisfied with the Emblem.

An accompanying illustration presents E. T. Swenson of Des Moines, Ia., and his Emblem mount, which is supplied with a tandem attachment, preparing for an afternoon's ride with his friend, F. L. Gladd. Swenson is particularly pleased with the sturdy construction of the machine and has found it equal to every demand he has made of it, albeit the road conditions in Iowa are not always of the best. The machine is made by the Emblem Manufacturing Company, Angola, N. Y.

Shipping Sidecars Abroad.

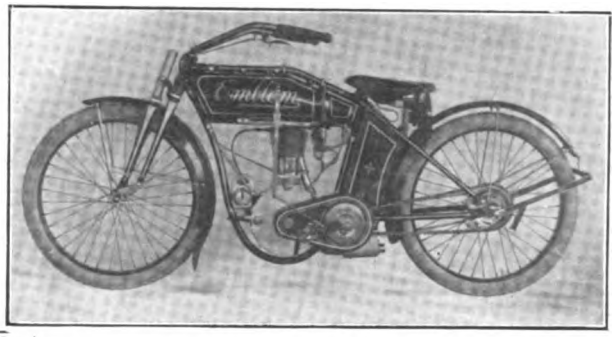
The Majestic Manufacturing Company, Worcester, Mass., reports that the export of sidecars for motorcycles is gaining considerably and recent shipments have been made to South and Central America and to the Hawaiian and Philippine Islands. There is a steadily increasing sale in Cuba and Porto Rico and inquiries are constantly being received from Sweden, France, Austria, India and Japan.

To Select Convention Seat.

The board of directors of the Federation of American Motorcyclists will hold a special business session at the Auditorium Annex Hotel, Chicago, Thursday, April 3. Director Sauer will attend after completing his trip to the Pacific Coast and the board will act on a great deal of business in connection with his trip. The place of the location of the 1913 convention will probably also be determined.

With the Yale in Maine.

An accompanying illustration presents O. W. Fuller, New England travelling representative of the Consolidated Manufacturing Company, Toledo, O., on his Yale mount in Waterville, Me., Feb. 13, with the thermometer at 15 degrees below zero. Mr. Fuller declares that it has been as cold as that this winter—down in Maine. He rode this machine throughout the entire district, and he claims to be certain as to the weather



O. W. Fuller and His Yale, with the Thermometer at 15 Degrees Below Zero, in Waterville, Me.

conditions in that section. Incidentally, it may be remarked that the Yale did not fail to perform its function despite the low temperature.

Volunteer Motorcycle Patrol.

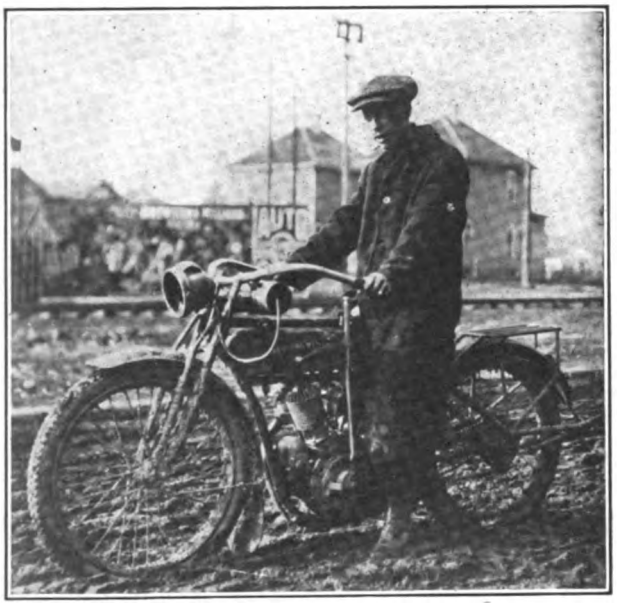
A plan has been formulated by P. E. Zimmerman, secretary of the Kansas Short Grass Motorcycle Club, on the advice of President Patterson of the F. A. M., for a volunteer state patrol of motorcycle riders to be organized to operate against thieves and robbers. The plan has been submitted to Gov. Hodges of Kansas. The idea to be followed out, according to Mr. Zimmerman's suggestion, is that a patrol be operated along similar lines to the Texas Rangers, save that they would be mounted on motorcycles instead of horses.

New Registered Repair Shops.

Following are new repair shops registered with the F. A. M.: Badger State Motorcycle Company, 858 23d street, Milwaukee, Wis.; Clark Cycle Company, 607 Broad street, St. Joseph, Mich.; Lents Garage, Lents, Ore.; G. S. Wilson, Bechtelsville, Penn.; D. W. Polkinhorn, Cherokee, Ia.; Guarantee Electric Company, Ltd., 1531 Canal street, New Orleans, La.; Roy R. Baer, 5 West Fourth street, Sterling, Ill.; Gerber & Winter, 688 St. Peter street, St. Paul, Minn.; Roy W. Brown, 195 Burnside street, Portland, Ore.; T. H. Smith, 605 Dale avenue, Roanoke, Va.; East Side Motorcycle Company, 41 Grand avenue, Portland, Ore.; Bicycle Garage, 210 Madison street, Tampa, Fla.; W. W. Smith & Sons, 518 Lincoln avenue, Clay Center, Kan.; Duersch Cycle Company, Hamilton, O.; General Repair Shop, 209 North 28th street, Billings, Mont.

Dr. G. B. Gibson, Westboro, Mass., secretary of the F. A. M., has issued a notice that the copy for the forthcoming booklet of registered motorcycle repair shops will close April 1. There probably will not be another complete compilation until the spring of 1914, as only a supplement of similar data will be issued Sept. 1, this year.

Bi-Car in Canadian Plant.



Brantford Autocycles, Ltd., has been formed at Brantford, Ont., for the purpose of manufacturing an improved Bi-Car, having acquired the rights and patents of the Detroit Bi-Car Company, organized at Detroit in 1911. The company has been incorporated under Canadian laws with a capital of $200,000. The officers are: President and managing director, H. B. Rowell; vice president, John Schultz; secretary and treasurer, T. L. Wood. These officers and George K. Wedlake and John Spence form the board of directors. R. B. Hawkins is factory manager and Taylor & Neuteboon of Detroit is consulting engineer.

Cross Country Winter Trip.

Covering 338 miles in 15:10:00 on a seven horsepower, 1913 chain driven Flying Merkel, Herbert H. Huntsberry, assistant sales manager for I. H. Silsby, Cleveland, O., northern Ohio distributor for this make, believes he created a new record for midwinter riding recently. An accompanying illustration shows the machine and rider at the completion of the trip.

Huntsberry left Cleveland for the factory of the Miami Cycle & Manufacturing Company in Middletown, O., going through Elyria, Oberlin, Norwalk, Bucyrus, Marion, Columbus, Springfield and Dayton. On the first day he encountered plenty of snow and ice; the former in places being from four to six inches deep. From Bucyrus to Marion the roads were terribly muddy, although fair riding conditions prevailed between the latter city and Columbus.

H. H. Huntsberry of Cleveland, O., and His Flying Merkel at the Completion of Recent Midwinter Run.

The sole object of the trip was to ascertain how the new Flying Merkel would withstand severe winter riding. The only damage to the machine resulted from a slide on some ice near Bucyrus, where a pedal was broken. The total amount of gasoline used was five gallons, an average of 67.6 miles to the gallon, while two quarts of oil was sufficient, giving an average of 169 miles to the quart.

Baker Surprises Cubans.

E. G. Baker, the well known Indianapolis rider, is enjoying a tour of the West Indies, Panama and southwestern United States, and while in Cuba found that his mount attracted much attention. In many of the small towns in the interior a motorcycle had never been seen and the natives could scarcely believe it possible that a person could travel so fast upon one. Baker is the first man to ride entirely across the island, the roads a large part of the way being mostly in the nature of cow paths.

Three Stolen Machines.

Information concerning the following stolen motorcycles would be appreciated: H. K. McCotter, Flying Merkel, 1911 model, six horsepower twin, V type, factory No. 3988, carried Michigan license 2185 when stolen (report to Miami Cycle & Manufacturing Company, Middletown, O.); A. T. Merrick, 32 Union square, New York City, Indian, 1911 model, five horsepower twin, manufacturer's number, 20 C 087; C. E. Stauffer, 414 47th street, Brooklyn, N. Y., Indian, 1912 model, seven horsepower twin, manufacturer's number, 70 D 228.

Hedstrom Retires from Office.

Oscar Hedstrom, vice president and mechanical engineer of the Hendee Manufacturing Company, maker of Indian motorcycles at Springfield, Mass., has resigned, although he retains a financial interest in the concern. This action comes as distinct surprise to the trade. He announces that he will take a vacation and has no plans for the future.

Mr. Hedstrom is looked upon as the founder of the motorcycle industry in America. It was he who imported several of the motor driven machines from France, where they had been used to pace bicycle riders in races. Finding the motors crude he perfected them until they became in large demand for this purpose in this country. George M. Hendee, then identified with bicycle racing, suggested that the motorcycles could be made for road use and Mr. Hedstrom experimented and perfected the invention at Middletown, Conn. Since that time he has been vice president and mechanical engineer of the Hendee company.

Recently Appointed Commissioners.

The following local commissioners have been appointed by the state commissioners: T. D. Shumate, traffic department, N. & W. Railway, Roanoke, Va.; G. H. Tompkins, 311 West Broad street, Richmond, Va.; J. F. S. Duke, 546 Park street, Charlotteville, Va.; William F. Stembler, Jessups, Md.; A. E. Midgley, Menlo Park, Cal.; R. J. Kreirauck, Niles, Cal.; R. E. Adelmeyer, Sierra Madre, Cal.; W. M. Smith, Brawley, Cal.; William G. Baker, New Windsor, Md.

Boyd's Winter Motorcycle.

Those who visited the Boston show did not fail to become interested in R. C. Boyd's winter

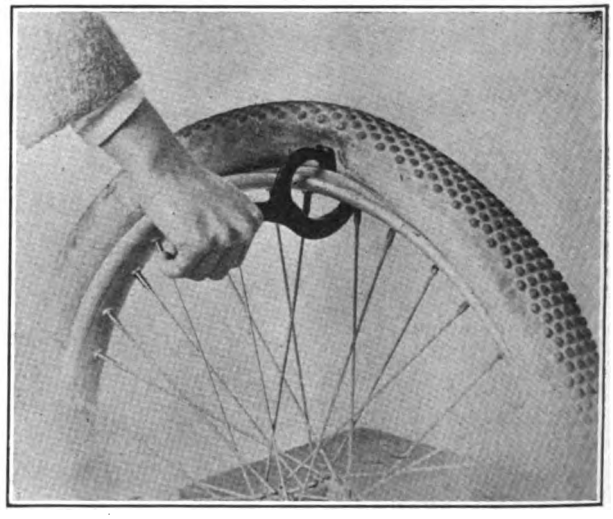
R. C. Boyd's Idea of a Practical Winter Motorcycle.

motorcycle, which is shown in an accompanying illustration in operation upon the road. This device, which resembles a submarine boat in outward appearance, occupied the centre of the Flying Merkel booth, and a large portion of the time during the show Mr. Boyd received his visitors from a seat in the forward end.

It appears that some months ago Mr. Boyd was injured in an automobile accident. Usually he is the moving spirit in the Boyd Motor Company at 27 Stanhope street, Boston, where he is a decidedly active salesman in the interest of Merkel machines. For weeks after the accident he was unable to leave his bed, but as soon as he was able to sit up a little his thoughts turned toward his favorite mount.

As a result of his dreaming, if such it may be termed, a tricar was attached to one of the latest two-speed models and over and around this was fitted a sheet iron covering, painted yellow. This covering is conical in shape and comes to a point at both front and rear. In the forward end a bright headlight has been fitted, and a short distance above this, like two eyes, are two side lights, one red and the other green. At the point in the rear is a red tail light, and below this is the number plate, complying with the Massachusetts law in every particular. Painted on the after deck is the name, "Yellow Jacket." The mudguards are in the shape of fins and a small gangway offers an easy means of entrance and egress.

That the arrangement is thoroughly practical is borne out by the fact that it was used by Mr. Boyd during his convalescence, and throughout the winter. As may be seen, the occupants are almost completely protected from the weather, only their heads appearing above the metal covering. And it is claimed that the shape of the body is such that it adds to rather than diminishes the speed of the machine.



Legless Rider on Minneapolis.

Alfred Leroy of Los Angeles, Cal., recently made a motorcycle trip from that city to San Francisco, Cal., in three days. Mr. Leroy has no legs and but one good arm, but he has a side car attachment which enables him to work the levers with this, while he steers with the stump of his other arm. He rode a Minneapolis motorcycle, made by the Minneapolis Motor Company, Minneapolis, Minn.

O-Tak-A Tire Remover.

Among the new accessories for motorcycles revealed at the Boston show was the special motorcycle O-Tak-A tire remover, marketed by J. W. Grumiaux, sales agent, Leroy, N. Y. This concern makes three sizes of tools, two of which are designed for automobile use. The motorcycle device is the smallest of the three and is designed to loosen a clincher tire from the rim and push it back so that the bead can be pried out over the clinch. The operation is decidedly simple.

The tool is shaped somewhat like a pair of tongs, having two handles, designed to give full control so that it may be held in the most advantageous manner to overcome the resistance of the tire. As indicated in the accompanying illustration, the hand grasps the two handles and one end of the remover is inserted between the spokes until it hooks onto the rim on the opposite side

Illustrating Method of Using O-Tak-A Motorcycle Tire Remover.

from that at which the operator is working. The "nose" on the other end is pressed firmly against the bead, and it is maintained that the construc-

Digitized by Google

tion is such that it will not slip even when the tire has become rusted or frozen to the rim. After the bead has been loosened the tool can be raised, thus throwing the tire up and away from the rim, permitting easy removal. It will be noted that the tool does not come in contact with the spokes or felloe.

American Machines Race in India.

Two American machines competed in the recent Tourist Trophy race of 297 miles in India. A. Lee rode a 3.75 horsepower Indian, made by the Hendee Manufacturing Company, Springfield, Mass., and finished second after suffering a fall which broke a foot rest on his machine. He rode most of the distance with one foot on the frame and averaged 35 miles an hour. T. Cameron was mounted on a three horsepower Pope, made by the Pope Manufacturing Company, Hartford, Conn., and after running out of gasoline 20 miles from the finish, he walked 14 miles before being overtaken by another rider, who loaned him his emergency supply of gasoline, permitting him to finish eighth.

Thor Maker to Move.

It is announced that arrangements practically have been completed for moving the motorcycle plant of the Aurora Automatic Machinery Company, maker of Thor motorcycles, from Aurora, Ill., to Chicago. It is stated, however, that only the motorcycle plant is to be moved, as that part of the company's business has grown to such proportions that more room has become necessary to expand the output. The building to be leased at Chicago has been decided upon, the only remaining thing being the signing of the lease, which is expected to take place in a short time.

Club Notes, Here and There.

The Bay State Motorcycle Club has been organized at Boston with 75 charter members. Quarters have been taken at 325 Columbus avenue, and the club has affiliated with the F. A. M. The officers elected are: President, G. J. Downs; vice president, F. H. Hart; secretary, H. J. Stearns; treasurer, D. E. DeLong.

A climb to the top of Mt. Hamilton was enjoyed recently by the members of the San Jose Motorcycle Club, San Jose, Cal.

A campaign for new members is being conducted by the St. Joseph Motorcycle Club, St. Joseph, Mo., and it is hoped to increase the membership to at least 75.

A membership campaign conducted by the Aberdeen Motorcycle Club, Aberdeen, S. D., resulted in the addition of 92 names to the club roster.

The Salt Lake City Motorcycle Club, Salt Lake City, Utah, held a big celebration St. Patrick's Day. Early in the evening there was a motorcycle parade, headed by the city's motorcycle policemen. A dance in the club rooms followed. The club has also made arrangements for a carnival for Memorial Day and later a hill climb will be held.

Indianapolis, St. Paul, Minneapolis and Kansas City are being considered as the sixth city of the American League of Professional Motorcycle Racing Clubs, which already includes Cleveland, Chicago, St. Louis, Cincinnati and Detroit.

A Decoration Day endurance run is being planned by the New Jersey Motorcycle Club of Newark, N. J., which promises to furnish one of the most severe tests of rider and machine that has yet been undertaken by the Newark organization. The run will cover about 427 miles through the surrounding hills and mountains and will occupy a period of two days.

Address .....

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 522 Broad St., Cor. Blackstone St., Providence, R.I.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300
With Handle Bar Control of Clutch $350
Two-Speed Gear, Extra $50
Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

THE TEXACO TRADE MARK.

Illuminated Red Star and Green T Make Effective Display at Boston Show.

One of the exhibits which attracted unusual attention at the recent Boston show was that made by the Texas Oil Company, New York City. This concern really had two exhibits, one in the basement showing storage systems for oil and gasoline and the other being in the balcony of Exhibition hall, where the well known Texaco lubricants were to be seen.

Illuminated Trade Mark at Texaco Oil Display.

The centre of the latter display was the monster illuminated red star and green T comprising the trade mark of this company. The large star, visible across the entire hall, was made of rich red Bohemian glass, and on this was mounted the green T and the name Texaco in brass letters studded with miniature electric lights.

A nickeled frame outlined the star and bore a number of sockets, each of which was a holder for a ray shaped glass container. These containers were filled with various lubricating oils, ranging from a ruby colored product at the apex of each point to an almost white oil at the base. The whole was illuminated by powerful electrics concealed behind a frosted glass star shaped background.

CONCERNING NATIONAL SHOWS.

Manufacturers' Executive Committee Favors Abandoning Truck Displays at Least.

In connection with the discussion considering the advisability of discontinuing the national shows in New York City and Chicago, it was announced last week that at a meeting of the executive committee of the National Association of Automobile Manufacturers in New York earlier in the month, it practically was decided to hold a national show in that city again next year. Similar action was taken with respect to the Chicago display in Chicago, Feb. 5.

It appears that there developed during the meeting some little opposition to a continuance of the truck shows in these two cities, and while no definite action was taken, the matter was referred to a special committee for further consideration. It also is announced that the trade failed to respond in sufficient numbers to warrant the erection of a special building for automobile exhibits at the Panama-Pacific exposition, and it was decided to accept the 60,000 square feet offered by the exposition authorities in the Transportation building.

WITH INVADER OIL.

E. F. Kalkhof Is Still Associated with T. E. Tomlinson as Advertising Manager.

An accompanying illustration presents E. F. Kalkhof, advertising manager of the Invader Oil Company, 80 Broad street, New York City, which recently took over the business of Chas. F. Kellom & Co., maker of Invader lubricants. He has a wide and very successful experience in this line of endeavor, and his copy while advertising manager of the Havoline Oil Company, and later of the Wolverine Lubricant Company, was of such character as to make him extremely well known in the industry as a publicity man.

E. F. Kalkhof, Advertising Manager, Invader Oil Company.

It will be remembered that T. E. Tomlinson, who helped to organize the Wolverine concern and has been for a number of years a decided force in the automobile lubricant field, is now vice president and general manager of the Invader company. Mr. Kalkhof has been associated with Mr. Tomlinson for a number of years and received his training under that leadership.

Digitized by Google

In connection with the announcement of Mr. Kalkhof's appointment comes the information that Mr. Tomlinson proposes to maintain his former policy in the development of the Invader oil business, and undoubtedly a vigorous advertising campaign will be inaugurated to place this product before the motoring public in a forceful manner.

PLANNING WOLVERINE TOUR.

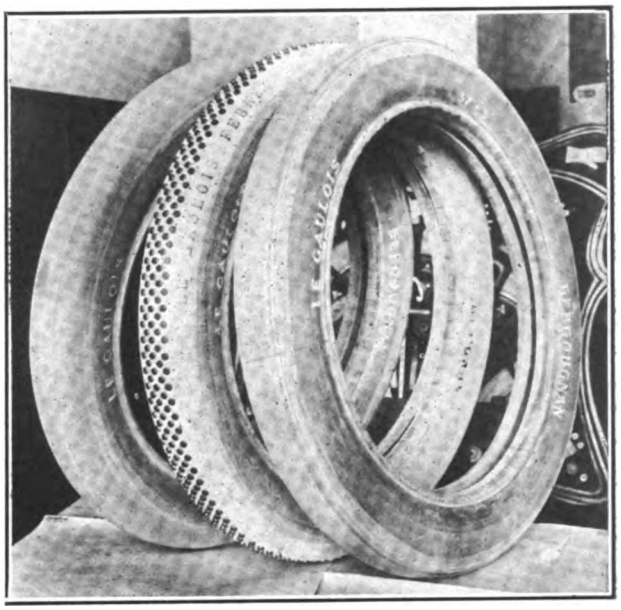
Many Detroit People to Watch Burman Pilot Keeton in 500-Mile Race.

The Wolverine Automobile Club, the leading motoring organization of Detroit, is preparing a tour to Indianapolis, Ind., when the 500-mile race is run May 30. The run will be the event of the year and the members will be particularly interested in Robert Burman, who is expected to have the single Detroit entry in the race, a Keeton car, made by the Keeton Motor Car Company. The club plans a record breaking entry for the trip, which will probably be by way of Chicago and return through Cleveland, O.

A special train has been arranged to take the members direct to the Speedway. Over 40 rooms have been engaged at the Claypool Hotel, Indianapolis, for May 29 and 30, and a special dining room has been reserved for the club members. Lunches will be served at the track and a block of 300 seats in the grandstand opposite the starting and finish line are already on sale at the club rooms. The Keeton company has reserved three boxes in the grandstand and eight rooms at the Claypool Hotel. Driver Burman will carry the colors of the Wolverine Automobile Club on his car and members of the club will be at the pits to assist Burman in every way possible.

ANOTHER PERU FACTORY.

Will H. Brown Is Instrumental in Securing Accessory Concern for That City.



Through the efforts of Will H. Brown and the directors of his company, the Brown Commercial Car Company, Peru, Ind., the Crum-Wiley Manufacturing Company, which has been enjoying an increase of business the past year, has been induced to locate at Peru. The company will manufacture all automobile accessories made in brass, its specialty being grease cups and other small parts used in the building of motor vehicles.

Besides Mr. Brown, the directors of the new concern are: President E. L. Crum, Vice President Max Krauss, Secretary-Treasurer S. A. Shesler and J. R. Woodring. The company was formerly located at Decatur, Ill.

GAULOIS TIRE DISTRIBUTION.

Etablissements Bergougnan to Be Well Represented in the Several States.

Following the recent announcement of the location of an American selling branch of the Etablissements Bergougnan, Clermont-Ferrand, France, maker of Gaulois tires, at 49 West 64th street, New York City, comes the information that those in charge are rapidly perfecting a system of distribution by states. It is expected that the appointment of several New England distrib-

Gaulois Tires of French Make Now Being Introduced in America.

utors will be made public in the near future.

It is understood that the French house is offering unusual inducements to jobbers and others, a sliding scale of discounts having been adopted with a view to hastening a general trial of Gaulois tires by users all over this country. The maker lays considerable stress upon the statement that there is no "speeding up" system in vogue in its shops and that each tire produced is leisurely built and carefully examined.

As an indication of the esteem in which these shoes are held abroad, it is pointed out that of the 34 cars taking part in this year's tour de France, held under regulations corresponding in a measure to the Glidden tour in this country, no less than 22 were equipped with this product.

NEW INCORPORATIONS AND MAKER'S NOTES.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

International Filter Company, Denver, Col.; $100,000; to manufacture gasoline filters for automobiles, motorcycles and gas engines; E. D. Motz, John N. Stewart, H. W. Kirby.

Willets Service Company, Inc., New York City; $50,000; motor vehicles and trucks; William C. Willets, Marius Jurgensen, Estelle M. Naylor.

United Auto Association, Los Angeles, Cal.; $10,000; H. W. Bohrman, Burt Dequine, C. L. Robinson.

Ross Ketchum Company, Inc., Saratoga Springs, N. Y.; $18,400; automobiles and bicycles; J. Arthur P. Ketchum, Norman B. Ross, James W. Northrup.

Hudson-Phillips Motor Car Company, St. Louis, Mo.; $10,000; to manufacture, sell and repair automobiles and trucks; C. F. Phillips, J. H. Phillips, J. E. Stewart.

Overland-Winton Sales Company, Worcester, Mass.; $10,000; George F. Fuller, Harlan T. Pierpont, Jay Clark, Jr.

W. C. Bates Company, Boston; $10,000; William C. Bates, William J. Munday, George A. Kersley.

Kingsbury Motor Sales Company, Inc., Hudson Falls, N. Y.; $10,000; Earle H. Wells, Esther L. Wells, Leonard Wetsell.

K. & K. Motor Car Company, Inc., Richmond, N. Y.; $10,000; Lillian E. Killian, Agnes E. Killian, Frank B. Killian.

Carels Diesel Motor Company of America, Wilmington, Del.; $10,000,000; H. E. Latter, W. J. Maloney, N. P. Coffin.

Capitol Body Company, Indianapolis, Ind.; $10,000; to manufacture and sell automobile tops and fenders; Elmer Hinshaw, Fred W. Heaschen, Elmer W. Hughey.

Brookville Auto Company, Brookville, O.; $10,000; sales, garage and repairs; J. Ward Somers, Edward B. Somers, V. T. Somers, John E. Somers, Anna Somers.

H. M. S. Motor Company, Inc., New York City; $22,500; motors and engines; Charles K. Starr, Joseph J. Myers, George P. Harvey.

Savoie Tire Company, Providence, R. I.; $100,000; Joseph Savoie, Edward C. Clines, Harry D. Reed.

Aquaero Manufacturing Company, New London, Conn.; $60,000; aeroplanes; Henry R. Bond, Jr., Edward C. Hammond, P. Leroy Harwood.

Norwood Garage, East Orange, N. J.; $10,000; Walter C. Jacobs, Dwight R. Davies, Louis Boehme.

National Garage Company, Cleveland, O.; $20,000; John A. Nally, C. A. Gardner, George L. Williams.

Pierce Speed Controller Company, Anderson, Ind.; $25,000; to manufacture and sell speed indicating and speed controlling devices; George W. Pierce, F. E. Mustard, U. M. McCullough.

Automobile Protective Association Company, Columbus, O.; $5000; guarding owners against theft of automobiles or parts thereof; William Lester, Mark A. Caputo, R. M. Switzer, E. L. Richards, A. M. O'Harra.

Chicago Original Auto Polo Company, Chicago; $6000; dealing in automobiles and operating places of amusement; Joseph R. Deahl, Frederick W. Moore, Marie C. Suhr.

Parsons Manufacturing Company, Toledo, O.; $10,000; to manufacture automobile appliances, novelties, etc.; George R. Seney, Irvin E. Austin, Charles W. Parsons, Henry T. Parsons, Helen W. Keier.

WITH THE MANUFACTURER.

The Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly-Springfield motor trucks, has announced the following managers of branches conducted in various cities, all under the firm name of the Kelly-Springfield Motor Truck Company: A. S. Holly, 239-241 West 56th street, New York City; P. S. Aultman, Shoe & Leather building, Cambridge A, Boston, Mass.; James Joyce, 4518 Baltimore avenue, Philadelphia, Penn.; Charles B. Packham, 1523 McGee street, Kansas City, Mo.; L. B. Garrison, 2439 Cottage Grove avenue, Chicago; Henry E. Schmidt, 511-513 East Pike street, Seattle, Wash.; Frank G. Miner, Fourth and Harrison streets, San Francsico, Cal.; J. L. Stone, 1036 South Grand avenue, Los Angeles, Cal.; A. R. Hayden, Dallas Transfer Company, Dallas, Tex.; D. C. Hathaway, 1829 East 13th street, Cleveland, O. A branch is also located at 800 Third avenue, Birmingham, Ala.

President J. J. Cole of the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, is on a trip through the West, repeating a similar trip through the East last year to familiarize himself with actual trade conditions.

I. R. Bailey, formerly manager of the mechanical goods department of the Diamond Rubber Company, Akron, O., maker of Diamond tires, has recently been appointed manager of the mechanical goods department of the Goodyear Tire & Rubber Company of the same city, maker of Goodyear tires. Mr. Bailey has been in the rubber business 25 years. With him also, W. M. Metzler, for 15 years factory superintendent of the mechanical goods department of the Diamond company, joins the Goodyear forces.

The Rapp Manufacturing Company, Toledo, O., maker of Visco spark plugs, has changed its corporate name to the Toledo Spark Plug Manufacturing Company, and is occupying the new Manufacturers' building. In addition to the well known Visco plug, so constructed as to show at a glance ignition trouble, the company will build a new spark plug to be known as the Ohio, without the visible spark gap seen in the Visco, in large quantities. It is also entering the motorcycle and marine engine field and a number of plugs for these engines has already been turned out.

The Planhard Manufacturing Company, Kokomo, Ind., maker of Planhard carburetors, has appointed through E. H. Stickles, its New York sales manager, the Eisner-Lenk Company of 1074 Boylston street, Boston, distributor for the Planhard carburetor for the entire New England territory. This firm is well known to the trade and will inaugurate an aggressive sales policy.

The Schacht Motor Car Company, Cincinnati, O., maker of Schacht cars, recently held an election of directors at a meeting of its stockholders, with the following results: G. A. Schacht, William Schacht, Harry G. Pounsford, A. O. Elzner, John F. Dietz, John H. Miller and Arthur Stem.

The Vanguard Manufacturing Company, which has been building for some time at Detroit, preparatory to removing from Joliet, Ill., is now in its new plant with a capacity for 1000 windshields a day.

The Bowling Green Motor Car Company, Bowling Green, O., maker of light motor trucks, has voted to double its capitalization from $100,000 to $200,000.

The Stewart-Warner Speedometer Corporation, Chicago, announces that the recent report that R. H. Baldwin had been appointed manager for the Stewart-Warner Corporation, was incorrect. Mr. Baldwin becomes assistant to E. W. McGookin, who for some time has been in charge of the Detroit office of the company.

The Stewart Motor Corporation, Buffalo, N. Y., maker of Stewart commercial vehicles, announces the appointment of the following agencies: Alco-Pittsburg Sales Company, Pittsburg, Penn.; Albany Garage Company, Albany, N. Y.; Stewart Auto Sales Company, Los Angeles, Cal.; Charles F. Brown, White Plains, N. Y.; Capitol City Auto Company, Hartford, Conn.; S. G. Chapman, San Francisco, Cal.; Ralph Careu, Montreal, Can.; Edward McK. Hunt, Newark, N. J.; Ross Maddocks, Medford, Mass.; Eastern Motor Company, Atlantic City, N. J.; Robert W. Powers, Fall River, Mass.; Middlebury Garage, Akron, O.; Medicine Hat Garage, Medicine Hat, Alberta; Pratt & Co., Argentine Republic; The Overland Company, Grand Rapids, Mich.; The Motor Power & Transit Company, Calgary, Alberta.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, announces the appointment of O. R. Wolf as factory representative and territory manager for the Central States district. Mr. Wolf will make his headquarters at Chicago with the Henderson distributor, the Tennant Motor, Ltd.

The Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler cars, has announced the appointment of J. A. Cramer, long recognized as a leading motor car dealer of Buffalo, N. Y., as exclusive representative in that territory.

The Studebaker Corporation, Detroit, maker of Studebaker pleasure cars and trucks, preparatory to the spring and summer business, has located its branches in new homes in the following cities: St. Louis, Mo.; Atlanta, Ga.; Omaha, Neb.; Minneapolis, Minn.; Salt Lake City, Utah, and Washington, D. C.

Digitized by Google

RECENT PATENTS.

Engine Hood Cover—Clinton D. Miller, Washington, D. C., No. 1,054,592. The cover is designed to envelop the hood and has a pliable flap adapted to swing over an opening in front.

Automobile Seat—Arthur F. Draper, Berkeley, Cal., No. 1,054,755. A casing is secured to the body of the car and the seat proper is hinged thereto. Means are provided for folding the seat member into the casing.

Bumper—George E. Legendre, Chicago, No. 1,055,057. Spring socket heads are attached to the extension of the frame and a link member is also employed in the connection. The plunger rods are equipped with springs.

Resilient Wheel—William Frederick Doll, Liberty, N. Y., assignor of one-half to Lee McClung, Washington, D. C., No. 1,053,976. The wheel comprises a continuous piece of spring metal coiled to form an inner member, a felloe and supporting member.

Automobile Pump—Richard Anton Goeth, Robert B. Rodgers and John Albert Dittmar, San Antonio, Tex., No. 1,054,762. The pump is designed to be secured to the wheel of the automobile and the piston is actuated by gears which are rotated by the wheel.

Detachable Tread—Junius A. Bowden, Los Angeles, Cal., No. 1,064,820. The shoe is provided with a detachable tread which has projections fitting recesses in the main tread. A wire is employed on each edge of the detachable tread for securing the parts.

Cushion Tire—Dexter J. Thayer, Pittsburg, Penn., No. 1,051,465. The tire is solid and is fitted to a channel shaped rim. Cushioning springs are mounted in the rim beneath the tread and retained by beads. An air space is provided between the springs and rims proper.

Shock Absorber—Fulton A. Green, Kittanning, Penn., No. 1,055,164. The device comprises a cylinder containing a non-expansible fluid, and a hollow piston. The downward movement of the car spring compresses the fluid and the recoil is compensated for by a spring member.

Dirigible Lights—Julius Marion Raiky, Coffeeville, Miss., assignor of one-half to C. K. Bailey of the same place, No. 1,055,225. The headlights are pivotally mounted and are actuated by a pair of arms which in turn are moved by a third arm connected to the steering mechanism.

Wrist Pin Device—Foster C. Rhoads and Hugh A. Leis, Dayton, O., No. 1,054,942. One of the bosses retaining the wristpin is fitted with an aperture carrying a spring and a retaining member. The latter is so constructed that it locks the wristpin, which has a shallow cavity.

Fender and Lamp Support—Richard Tyrell, Missoula, Mont., No. 1,049,946. The fender is made in two sections, partially covers the wheel and is secured in such manner that it moves when the front wheels are deflected. Provision is also made for the mounting of the headlights.

Electrical Connector—Richard H. Welles, Kenosha, Wis., assignor to the Badger Brass Manufacturing Company of the same place, No. 1,054,810. The device is a connector for electric lamps and comprises two shells or casings within which is the connector proper. A spring gripping member is employed having arms for locking the parts.

Auxiliary Steering Gear—John D. Maxfield, Hemet, Cal., No. 1,054,975. The steering device is detachably connected to the forward wheels of a car and projects in opposite directions. A hanger bar is secured to each of the members. Connection is by a cable which is led to a drum. Winding the cable upon the drum moves the wheels as desired.

Muffler—William J. Griffith, Plymouth, Mich., No. 1,055,270. The conventional shell has a number of circumferential grooves and the baffle plates are slidably mounted on rods extending longitudinally through the cylinder. The plates are held in a normal position by a spring and the arrangement of the parts is such that movement of the plates from normal increases the unrestricted area within the shell.

Anti-Skidding Device—Michael C. Harris, Philadelphia, No. 1,053,504. The device comprises a circular series of levers, each member projecting rearwardly between its ends in general V shape, the ends of each lever extending beside each side of the shoe for a short distance. Links are utilized for connecting the levers and a chain for retaining the device.

COMING EVENTS.

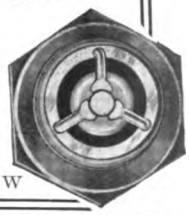
BOSCH PLUGS

FIVE POINTS OF SUPERIORITY

1 Substantial Construction—A liberal sized heavy insulator and solid steel body provide a massive yet neat construction.

2 Indestructible Insulator—The insulator is Steatite, an artificial stone having exceptional insulating properties, and neither brittle nor affected by heat, carbon or oil.

3 Leak Proof Assembly—But three principal parts allow a special construction forming one piece, eliminating all joints.



4 Heat Resisting Electrodes—Three nickel electrodes of extra weight withstand the heat of the most intense spark.

5 Ribbon of Flame—Knife edged and crescent shaped electrodes produce a broad ribbon-like spark passing readily at low speed.

O-TAK-A TIRE REMOVER.

Twenty-Five Thousand (25,000) Sold Last Season. Not a Single Complaint--- Every Tool Guaranteed. Money Refunded If Not As Advertised.

O-TAK-A Tire Remover is the only tool on the market that will release the lock ring by a plunger that forces back the floating ring without any injury by hammering or pounding the rings, causing bead blow-outs. See illustrations showing how it works, both hands free to move the tire. Users claim it's worth the price of the tool for putting on over sized tires and tires with innerliners. It holds the floating ring back while you are relieving the lock ring—it will not slip off. An extension or protrusion of the yoke which comes in contact with the under side of the rim extending behind the felloe acts as a shoulder, preventing the plunger from slipping off the ring. No other device in the market can use this shoulder. Reversing the tool on the wheel from the inner side forces the shoe off—no matter how badly frozen or rusted, it must come. Adjustable to any size tire.

No. 1 fits up to and including four and one half inches.
No. 2 fits four and one-half inches and over.

OUR GUARANTEE

Send your check dated 30 days ahead, try the O-Tak-A, if it fails to do all we advertise, stop payment on check. Return this GUARANTEE with your order for the O-Tak-A Tire Remover, $3, or the O-Tak-A Junior, price $1.50, and we will prepay express charges. O-TAK-A TIRE REMOVER, LeRoy, N. Y.

O-TAK-A JUNIOR---A BIG SUCCESS

Thousands in use by Ford car owners. A special tool for removing clincher tires. Will take your tires off instantly. Do not go motoring without the O-TAK-A JUNIOR in your kit. See illustrations how it acts. Adjustable to large size clinchers. For sale by all leading dealers. **Price $1.50.**

THE PRICE OF GASOLINE IS SOARING

But the M&M Economizer is still $3.50.

Patented Europe
Patented America

GUARANTEED to save from 40 to 50% of gasoline, and increase the SPEED and POWER 20% with less gasoline, and less carbon. The only carburetor adjuster on the market. Do not throw your old carburetor away until you have applied our device. THEN NOTICE RESULTS! The M&M is nickel plated and highly polished. Operated by friction hand or foot control. Automobile attachment requires a ¾" pipe tap to insert into manifold. Motorcycle size requires ¼" pipe tap.

THERE IS NO SCREEN PLACED INSIDE OF MANIFOLD, in connection with the M&M Economizer. Where a screen is used, it will clog the manifold, and make it harder for the motor to absorb the gas and air coming from the carburetor. When a car is equipped with the M&M, the manifold is clear from all obstructions and the motor can easily and swiftly absorb the gas and air into the cylinders.

Moller Bros., READ THIS: Van Buren, Ark. Feb. 26, 1913.

Gentlemen:—I have had the M&M Economizer installed on my Alpena, 40 h. p. Model F car, for some time, and it is working perfectly. It saves gasoline, brakes, clutch and tires, and is certainly fine for the engine. When descending grades, you are not only saving gasoline, but you are cooling your engine at the same time. If you want to increase your speed, you only have to tilt the friction foot pedal, and let a little air in, and your speed will increase instantly, without any more gas. If the carburetor is not working right, I give the pedal a little tilt, and the trouble is eliminated immediately. It certainly does more than you claim for it, and should be appreciated by all who purchase it. When they once have it installed, they will never take it off their car. Yours very truly,
(Signed) W. J. MARTIN, Jeweler.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

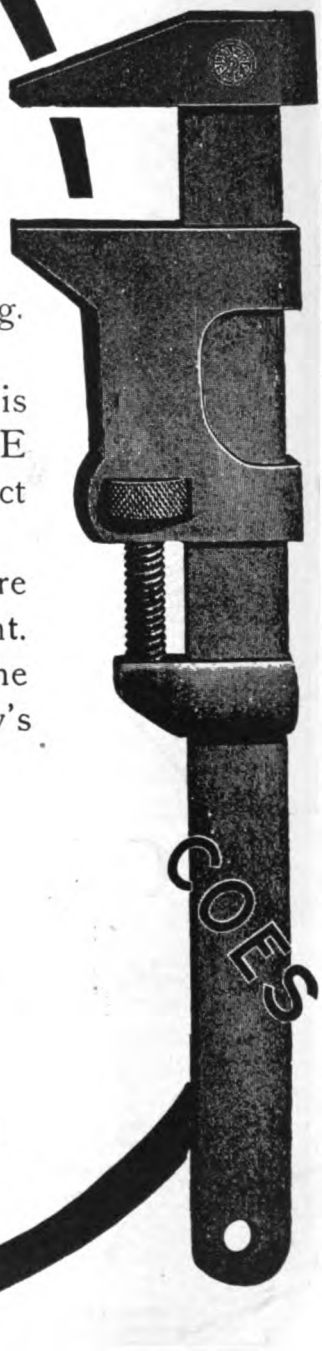
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

AMICO

WHY WORRY ABOUT YOUR SPARK PLUGS

AMICO

Why not equip now with the AMICO plug—non-leakable—un-breakable—the SERVICE plug, with the LONG LIFE. Absolutely the only plug made that will give guaranteed service. Note below its unique features. Try a set—if they are not as good as we claim, we refund your money cheerfully.

$1.00 EACH

High tension electrical porcelain of large diameter affording extra strength and durability—almost impossible to break.

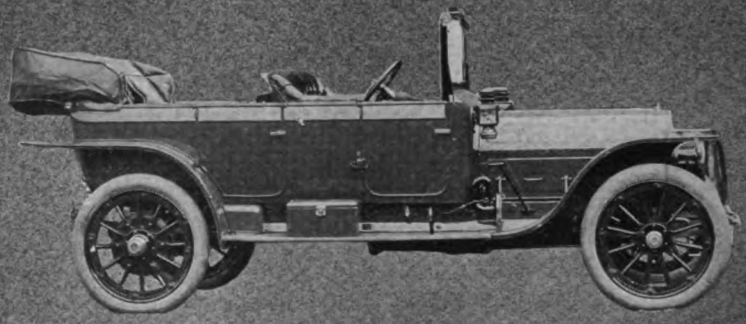
Vamped ridge—holds porcelain rigid at uniform pressure.

Asbestos packing set in taper seat ensuring perfect protection from explosion chamber—perfect joint, no leakage, each explosion blows clean the exposed parts in cylinder. Construction allows porcelain to expand on incline. Old types of plugs have square seat with no chance of expansion either way.

$4.00 the Set

The porcelain has an annular ridge which affords protection to the asbestos packing from the explosion.

Order a set to-day from your jobber or dealer or order direct. We pay Parcel postage. State size of thread



American Ignition Company, Inc.

Office and Factory
319 Adams Street, Dorchester, Mass.

United States Tires

have actually increased the sale of motor cars.

¶ It is a known fact that United States Tires today yield an average mileage from 25 to 50 per cent higher than that given by any make of tire previous to the organization of the United States Tire Company two years ago.

¶ Dealers, owners and car manufacturers everywhere acknowledge this.

¶ This increase in tire mileage has made the biggest reduction in the high cost of motoring that has ever been made since the automobile first came into use.

¶ It is a reduction that is bound to bring the automobile into still wider use among people of moderate means.

¶ It is a reduction that is bound to materially increase the car sales of every dealer in the country.

¶ Four-Factory Co-operative methods of tire building are responsible for it.

¶ America's Predominant Tire Concern has truly been a help to the whole motor car industry.

UNITED STATES TIRE COMPANY

United States Pneumatic Tires are guaranteed when filled with *air* at the recommended pressure and attached to a rim bearing either one or both of the accompanying inspection stamps. When filled with any substitute for *air* or attached to any other rims than those specified, our guarantee is withdrawn.

No-Rim-Cut Tires 10% Oversize

They Now Occupy the Throne

Goodyear tires, after fourteen years, hold top place in Tiredom. After men have used two million of them, they outsell all others. And by far.

Why don't you find out this year why so many men prefer them?

Visible Savings

No-Rim-Cut tires can't rim-cut. One glance will tell you that. With old-type tires, 23 per cent are ruined in this way.

You can also see that these tires are 10 per cent oversize. And that, on the average, adds 25 per cent to the tire mileage.

These visible savings alone are sufficient to win you to these tires.

The Invisible

But there are other savings, due to years and years of research and experiment.

Scores of experts, mostly technical graduates, devote their whole time to bettering Goodyear tires.

They have compared, by actual mileage, 240 formulas and fabrics.

On this department we are spending still $100,000 yearly, all to cut down cost of tire upkeep.

That's how Goodyears won. That's why hundreds of thousands of motorists now insist on Goodyear tires.

They mean no petty saving. The difference will amaze you. Ask any user, or go see these tires.

Write for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires.

This Sign Points The Way To The Best Lubricants

THE MOTORIST KNOWS—that the garage, supply man or dealer who carries HARRIS OILS and displays the HARRIS OIL sign is a RELIABLE dealer—the kind of man who seeks to serve his customers with the ***best*** regardless of "how much profit there is in it for him!"

MOTORISTS

Look for the HARRIS OIL sign. It's a sign of reliability—both as to the lubricants and the sincerity of the dealer who sells HARRIS OILS. You can buy ANYTHING in such a store with absolute confidence.

THE DEALER KNOWS—that customers come to him because of the HARRIS OIL sign. First, for the reason that it indicates a QUALITY dealer; second, for the reason that motorists who want to get ***real*** lubrication seek the supply store which sells HARRIS OILS. The wise motorist will go miles away from his route to obtain this most necessary accessory.

DEALERS

Get in line—get the sign—and hang it up before your store. Realize that this is another HARRIS OIL year. The motoring fraternity now know the value, the necessity of using HARRIS OILS—these lubricants are sweeping the field. Write us.

A. W. HARRIS OIL COMPANY

They Won't Do

By R. E. Olds, Designer

Right-side drive won't do in these days. Not when all the leading cars in America have come to left-side drive.

Old-style side lamps won't do. Not when all the leading cars have the set-in, flush dash lights.

Side and center levers are bound to be abandoned. The driver won't have his way blocked on one side—won't be forced to step out in the street.

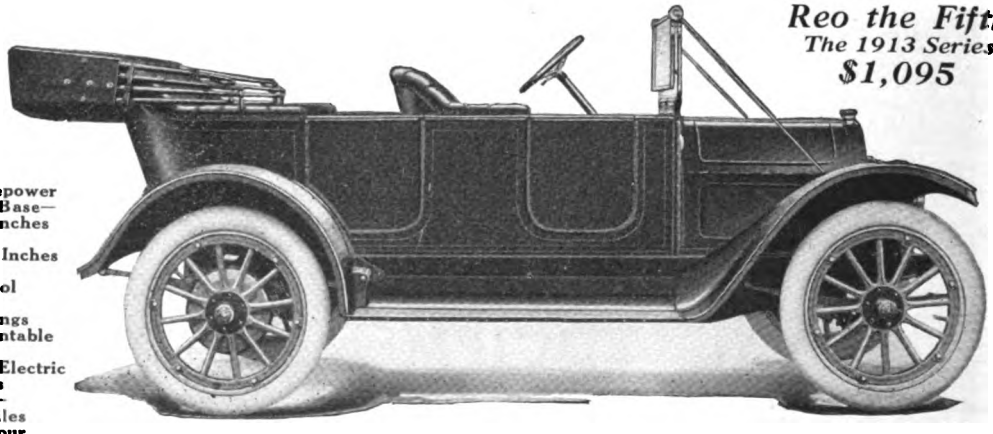
Common ball bearings won't do. Roller bearings cost five times as much, but durable cars must come to them.

Undersize tires won't do. Men are learning that big tires cut tire cost right in two.

Cars that are skimped in any way won't do. Men want big brakes, big springs. They demand big margin of safety.

They want analyzed steel. They want parts properly tested.

Men in these days buy cars for keeps. One-summer cars won't do. They seek a car which in five years from now will run as well as new.



They want a trouble-proof car. They want low cost of upkeep.

The demand for these things has made Reo the Fifth the leader of its class. It has sold on the average, since this car was created, twice our factory output.

Write for our catalog, then see this car at the nearest Reo showroom.

R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.

Here's a lesson for all new owners of cars—especially new owners of new cars

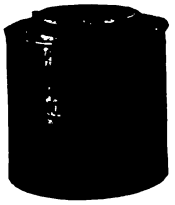
We want to reach you and teach you before you start your motoring career.

Know this: A motor car is essentially a power plant plus a system of shafts, bearings and gears. The real wear which disables and destroys, falls upon these mechanical units. Beautiful paint and upholstery can fade or crack but still your car remains a valuable machine if the working parts are true and silent in operation.

The car manufacturer puts his brains and money chiefly into these working parts—bearings and gears. That is where you must use supreme prudence and care if you wish long service from your car.

Lubricate every bearing systematically with NON-FLUID OIL.

That is advice reiterated now for fifteen years—advice which has helped thousands and thousands of motorists to realize service value from their car investments.



It is advice which has been strengthened and spread by over seventy manufacturers of cars who have tested the failure of other lubricants and proved the success of NON-FLUID OIL.

We cannot prove to you with bald statements that NON-FLUID OIL reduces friction to a harmless degree nor that it removes the nightmare of wear and tear. Friction diagrams, chemical shop talk, claims, comparisons, disparaging statements about other lubricants—all these things are a worthless means to urge conviction upon you.

We simply invite you in your own interest to use NON-FLUID OIL this first year.

If your dealer does not sell it, you will have to look elsewhere. Don't be tempted to accept another kind of lubricant. Don't do it. Be sure you get genuine NON-FLUID OIL packed in orange colored cans bearing this trade mark.

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE NON-FLUID OIL

Get it surely, or write us for it. We will ship it prepaid and arrange for your future supply with some dealer who will carry a stock.

NON-FLUID OIL is made in several grades and is sold in 3 lb., 5 lb., 10 lb., 20 lb. and 50 lb. cans.

K-000 Grade—for all the grease cups, for universal joints, steering knuckles, wheel hubs and for differentials requiring a heavy lubricant.

K-00 Special Grade is for sliding gear transmissions and for differentials which are oil tight. This lubricant has been so exceptionally successful for gears that it is regarded as a standard for this work. Other grades for timing gears, pump, etc.

Read "Lubrication of the Motor Car."

This is a complete treatise on lubrication, including a splendid LUBRICATING CHART.

Write us for free copy. Read carefully. Address Motor Dept.

THE TIRE SHOP

ANTHONY & HARRINGTON

FIRST CLASS VULCANIZING OF AUTO CASINGS AND TUBES

RE-COVERING A SPECIALTY

SECOND HAND TIRES BOUGHT AND SOLD

14 BELLEVUE AVENUE
NEWPORT, R. I., March 31, 1913.

Gaulois Tire Co..

New York City,

Gentlemen:-

During our nineteen twelve season our attention was called to four of your tires which had been run over 8,000 miles and seemed to be good for a thousand more.

Our customer asked us if it was possible to purchase that make of tire in this country and we told him it was not.

In looking through "The Automobile Journal" we see that you have established a branch office in New York.

Will you kindly send us your dealers and consumers price lists also any advertising matter that will attract attention.

If possible, will you kindly send us a few cross sections.

Thanking you in advance for anything you can do for us in this matter, we are

Respectfully yours,

ANTHONY & HARRINGTON.

DICT/CFH

Per. Chas. F. Harrington Jr

The above letter contains a message that will be read with interest by all users of automobile tires.

The Path of the Locomotive And the Path of the Tire

Consider this: The locomotive runs on a path that is smoother than a billiard table. Its tires are made of steel.

The automobile runs on a path that varies from the smoothness of the boulevard to the stone-strewn roughness of the back-country road in the hills. Its tires are resilient rubber.

As a matter of fact, the modern automobile tire is a marvel and its efficiency and economy in the face of the task it has are remarkable.

With the improvements found in WALPOLE TIRES—the extra-tough tread and extra-heavy sidewalls scientifically designed to protect against stone-bruise—still greater efficiency and reduction of tire cost are attained.

Walpole

"NO STONE BRUISE" Tires

reduce your tire cost per mile through longer service. This is a plain statement of fact that can be easily proven. Let us give you the proof.

CATARACT

TIRE-SERVICE

4000 MILE GUARANTEE

Mr. Motorist:—

Cataract Tires are the finest produced. Only the best of materials and workmanship enter into their construction. They cost more to produce per tire than any other tire made in America.

This season equip with Cataract Tires —They wear longer and give better service.

We guarantee them 4000 miles, but let us send you our book of testimonials. It will surprise you.

Mr. Dealer:—

A few territorial rights still open—get in touch with us by wire, phone or letter.

WHITE SEVEN PASSENGER SIX
Electrically Self Started and Lighted

WHITE CARS

Include All of the Improvements Which the Purchaser Should Insist Upon Obtaining in a High-Priced Car

The discriminating purchaser should protect himself against the possibility of his car becoming obsolete in design shortly after his investment.

It is not enough that the car he chooses measures up to the prevailing standards of the day. Undue depreciation is bound to occur unless the car embraces every one of these fundamental features of design:

Left Side Drive—Right Hand Control—Electrical Starting and Lighting
Long Stroke, Economical Motor—Monobloc Cylinders—
Four Speed, Selective Transmission.

To purchase a car that does not have every one of these important features is to purchase a car that is already practically obsolete.

White cars have possessed every one of these up-to-date, practical features for two years. In White Cars the protection of your investment is unquestioned for years to come. The superior value of White Cars is therefore evident.

And White Owners Know It

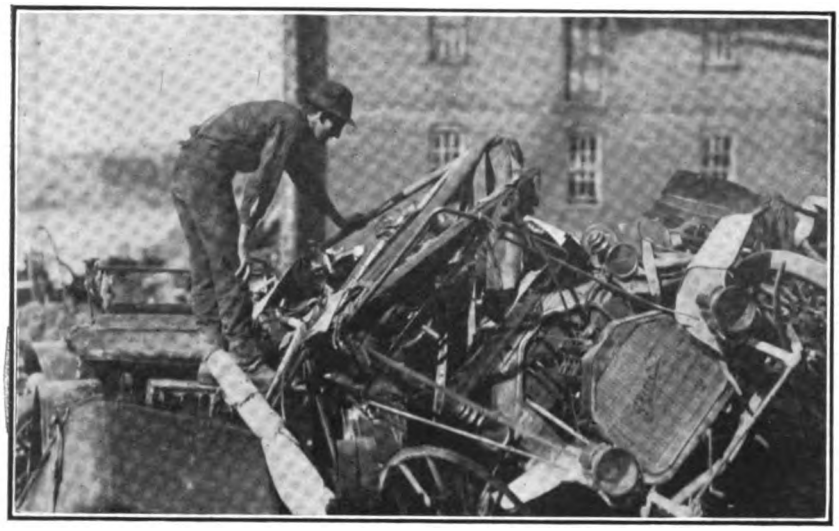
AUTOMOBILE SUPREME IN DISASTER.

Floods in Ohio and Indiana, and Tornado in Nebraska Demonstrate Its Pre-Eminence in Emergency---Industry Escapes Serious Losses and Concerns Affected Recover Rapidly---Latest Information from Stricken Districts.



REPORTS from stricken districts in Nebraska, Ohio and Indiana, as the result of the recent tornado and floods, immediately after work of re-establishing communication with the outside world had begun, seem to indicate that the automobile and kindred industries were not seriously affected. Several factories were reached by the rising waters, and while the financial loss in a few instances may be considerable, in a general way the concerns in that section will suffer most by the absence of shipping facilities. Business was suspended in many cities only because employees could not reach the plants and because they were engaged in the work of rescue.

But if motor car and accessory makers escaped serious damage through some fortunate combination of circumstances, the situation in each instance served to demonstrate in a very forceful manner the practicability and dependability of the modern automobile whether designed for business or pleasure. Railroads were washed away and trains bearing food and supplies were unable to reach their destination. Automobiles not only supplanted these in rushing needed supplies, but proved in-

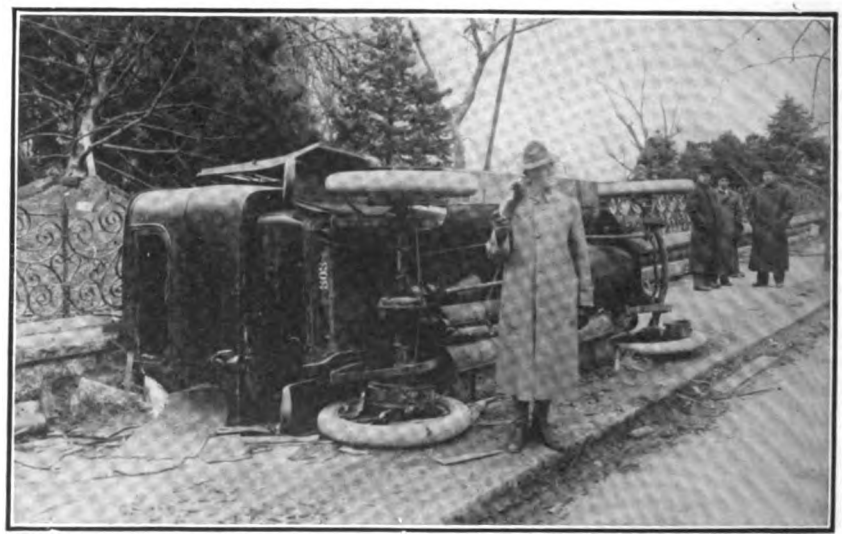
Maj. Wallace Sherwood, in Charge of Rescue Work, at North and Caldwell Streets, Indianapolis—Building on Right Was Carried Two Blocks by Flood.

Digitized by Google

Twenty New Cars Wrecked in Garage at Hamilton, O., Showing Effect of the Water at That Point—Photo by Underwood & Underwood, New York.

valuable in saving life. Long after horses were forced to give up the task because of the rising waters, motor cars and trucks were taking people from the threatened districts to higher land.

The conditions are such that the value of the motor vehicle will be brought still more to the attention of the public as the work of restoration progresses. Highways, bridges and railroads throughout the entire district affected in Ohio and Indiana must be replaced. In many sections it appears that the damage to highways was not as great as at first supposed, but for a time at least business of all sorts must depend to a greater or less extent upon the mechanical transport.



Dayton, O., suffered most seriously as a result of the flood. It appears that the three buildings of the Dayton Motor Car Company, now a subsidiary of the Maxwell Motor Company, had their lower floors filled with water. The offices and the finished stock room were damaged, but as there were only a very few cars on hand the loss was not great. Workmen were notified to report for duty March 31.

The Dayton Engineering Laboratories Company, maker of Delco starting and lighting equipment, and the Apple Electric Company, maker of the Aplco system, had their first floors flooded to the ceiling. The damage was largely to the building, this portion of the two plants being devoted to offices and shipping departments. The Dayton Manufacturing Company, producing lamps, and the Apple Top Company, also report slight damage from water.

The Speedwell Motor Car Company, maker of Speedwell cars and trucks, was located on high land and the water did not reach within two squares of the buildings. The same thing is true of the Davis Sewing Machine Company, maker of the Dayton motorcycle. The Wright Company, producing Wright aeroplanes, had a slight loss by fire, the old shop in which the Wright brothers made their first machines, being entirely destroyed.

The Speedwell company immediately placed all its available finished cars at the service of the relief committee, and cars and trucks were rushed from nearby cities. The Kelly-Springfield Motor Truck Company of Springfield, O., sent six Kelly trucks, and the Packard Motor Car Company of Detroit, eight Packard machines. All motor cars entering Dayton were commandeered and placed at the disposal of J. H. Patterson, president of the National Cash Register Company, as chairman of the relief committee.

The local agencies were situated on Third street, in the heart of the district most severely damaged. Not only were the buildings wrecked,

Soldier Guarding Overturned Car in the Path of the Tornado at Omaha—Photo Copyright by N. E. A., Underwood & Underwood, New York.

Digitized by Google

but show cars and office records were a total loss. It is estimated that some 200 machines owned in Dayton were carried away.

In the western part of Indianapolis, Ind., or West Indianapolis, the plants of the Nordyke & Marmon Company, Marion Motor Car Company, the Motor Car Manufacturing Company and R. J. Irvin & Co., were flooded by the breaking of a levee on the White river. The business section of the city was not damaged. The first floor of the Marion administration building was filled with water and many of the rescued were taken to the second floor in boats. While the Marmon plant was partially submerged, the company states that practically all of the finished product, considerable material, records, drawings, patterns, etc., were out of harm's way. It reported that it would be able to resume shipments within 10 days. The Pathfinder plant found itself in a similar situation. The Irvin company produces bodies and will not be affected seriously.

None of the other concerns in the industry in Indianapolis was a loser. The Cole, Henderson, National, Stutz, Premier and other companies not only placed a large number of testing machines and finished cars at the disposal of the Red Cross Society, taking people from the threatened district to their homes, before the flood really broke, but at least one, the National, was able to send relief cars to Dayton, O. The Empire Automobile Company, the Lyons-Atlas Company, the American Motors Company and the Waverley Company escaped damage and announced that they would be able to fill all orders as soon as the railroads were able to restore connections out of Indianapolis. The only doubt in the minds of any Indianapolis car manufacturer appears to lie in the possible inability to secure material on schedule time.

Wheeler & Schebler reports there will be absolutely no delay in the production of Schebler carburetors. The Prest-O-Lite Company was forced to shut down its plant temporarily on account of lack of power, but this should not interfere with shipments as a large number of full cylinders always is carried in stock. During the height of the flood this company equipped each rescue boat with a complete Prest-O-Lite tank and outfit.

The show of the Indianapolis Automobile Trade Association at the Coliseum, which was scheduled for March 24-29, was opened only one evening. The flood cut off all approach to the building, but after this had subsided somewhat, the display was opened Sunday, March 30, no admission being charged. Each person contributed as he saw fit, the entire proceeds, some $873, going toward the relief of the rescued.

Paul R. Martin, director of the Indianapolis motor speedway, announces that this track was undamaged. The speedway is situated on high ground northwest of the city and was several miles removed from the flood zone. Mr. Martin also is authority for the statement that the roads leading to Indianapolis are unharmed and with a few days of sun will be in excellent condition for touring. The flood will in no way affect the running of the third annual 500-mile international sweepstake race, Memorial Day.

One of the Six Kelly Trucks Taking on a Load of Supplies for the Flood Refugees in Dayton, O.

While the electric light and water plants were closed down in Anderson, Ind., as a result of the flood, thus depriving the manufacturing concerns of power, the resourcefulness of the automobile industry was amply demonstrated. A carload of Lambert farm tractors was on the loading platform at the Buckeye Manufacturing Company's plant, and immediately these were placed at the disposal of the proper officials. After nine hours' pumping with power supplied by the tractors the water plant was again in operation, the tele-

Digitized by Google

Henderson Car on Its Way to Relieve Householders Just Before Breaking of Levee in West Indianapolis.

phone plant was kept in service and other business was able to proceed.

The Remy Electric Company, maker of Remy ignition equipment, was soon able to resume operations, workmen in the plant hastily bolting a bank of American locomotive headlight generators, also made by this concern, to the floor and stringing temporary wiring through the various departments. An automobile engine was connected to a big generator in the dynamometer room, supplying power for the laboratory and development work.

None of the automobile concerns in Anderson was affected by water. The Buckeye Manufacturing Company's Lambert car and truck factory was unharmed, as well as that of the Nyberg Automobile Works, maker of Nyberg cars and trucks.

Although it was at first reported that the tire concerns in Akron, O., were badly damaged as the result of the flood, it transpires that the only plant to suffer was one of the Goodyear Tire & Rubber Company's buildings. Here the water entered the basement and put out the fires in the engine room. There was no damage to stock.

While the industry did not suffer in Youngstown, O., the Republic Rubber Company, maker of Republic tires, was able to render valuable aid to the city. The water works pumping station was flooded Tuesday morning, March 25, and immediately the rubber concern tendered the use of its private supply. Early Wednesday morning fire broke out in the business section, damaging property to the amount of $75,000. Had it not been for the Republic Rubber Company's supply it is probable nothing could have prevented the spread of the flames to adjacent buildings and the loss would have been tremendous. This service was continued until Saturday, when the city pumping station was able to resume. The city council has given the Republic company a vote of thanks and the citizens have expressed their appreciation of the service extended.

The flood did not reach Connersville, Ind., despite the reports sent out. Railroad communication was cut off by the absence of bridges for a week, and the most serious affliction was a shortage in the coal supply. The branch plant of the Empire Automobile Company, Indianapolis, was forced to close down because of a lack of fuel. The McFarlan Motor Car Company reported no loss and expected to resume shipments within a week.

The Inter-State Automobile Company, Muncie, Ind., reports that none of the factories in that city suffered directly by reason of the flood, although

Cole Machine Engaged in Rescue Work in West Indianapolis, Indicating the Extent of the Flooded District.

Digitized by Google

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

the water works system was shut down for 24 hours, because the boilers were submerged. While the railroads were crippled to a certain extent at first these have resumed operations and the Inter-State learns from the concerns supplying materials that there will be no delay.

The Muncie Gear Works learns that 13 bridges on prominent roads in Delaware county, leading to Muncie, were destroyed, but adds that active steps are being taken to replace these at once. The plant of this company was not affected, and it is understood that the same thing was true of the Muncie Auto Parts Company.

The Great Western Automobile Company, Peru, Ind., reported the resumption of shipments

Interior of the Coliseum in Indianapolis as Arranged for the Automobile Show, During Benefit for Flood Sufferers.

April 1. Although there was about five inches of water in the factory, the loss was very nominal. The first car left the paint shop after the flood April 3. The Peru Auto Parts Manufacturing Company says that while the plant contained from one to two feet of water, the damage was slight, and work was resumed under normal conditions March 31. Many of the workmen in Peru lost all their personal effects.

At Troy, O., which was located in the heart of the flooded district in that state, at least two concerns connected with the industry were seriously affected by water. The Troy Wagon Works Company, which manufactures wagons utilized as trailers for motor trucks, reports that the damage to the factory proper was very considerable, but by prompt and energetic measures everything was soon running normally. The office was badly flooded, damaging records and hampering work temporarily. The Troy Carriage Sun Shade Company, maker of windshields and other goods, announces that its plant was under six feet of water. It was expected that the windshield department would be reopened by April 7.

From Springfield, O., the Kelly-Springfield Motor Truck Company reports that this company was in no way damaged by the flood. The sole concern was with relation to the railroad situation, and it was feared that the receipt of material and the shipment of completed trucks would be delayed for a brief period.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel motorcycles, issued a statement indicating that the factory was not damaged, although it was forced to shut down because employees could not reach their work. A large number of officials and workmen lost their effects in the flood.

The Rutenber Motor Company, Marion, Ind., reports that the water did not reach its plant in that city, although within two feet of the east side of the factory. The concern's foundry at Logansport, Ind., is said to have been flooded to an average depth of three feet.

Digitized by Google

Water came very close to the plant of the Willys-Overland Company, Toledo, O., maker of Overland cars, but the factory escaped all damage.

The plant of the Columbus Buggy Company, Columbus, O., maker of Firestone-Columbus and Columbus electric machines, was reported as flooded to a depth of 10 feet, although the water did not reach the electric car department and the battery room was undamaged.

At Kokomo, Ind., it is understood the plant of the Apperson Bros. Automobile Company, maker of Apperson cars, was badly flooded. The Planhard Manufacturing Company, maker of Planhard carburetors, escaped damages, as well as the Kokomo Rubber Company, Kokomo Electric Company and Byrne, Kingston & Co. In the absence of definite information it is assumed that the Haynes Automobile Company, maker of Haynes cars, also was not damaged.

Ideal Truck Utilized to Pump Out Flooded Cellars in Its Home Town of Fort Wayne, Ind.

According to G. B. Hall, president of the Ideal Auto Company, Fort Wayne, Ind., maker of the Ideal commercial cars, the conditions in that city were not as bad as at first supposed. The Ideal factory was under four feet of water for 10 days, but the direct loss in materials was not as large as was anticipated. Mr. Hall thinks the main loss will come through the fact that the company had been doing a good deal of business and had many prospects in the towns and cities which suffered much more than Fort Wayne. Ideal trucks were utilized in a number of instances to pump water from flooded premises.

The Wayne Oil Tank & Pump Company, engaged in producing storage systems in Fort Wayne, had from two to 2.5 feet of water in the first floor of the office building, and the damage to machines, furniture, building, etc., is estimated at several thousand dollars. S. F. Bowser & Co., in the same line, suffered very little and the plant was closed down only about three hours.

The Ross Gear & Tool Company, Lafayette, Ind., reports that its factory was shut down for a week, but was making shipments the same as usual, April 3. Edward A. Ross, secretary of the company, does not believe the flood will have any serious effect upon the industry, except that there probably will be more trucks bought than would have been the case on account of the large amount of work that must be done over the flooded districts.

J. W. Wellington, factory manager of the Maxwell plant at Newcastle, Ind., writes that this concern was not injured in any way, the town being on the highest point of land between Cincinnati and Chicago.

Although no direct word has been received from Hamilton, O., it is understood that much damage resulted in that city. An accompanying photograph shows the effect of the flood upon one of the local garages, in which were quartered a score of new cars. The Republic Motor Car Company of that city is reported from Fort Wayne, Ind., to have received serious loss.

Homer McKee, director of sales and advertising for the Cole Company, Indianapolis, one of the most vivid writers of the industry, has summed up the situation with respect to that city in a manner which may be applied to the entire district. Mr. McKee says:

The automobile show has been held—but not where the band was playing. There was no lavender ribbon, no polish, no sales talk, no competition. Hub-to-hub Indianapolis cars proved that the city which they had made they could save.

The automobile has saved at least 1000 lives that the horse, the trolley car, the locomotive and even the boat would have missed. It has been everywhere. It has dragged the half-dead out of the water, hurried them to hospitals and then "beat it" for food and clothing. And it has not wearied.

Indianapolis has held her automobile show—out where humanity could see. Yesterday we admired the motor car for its beauty—today we stand before it in awful love of the steel that is in it—of the strength that was sufficient.

Digitized by Google

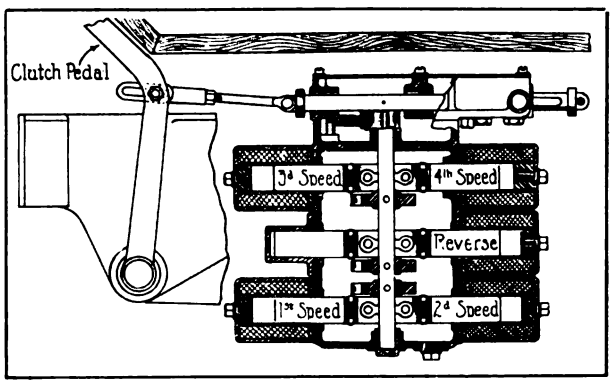
The floods in Ohio and Indiana were preceded only a few days by a destructive tornado in Nebraska, which cut a path across Omaha from the southwest to the northeast, leaving over 200 people dead, many hundreds injured, thousands homeless and a property loss estimated at from $5,000,000 to $10,000,000. C. G. Powell, secretary of the Omaha Automobile Show Association, writes that within 15 minutes after the storm broke over the city, automobiles of all kinds were bringing soldiers, firemen, police, surgeons and nurses to the scene of devastation. He adds:

"It would have been an absolute physical impossibility to have accomplished the great relief work which has been done in as short a time, without the use of these machines. They have been carrying provisions, stoves, bedding and clothing to the suffering; taking the injured to the hospitals and carrying soldiers, surgeons and nurses wherever needed. The automobile has done much for civilization, but nothing greater than the work it has been doing in Omaha."

THE NEW VULCAN ELECTRIC GEARSHIFT.

IN THE last issue of The Automobile Journal mention was made of the electric gearshift fitted to the S. G. V. car exhibited at the Boston show. Additional details of this product of the Vulcan Motor Devices Company, Philadelphia, are given herein and in an accompanying illustration is shown a sectional elevation, also the solenoids.

The system is not complicated, being controlled by solenoid coils, one for each forward speed and reverse. Two switches are utilized between the battery and solenoids, a knife switch controlled by the clutch pedal and the push button member located on the steering wheel. The knife switch controls all the changes and the wheel member only arranges the circuit for the particular speed desired.



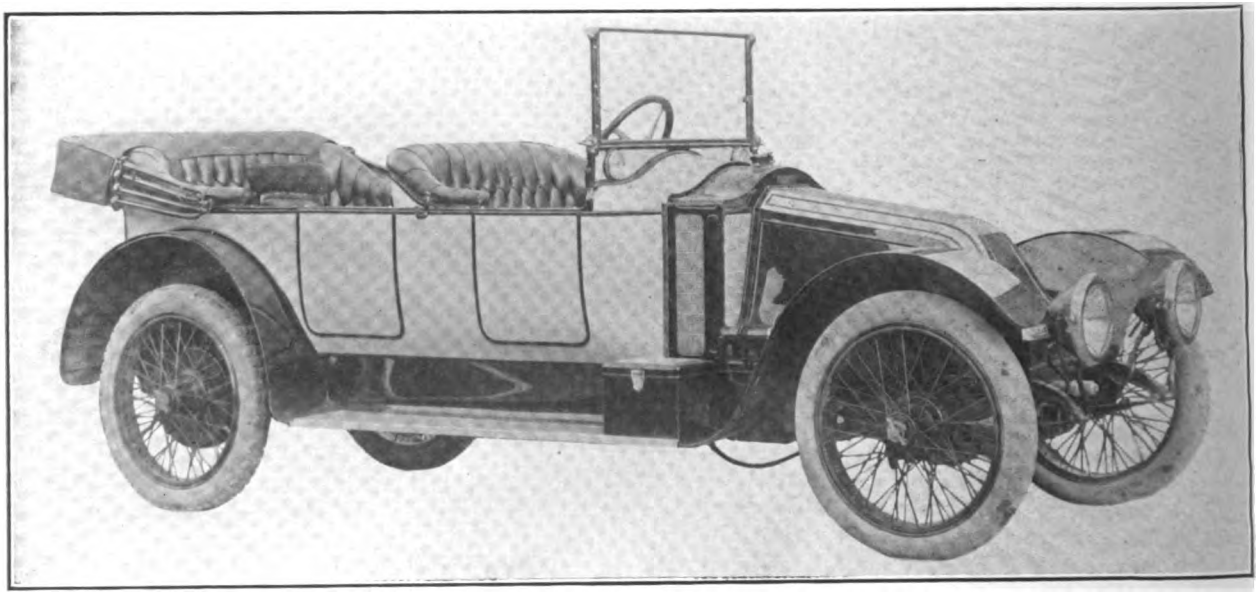
As will be noted by the drawing the clutch pedal moves through a link during the first part of its motion and during the balance picks up the link and carries it along with it. Thus the first movement is the conventional operation of the clutch, but the completion of the throw actuates the knife switch, current flows from the battery through the solenoid coil and pulls a plunger against a magnet with a force of 150 pounds. The energy is transmitted through an arm to the gear shifting fork and gear, securing the desired speed change.

The plungers are shown in a neutral position in the sketch and when the button is pressed on the control member a 12-volt current passes through the coils around the plungers, drawing them against the magnets. The current required to make the shift is held to be about 17 amperes and it is stated that about 300 changes of speed may be made with less current than is required to start the motor.

The gears cannot be stripped because the clutch must be disengaged before a shift is made, and the gears are always in neutral before the solenoids accomplish the change. This is purely a mechanical action through means of the clutch movement. No two speeds can be utilized at the same time because each speed is governed independently of any other and an interlocking device prevents the use of any two buttons at once by mistake.

The box containing the switches and solenoid coils is mounted at the side of the gearbox and it is stated that it adds but 46 pounds to the weight of the chassis.

On the S. G. V. car the control buttons were mounted in a neat aluminum box on the steering



Sectional View of the Vulcan Electric Gearshift, Showing Solenoids and Clutch Pedal Control of Knife Switch.

wheel, one for each speed and including a neutral member. The operation of the system is very simple. If the fourth speed button is pushed down the clutch thrown out and then re-engaged, the machine will be in the fourth speed. If in travelling in traffic on the third, the driver can set the second speed button and by depressing the pedal fully, shift into second. Similarly, changes may be made up. This is an advantage in that the operator does not have to lift his hands from the wheel. The system is quiet, the only perceptible noise being a slight click as the gears engage in the changing of different ratios.

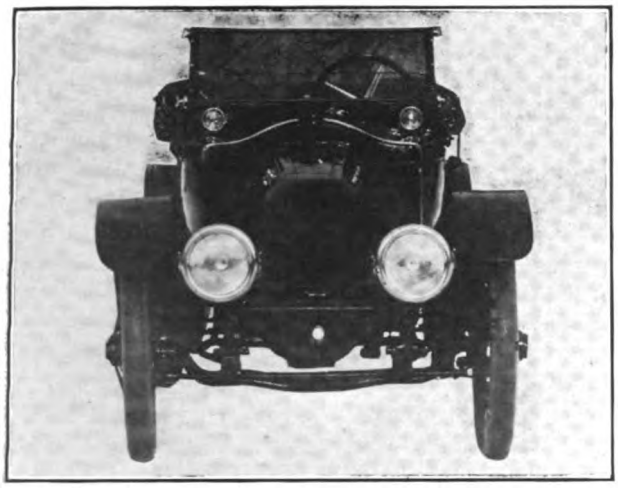
FEATURES OF NEW KEETON SIX-CYLINDER CAR.

THE Keeton Motor Company, Detroit, is producing one chassis for the present season to which is fitted three types of bodies. The Keeton Six 48 was designed to meet the demand for a medium size light weight car having ample power to meet all requirements of service at a minimum cost of upkeep. The chassis embodies mechanical features indorsed by leading foreign engineers and each component is such as to provide a large factor of safety. Throughout attention has been paid to small details and the material and workmanship are high grade. The bodies are roomy and comfortable and every convenience is included in the equipment, comprising electric lighting and motor starting, wire wheels, left hand drive and centre control. The standard bodies are a seven-passenger touring, a roadster and a coupe, these being known as the Riverside, Meadowbrook and Tuxedo, respectively.

The Keeton Riverside, a Seven-Passenger Touring Car of Distinctive Lines Having Six-Cylinder Motor of Ample Reserve Power to Meet All Requirements of Service.



The power plant of the Keeton is not only compact, but is noticeable for its simplicity and accessibility. The cylinders are cast en bloc of a special grade of gray iron and particular attention is paid to aging and machining. The motor is of the L head type with valves located on the left and has a bore of 3.75 inches and stroke of 5.5, a bore to stroke ratio of 1:1.47, which places it in the long stroke class. Although the S. A. E. rating is 33.75 the company claims a rating of 48 horsepower at 1100 revolutions a minute, which appears conservative when its piston displacement of 364.35 cubic inches is considered. Each motor is run on the block and carefully tested before and after being placed in the chassis.

The crankshaft is drop forged of high grade nickel steel, 1.75 inches in diameter, and is provided with four bearings of a special alloy metal. The dimensions of the bearings are ample, being as follows: Front, three inches; rear, four, and centre, two. The same material is employed for the connecting rod bearings, which are 1.75 inches in diameter by 2.25. Carefully cut timing gears and well designed cams not only make for accurate timing, but for a very quiet motor.

The valves are large, being 2.0625 inches in diameter, with nickel steel heads electrically welded to carbon steel stems. The valve guides and tappets are carefully machined from high grade material and the tappets are adjustable. The valve mechanism is enclosed by a single plate easily removed when desired.

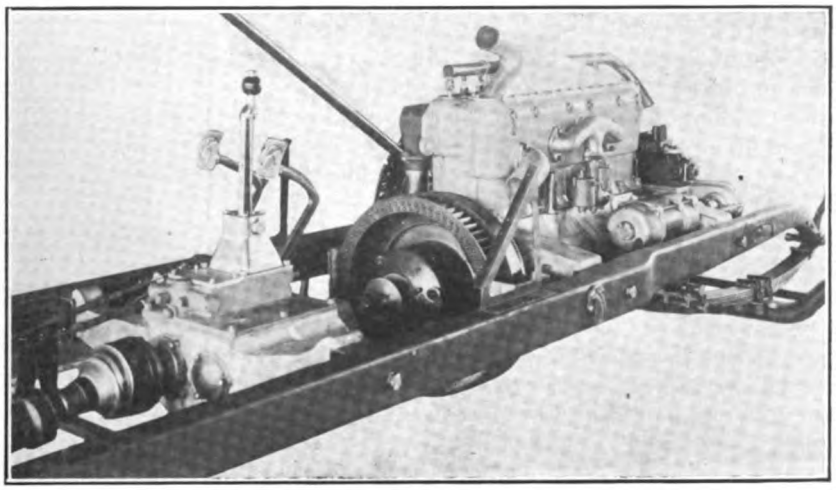
Carburetion is by a Zenith of the float feed automatic type located on the right hand side of the motor and heated air is utilized to facilitate vaporization. A strangler or valve is employed for making easy starting in cold weather. The intake pipe is well designed and free from bends, eliminating opportunity for the condensation of the gas. The exhaust manifold is a separate casting having radiating fins and its diameter and

Digitized by Google

Front View of Keeton Touring Car, Illustrating Dash Radiator and Compactness of Power Plant.

that of the exhaust pipe are sufficiently large to reduce back pressure to a minimum. The ignition system includes a true high-tension magneto.

The oiling system is of the circulating type, a gear driven pump forcing the lubricant from the crankcase direct to each of the main crank and connecting rod bearings through ducts in the crankshaft. The cylinder walls, pistons, rings, gears, etc., are lubricated by the surplus oil thrown off by the connecting rods. An accessible gauge is provided on the crankcase and being calibrated it is a simple matter to maintain the proper level and to prevent smoking. The capacity of the oil reservoir is three gallons.

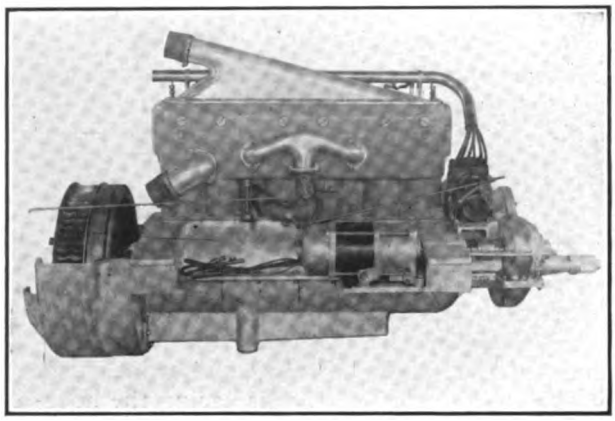


Cooling is by the thermo-syphon system. The water jackets are cast integral with the motor and are ample in size. The cooled fluid enters the cylinder from the radiator through a large sized pipe and passes out at the back through the outlet manifold, which is a single piece casting. The design and location of the radiator follow the practise of the makers of the Renault, Darracq and Arrol-Johnston. It is placed on the dash, affording protection as well as making for a greater "head" to the thermo-syphon circulation. Cooling is further aided by a large blower fan riveted to the flywheel, which forces the air through the sides of the radiator away from the body, keeping the floor boards cool.

The clutch is composed of 48 cone shaped steel discs, eight inches in diameter, enclosed within the flywheel, and operates in a bath of lubricant. Emphasis is put upon the easy engaging qualities of the clutch and it is also stated that it will not slip. Thrusts are cared for by large ball bearings.

The transmission is of the selective type, providing four speeds forward and reverse with direct drive on the third, the fourth speed being geared up 20 per cent. over the direct. The final gear ratio is 3.5:1, although 3:1 or 4:1 is optional. The gears are of chrome nickel steel, carefully cut to insure quiet operation and the shafts are of the same material, rotating in F. & S. imported annular ball bearings. The gearset is located amidships and provision is made for the replenishment of the supply of lubricant by means of a large inspection plate. By displacing the housing containing the gear shift mechanism the entire transmission is accessible for inspection, etc. But one universal joint is utilized, at the rear of the transmission housing, as the drive is a straight line under load through a concentric torque arm.

The rear axle is of the full floating type with a pressed steel housing and the axles are 1.375 inches in diameter of a heat treated chrome vanadium steel. The propeller shaft is of similar material and rotates in large F. & S. imported annular ball bearings. All gears are of chrome nickel steel, heat treated and carefully cut to insure noiseless operation. Provision is made for adjustment and inspection by a large plate back of the differential housing.



The front axle is of the Mercedes type, a single piece drop forging of heat treated steel of the I beam section design. All spindles, steering

View of the Keeton Chassis, Showing Centre Control, Left Hand Drive and Accessibility of Components.

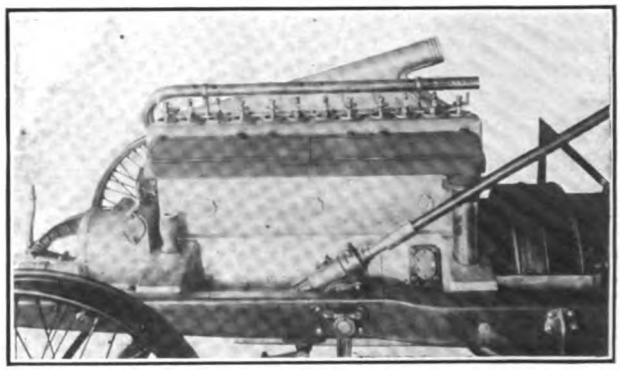
Digitized by Google

arms, etc., are of the same material, and are ample in size, affording a large factor of safety as well as serving to increase the durability.

Intake Side of the Keeton Motor, Showing Location of Combined Dynamo and Motor and Method of Driving Magneto.

Particular attention has been paid to the matter of springs and a special alloy silico manganese spring steel is utilized. Each leaf is carefully ground and polished, the front members being semi-elliptic, 36 inches long and two wide. Three-quarter elliptic springs are fitted at the rear, these being 50 inches long and two wide. Grease cups are provided at all points subject to friction.

The frame is of heat treated pressed steel with depth of channel 4.0625 inches and is inswept at the front, providing a short turning radius. The drop in front is 5.5 inches, while the kick-up at the rear is five inches. Although the centre of gravity is low there is a road clearance of 11.25 inches under the lowest part of the chassis.



The steering gear is of the worm and full gear semi-irreversible type and is provided with large thrust bearings, easily adjusted for wear. The column is set at a comfortable angle and is surmounted by a walnut steering wheel, 18 or 20 inches in diameter, as desired. It carries but one control member, that of the gas.

Detachable wire wheels with quick detachable rims or demountable rims with wooden wheels are fitted, and 36 by 4.5-inch tires are standard both front and rear. The wire wheels are interchangeable and may be removed by a quarter-turn of a wrench. When this type is utilized the spare wheel is carried at the rear of the body, over the fuel tank, on a false hub. The wheelbase of all models is 136 inches with tread standard, 56.

All models are equipped with very powerful brakes and both sets are contained within the rear wheels, fully enclosed and protected from dust, etc. Each set acts on separate drums of two-inch face and the diameter of the service members is 16 inches; that of the emergency, 12. Both are of the internal expanding type lined with Thermoid, and equalizers are utilized, these being mounted directly on the rear axle. Both sets of brakes may be adjusted by turnbuckles under the front floor boards and the mechanism is very accessible.

The fuel tank is located at the rear of the chassis, and its capacity of 24 gallons is sufficient to meet all requirements in touring, as the motor is held to be very economical of gasoline. The container is equipped with a gauge for noting the amount of fuel on hand. Pressure feed is utilized with pump located on the power plant and two pounds is normally maintained in the tank. The usual hand pump mounted on a bracket between the front seats provides pressure for starting after refilling the tank and when the car has stood for a considerable period. The conventional pressure gauge is located on the front toe board.

The control of the Keeton is very simple and it should be handled easily. The operator is seated at the left with the speed changing lever in the centre at the right. This lever is of the rocking type, surmounted by a ball grip containing the reverse release latch, which prevents shifting into the reverse by mistake. The clutch and service brake pedal are at the left and an aluminum heel rest is incorporated in the floor board. The emergency brake is actuated by the right pedal and it may be locked when desired by a simple ratchet, and as easily released. This arrangement of the brakes not only simplifies control, but enables the operator to employ both

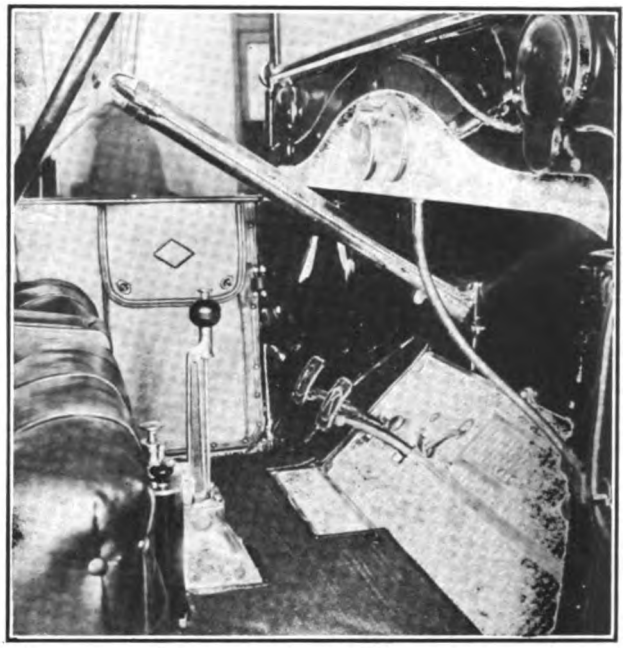
Exhaust Side of Keeton Power Plant, Noticeable for Its Accessibility and Clean Appearance.

hands in steering. The usual accelerator is located between the pedals with a cut-out member at the right of the emergency brake pedal. The

Digitized by Google

gas control differs from conventional practise in that the lever is similar to an inverted U and is mounted on the column under the wheel.

The dash is noticeable for its clean appearance, containing only the combined 80-mile speedometer and eight-day clock mounted flush and lighted by electricity. The electric lighting and motor starting system is a Jesco, a combined unit mounted on the right hand side of the motor and gear driven. The system is operated by a very compact switch located between the front seats and provision is made for locking. Energy from the motor starter is imparted by silent chain to the end of the crankshaft and all parts are fully enclosed and well lubricated.



Thoroughness of detail is noticeable throughout. The motor is fully protected from dust, mud, etc., as the lower half of the crankcase forms an aluminum pan that extends under the flywheel and blower fan. This with a hood completely enclosing the power plant prevents the entrance of foreign elements. The mudguards and aprons are reinforced sheet steel, securely retained to prevent rattling and are black enamel. The running boards are laminated wood covered with cork linoleum and bound with aluminum angle strips, a construction easily kept clean.

The bodies fitted to the chassis not only present attractive lines, but were designed to provide ample space both in front and in the tonneau. There is room for auxiliary seats in the touring bodies. The material employed is sheet steel over a wooden frame, making for strength and durability. The upholstery is deep, of the finest grade of hand buffed, pebble grained, black leather stuffed with curled hair over special springs. The seats are very wide and their angle, as well as that of the back cushions, is such that long trips may be undertaken with comfort. Pockets are provided for the storing of maps, gloves, etc., in the doors and shroud.

The equipment is very complete and the accessories are high grade. The top is a special design of carefully selected silk mohair with glove fitting envelope and self-contained inside folding Jiffy curtains. The windshield is of the rain vision type and has special ventilating features. Included in the electrc lighting system is an extension light which is plugged in on the dash, and a device for warming the carburetor and intake pipe in cold weather. Large tool boxes are located on the front end of the running board and the balance of the equipment comprises the usual pump, jack, kit of tools, tail light, license holder, electric horn, robe and foot rails, tire repair outfit, among other accessories.

The Riverside model is a fore door, seven-passenger touring car, very roomy and distinctive in appearance. The Meadowbrook is a two or three-passenger fore door roadster, the extra passenger being carried in a detachable folding seat on the rear deck. This design provides large space for the carrying of baggage. The Tuxedo model is of the coupe type, fully enclosed. The finish is in keeping with the high grade construction throughout and all trimmings are nickel or black enamel.

Under the terms of a new ordinance in New York City, anyone having charge of or handling gasoline in a public garage must secure a certificate of fitness from the fire department. The fee is $5 and the penalty for non-compliance is a fine of $500 or imprisonment not exceeding six months, or both. The ordinance applies to owners who have been accustomed to enter garages and fill their own tanks as well.

Operation of the Keeton Is Simplified by Grouping the Convenient Control Members.

The B. F. Goodrich Company, Akron, O., has announced a reduction in prices affecting the Goodrich tires made by it and the Diamond tires, made by the Diamond Rubber Company, a subsidiary corporation. Similar announcement has been made by the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, and it is assumed other concerns will be added to the list. The reduction in price went into effect April 1.

GENERAL NEWS OF THE INDUSTRY.

Goodyear Tire & Rubber Company to Erect Factory in Rio de Janeiro, Brazil---Proposed New Tariff Bill and Its Effect---Business Changes, Etc.

ACCORDING to announcement made in New York City, the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has entered into an agreement with the government of Brazil for the erection of a factory for the production of rubber articles in that country. The move is understood to be in accordance with an act passed by the Brazilian congress some time ago, under which the President was authorized to grant exceptional favors to the first concern to locate a plant of this character in Rio de Janeiro. These included a cash award of about $167,000, the right to expropriate land upon which to erect the factory, and exemption of all customs duties on chemicals and products used as compounding ingredients and fabrics of all sorts, as well as municipal, state and federal taxes.

Proposals were received after specific regulations defining the real intention and purpose of every clause bearing on these concessions were prepared by the minister of agriculture and commerce, and a committee was appointed to pass upon them. It appears from the report that the proposition presented by the Goodyear company was most acceptable.

THE NEW TARIFF BILL.

Rates on Automobiles Unchanged but Parts and Tires Are Considerably Reduced.

Coincident with the opening of the extraordinary session of Congress, April 7, the new Underwood tariff measure was introduced and its provisions made public. The automobile industry is very much interested in the effect this would have if the bill were to be enacted into law as presented. It is expected, of course, that numerous amendments will be made before the measure reaches President Wilson for his signature.

The new tariff bill is a voluminous document, and doubtless there are many articles utilized in the production of motor cars and their accessories which do not appear in the summary which has been prepared for more ready reference by those who may be interested. This summary shows that the rate on automobiles, as such, is unchanged, being the same as under the so-called Payne bill, 45 per cent. Automobile parts, excepting tires, however, are listed at 20 per cent. and chassis without bodies are placed at 30, instead of 45. Motorcycles also receive a cut of 5 per cent., the Underwood rate being 40 instead of 45. Aeroplanes are reduced from 45 per cent. to 25.

Schedule N provides for duties on manufactured articles from india rubber, gutta percha, etc., and shows a reduction on this item from 35 per cent. to 10. The item covering rivets, studs, steel points, brightened, and same for automobiles, in schedule C, bears a reduction from 45 per cent. to 20. Tungsten bearing ores are to be admitted free.

Among the articles entering into the manufacture of automobiles or fittings to be affected are: Mica and manufactures of, 10 cents a pound and 20 per cent., to 30 per cent.; carbon electrodes, brushes and plates, 30 per cent. to 25; lava burner tips, 10 cents a gross and 15 per cent., to 15 per cent.; oils and greases not otherwise provided for, 25 per cent. to 15; aluminum scrap and alloys, seven cents a pound to 25 per cent.; aluminum plates, sheets, bars and rods, 11 cents a pound to 25 per cent.; calcium carbide, 25 per cent to 10.

BRANCH FACTORY IN TOLEDO.

Perfection Spring Company to Erect Plant Near Willys-Overland Property.

It is announced that the Perfection Spring Company of Cleveland, O., is to build an automobile spring plant at Toledo, O., and construction work will begin in a few weeks. The Perfection company recently purchased six acres of land, situated between the Willys-Overland company and the boulevard, with railroad frontage.

According to Christian Girl, president of the company, the capacity of the plant when finished will be 9000 tons a year. A large portion will be run exclusively for the Willys-Overland company, with which the spring concern has long time contracts. About 100 men will be employed at the start, but later it is expected that fully 800 men will be engaged.

LOZIER INCREASES CAPITAL.

Stockholders Approve Plan to Add $2,000,000 Needed to Meet Increased Demand.

Stockholders of the Lozier Motor Company, Detroit, maker of Lozier cars, at a recent meeting, authorized an increase in the company's capital from $3,000,000 to $5,000,000. This will consist of $1,000,000 in 7 per cent. cumulative preferred and $1,000,000 in new common. The additional stock is necessary, according to President H. M. Jewett, to meet the big demand for the new type of car introduced in December.

The stockholders of the Lozier company have already subscribed for a large proportion of the new preferred which is being offered at par, and the new common will be retained in the treasury for use in conversion of the preferred. With the new issues the company's capital will consist of $3,500,000 of common and $1,500,000 7 per cent. cumulative preferred.

The present year marks the 10th anniversary of the Lozier company, the first Lozier car having been produced at the Plattsburg, N. Y., factory in 1904. March 15, 1911, the new $1,000,000 plant at Detroit began active operations with the shipment on that date of the first car to be completed in the Detroit plant. Between 1200 and 1500 men are employed in the two plants at Detroit and Plattsburg and in order to keep pace with sales this working force may soon be largely increased.

MAXWELL ABSORBS FLANDERS.

Formal Announcement Indicates That Previous Information Was Somewhat Premature.

Announcement is made by the Maxwell Motor Company, Inc., that arrangements have been completed for the acquisition by it of the property and business of the Flanders Motor Company, subject to the necessary corporate action on the part of the two companies, which it is expected will be obtained shortly. Pending the transfer to the Maxwell company of the property of the Flanders company, the latter will be operated as a branch of the Maxwell Motor Company.

Commenting upon the formal announcement, a prominent officer of the Maxwell company stated that while it was generally understood in the trade that the Flanders company was already a part of the Maxwell concern, this was not so, action being delayed until inventories were taken, audits made and other matters straightened out. Simultaneous with the absorption of the Flanders Motor Company, the financial and accounting officers of the Maxwell company were removed to Detroit. That city now becomes the centre of operations for the new concern.

SECURES MANUFACTURING PLANT.

New Detroit Concern to Produce Automobile Fenders and Stamped Steel Goods.

John W. Murray, formerly connected with the Michigan Steel Stamping Company, Detroit, has purchased the buildings and site at Clay and Michigan Central streets, formerly occupied by the Old Crown White Lead Company, and will begin the manufacture there of automobile fenders and other articles in stamped steel.

Machinery has been installed and operations have been begun. There are two brick buildings, each two stories high, and a frame structure, giving a total floor space of 22,000 square feet. The property, which was formerly owned by the Acme White Lead Works, is valued at $50,000.

ANOTHER TIRE CONCERN.

Mohawk Rubber Company Purchases Stein Double Cushion Tire Plant at Akron.

The Mohawk Rubber Company has been organized at Akron, O., and has purchased the Stein Double Cushion Tire Company's plant and machinery. The new company is organized with a capitalization of $350,000, of which $250,000 is common and $100,000 is 7 per cent. cumulative preferred, redeemable at 110, with accrued interest after Jan. 1, 1916. The plant is located at East Akron, near the factory of the Goodyear Tire & Rubber Company, and consists of a three-acre tract of land, a brick factory in good condition, with railroad switching facilities and free water rights. The capacity of the factory is between 75 and 100 tires a day. The Stein company has discontinued and liquidated its business.

The president of the new company is R. M. Pillmore, who for a number of years was general manager of the Akron Grocery Company, and is at present director of public service of Akron. S. S. Miller is superintendent of the plant. It was he who laid out and built the Buckeye plant of the Kelly-Springfield Tire Company at Akron, and up to a few months ago he was in charge of the manufacturing department of that company. C. W. McLaughlin, formerly assistant cashier of the Diamond Rubber Company, is treasurer, and

Digitized by Google

M. E. Mason, secretary and sales manager, was formerly connected with the sales department of Morgan & Wright, which he joined in 1897. During the last two years he was with the central district office of the United States Tire Company. The directors are: C. D. Paxton, Cleveland, O.; J. K. Williams, Akron, well known maker of rubber machinery; F. J. Mishler, Akron, vice president of Citizens Savings & Loan Company; S. S. Miller, Francis Seiberling, C. W. McLaughlin and M. E. Mason, all of Akron. The company intends to produce guaranteed automobile casings and tubes of high quality and new equipment for standard clincher and quick detachable casings has been ordered. The new product will be ready for the market in a few weeks.

PURCHASES DETROIT FACTORY.

Peninsular Lead Works Plant Acquired by Syndicate Interested in Automobile Parts.

K. S. Morgan, representing a syndicate which will manufacture automobile parts, has purchased the three-story solid brick factory at Lieb and Guoin streets, Detroit, of Edward J. Schmidt, who made the sale as president of Traugott Schmidt & Sons. The consideration is said to have been $40,000 cash.

The plant, which has a frontage of 250 feet and a depth of 125 feet, was erected by the Peninsular White Lead Works, and has been successively occupied by the Schmidt company and Keen & Co., maker of automobile parts. Improvements to the property are being made with a view to beginning immediate operations.

FISK RUBBER WINS SUIT.

Thropp Tire Patent Held to Be Invalid by Reason of Anticipation.

The United States court of appeals for the first district, New York City, has rendered an important decision affirming the decree of the district court, which held that the claims of United States patent 822,561 to P. D. Thropp were invalid by reason of anticipation. Suit was brought against the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, for infringement of this patent, which it was alleged covered the form of mold used in the manufacture of tire casings by the one-cure wrapped tread process.

This case has been before the courts for nearly four years and the two decisions in favor of the defendant company are of great interest to the tire makers of this country by whom the one-cure wrapped tread process and the apparatus involved in this suit have been used very extensively.

NEW INSURANCE COMPANY.

Connecticut Concern Will Undertake to Assume Risks on Automobiles and Aeroplanes.

The Automobile Insurance Company, Hartford, Conn., has been organized under Connecticut laws with a capital of $2,000,000. The company is said to embody a new idea in indemnity and among its unusual powers will be authority to write policies on aeroplanes and automobiles and to cover them against every hazard, including fire.

The company assumes and revivifies the six-year-old charter of the Manufacturers Fire & Marine Company, which never was organized. Former United States Senator Morgan G. Bulkeley, president of the Aetna Life Insurance Company, secured the old charter. Associated with him will be John H. Hale, public utilities commissioner of Connecticut.

SOUTHERN TIRE PLANT.

Seminole Rubber Company Selects Jacksonville, Fla., Because of Shipping Facilities.

According to plans which the incorporators state are practically completed, Jacksonville, Fla., will have a big industrial plant, employing 500 persons and producing 300 automobile tires a day, together with other automobile accessories in which rubber is used, to be known as the Seminole Rubber Company, a concern with $1,000,000 capital. The company is the first rubber manufacturing firm to be located in the South and the plans provide for the construction of a large building and the actual operation of the plant within 90 days.

George F. Hardy, George H. Lutz and J. J. Weyer are named in the application for charter as the incorporators. The principal inducements that attracted the new concern to Jacksonville are stated to be the immense field in the South for its product, the city's unequalled advantage as a port of entry for the crude rubber from South America and the shipping of the manufactured product by water, and proximity to the raw material from the cotton fields, especially the Sea Island product, which is used extensively in the manufacture of automobile tires.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

Bosch Spark Plug.

The Bosch Magneto Company, New York City, is manufacturing the Bosch spark plug, which is constructed both for motor cars and motorcycles. The insulator is steatite placed in the shell under high pressure, insuring a gas tight construction. The electrodes are a nickel alloy and being knife shaped the spark does not jump across at any particular point, but forms a ribbon of flame between the electrodes, which are three in number. Sooting is prevented as the electrodes are maintained at a high temperature, burning away the lubricant that may gather. The plugs are in various sizes, and are adapted to withstand magneto currents.

Buffington Folding Chair.

C. A. Buffington & Co., Berkshire, N. Y., is manufacturing a folding chair especially designed for motor cars. By a single movement, forcing it backward, the chair collapses into a three-inch space. It weighs but nine pounds, is constructed of a high grade metal and comes regularly in japan finish, although copper or nickel plated designs are made. The seat is upholstered and a suitable back is provided. The height varies from 12 to 18 inches.

Austin Motorcycle Pump.

The Austin motorcycle pump is manufactured by H. K. Austin & Co., 27 Lincoln street, Reading, Mass., and is a patented article. The inlet at the base has a double cup washer on the plunger rod with a long wooden guide plug. The feature of the pump is the flexible coupling, which is so designed that it will fit all types of tire valves. It is applied by slipping over the valve stem and it does not leak. It is easily removed and in addition to saving time, can be utilized where the valve stem threads are damaged. The motorcycle pump is very compact and is guaranteed for two years. The Austin patent flexible coupling is adaptable to all types of tire pumps.

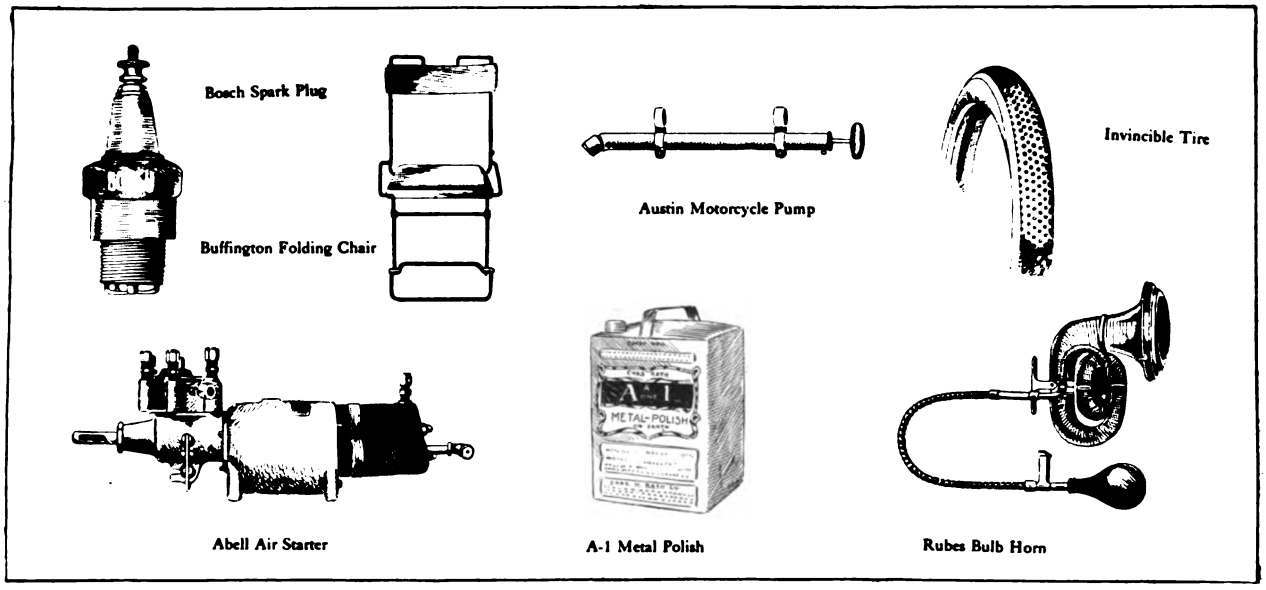
Invincible Tire.

The Invincible Puncture Proof Tire Company, 53 Sabin street, Providence, R. I., not only rebuilds old casings by fitting its tire, but guarantees 3000 miles of service without a puncture or blow-out provided no filler is used other than a standard inner tube and that the air pressure is properly maintained. The Invincible is a French chrome leather covering extending entirely around the tire and down under the bead. The tread is composed of three layers of material. Projecting case hardened steel studs are fitted to the tread proper and flat studs on the sides. Between each layer of leather is a special water proof cement and the parts are vulcanized. The studs prevent skidding and the plies of leather prevent puncturing. The leather is held to be water proof through a special treatment and heating is reduced to a minimum by the practically solid construction. It is also stated that less friction is developed. Blow-outs are prevented, especially at the side walls through the reinforcement of leather cemented to the shoe.

A-1 Metal Polish.

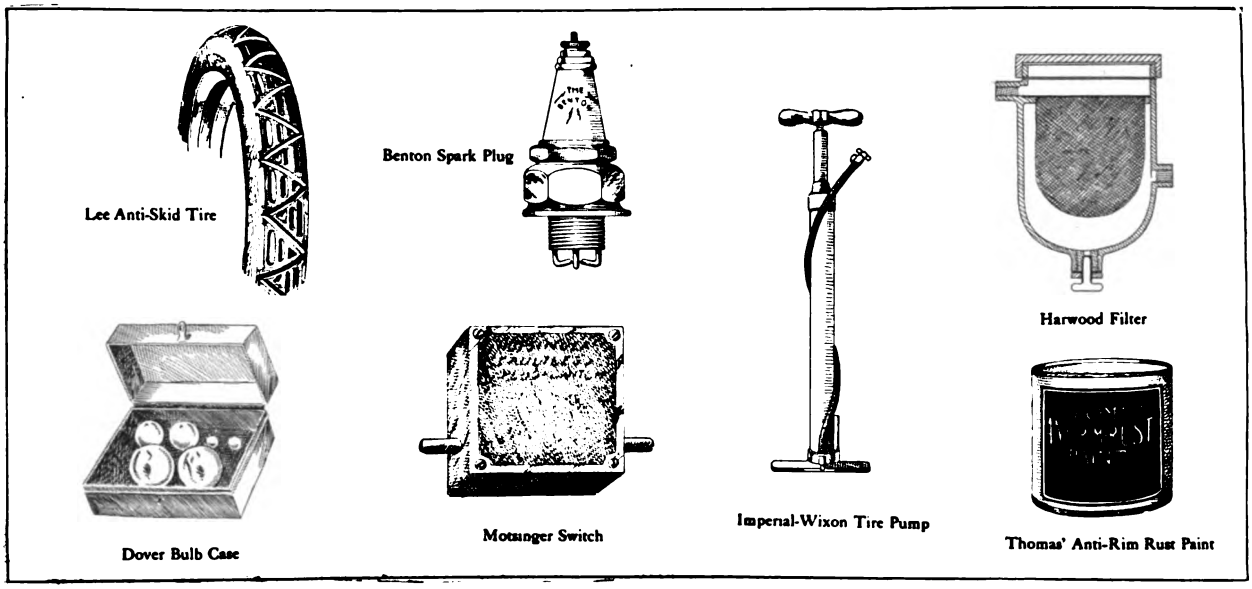
The A-1 metal polish is manufactured by the Chas. H. Rath Company, Inc., Philadelphia, and is distributed by the Bi-Motor Equipment Company, 180 Massachusetts avenue, Boston. It not only imparts a brilliant lustre to the metal on which it is used, but corrosion and rust are removed easily and with but little effort. One of the qualities emphasized with the polish is that the shine is enduring. It comes in quarter, half and one-pint cans, also quart, two-quart and gallon sizes.

Rubes Bulb Horn.



In some cities the laws require the use of a bulb horn as a signal and when touring it is desirable that one of these members be fitted to the car. The Automobile Supply Manufacturing Company, 224 Taaffe Place, Brooklyn, N. Y., is marketing the Rubes bulb horn, which has a clear, penetrating musical sound. The bell is oval, eight inches in height, and option is given on the straight or lyre bracket. The horn comes finished in black enamel or brass with the usual bulb and suitable length of flexible tubing. It is moderately priced.

Lee Zig-Zag Anti-Skid Tires.



The Lee zig-zag anti-skid tire is the product of the Lee Tire & Rubber Company, Conshohocken, Penn. A series of projections extends across the tread of the shoe and other protuberances are inserted between the zig-zag lines. It is held that the construction prevents skidding and that even after the middle studs are worn down the extreme ends of the zig-zag tread provide efficient traction. The shoe is built with the same high grade material and workmanship as the other products of this company.

Abell Air Starter.

The Abell air motor starter is marketed by the Standard Thermometer Company, 65 Shirley street, Boston. The pump, distributor and automatic clutch are combined and it is stated that it can be fitted to any type of gasoline car or motor. The air is stored in a tank by the pump and when the motor is to be started the fluid is led to a distributor, thence to the proper cylinder, forcing the piston down, much in the same manner as by the explosion of the mixture. A clutch is provided for operating the pump when desired and the equipment includes the necessary valves, connections, pressure gauge, etc.

Digitized by Google

Benton Spark Plug.

The Benton spark plug is called the case hardened plug, as the bushing into which the sheet mica insulator is forced is case hardened steel. The mica is spirally wound by a special process and it is stated that it will withstand extreme heats without cracking, etc. The electrodes are a heavy wire, drawn from a special alloy of platinum and nickel, and are held to be non-fusing and non-corroding. The porcelain is imported from Germany. A copper and asbestos gasket is spun on the bushing, making it gas tight when placed in the cylinder. The Benton plug is made in all sizes and types by the L. F. Benton Company, Vergennes, Vt.

Imperial-Wixon Tire Pump.

The Imperial Brass Manufacturing Company, Harrison street and Center avenue, Chicago, is marketing the new Imperial-Wixon triple-compression tire pump. The cylinders are triple, as is the compression, and the pump is of the double-acting type. The air is drawn in and compressed from the large cylinder into the space between the cylinders, and again compressed between other members. The final compression is by means of a check valve, central tube and hose to the tire. The first and third compressions are secured by the down-stroke, while the second is on the up-stroke. The pump is constructed of brass and is held to be very durable and efficient.

Harwood Filter.

C. F. Harwood, 516 Atlantic avenue, Boston, is marketing the Harwood filter, which is incorporated in the fuel line between the tank and the vaporizer. It comprises the conventional chamber in which is placed a removable basket filled with the filtering material. The fluid enters the vessel near the bottom, passes through the filtering element, and out through the top to the carburetor. All dirt, water, etc., falls to the bottom of the filter and may be removed by a petcock. One of the features of the device is that the basket may be removed and cleaned easily by unscrewing the cap. It is moderately priced.

Dover Bulb Case.

Among the new products of the Dover Stamping & Manufacturing Company, Cambridge, Mass., is the Dover bulb case, designed for the carrying of spare electric bulbs. The container is of steel, coated with baked-on enamel, and provision is made for six bulbs—two head, two side and two small lights. The tray is provided with slots into which the sockets set and by turning the lamps they are locked securely. The case is very compact and provision is made for the use of a lock.

Motsinger Switch.

The Motsinger Device Manufacturing Company, Lafayette, Ind., is marketing the Motsinger faultless plug switch, which is a two-way design and very neat and compact. A feature of the switch is that the usual swinging arm is eliminated, the plug being within the switch proper and is moved to right or left positions for contact and centre for neutral. Contact is made between flat phosphor bronze springs and the plug and the latter is so constructed that it cannot slip when in position. The plug is removable and when displaced prevents operation of the switch by cotter pins, wires, etc.

Thomas' Anti-Rim Rust Paint.

Rusty rims not only have a deteriorating effect upon tires, but they make it difficult to remove the shoes, especially if they have not been displaced for some time. The Anti-Rust Paint Company, Akron, O., is marketing a scientifically compounded metallic paint, containing para rubber and graphite, called Thomas' anti-rim rust paint, which prevents the gathering of rust on the rims, etc., and makes the changing of tires an easy task. The preparation is a liquid, easily applied and is very durable. A small sized can contains enough to coat eight rims and the maker states that it is but the work of a few minutes to clean the rims, bolts, etc., and apply the paint.

Planhard Carburetor.

Features of the Planhard carburetor, made by the Planhard Manufacturing Company, 1784 Broadway, New York City, and Kokomo, Ind., are the absence of springs, cams, levers, etc. It is of the concentric type, the float chamber surrounding the mixing chamber, and is designed in such manner that all joints are in a horizontal plane. A quality of the vaporizer is that it may be easily disassembled and replaced. Proper vaporization of the fuel and the operation of mixing it with the air is accomplished by a double concentric air and mixture construction. The fuel nozzle is in the centre and is entirely surrounded by the fixed or constant air tube. The auxiliary air is admitted through a series of ball valves which are seated in holes in an adjustable screw plate at the bottom of the auxiliary air tube. These seats vary in size, but the balls are all of the same size and weight and are lifted from their seats progressively as more air is required, the ball on the largest seat being raised first. This is held to eliminate fluttering and to make for smooth operation of the motor. The spraying nozzle is cup shaped, and when the motor is inoperative this fills automatically with gasoline to within a short distance of the top. This priming device makes for easy starting with the engine cold. The float chamber has a flooding device. Means are provided for adjustment of the air and fuel and these members are easily operated. Greater efficiency from the motor and economy of fuel are among the qualities of the Planhard.

Peck Wheel.

The Peck Wheel Company, 2008 West Jackson boulevard, Chicago, is manufacturing the Peck wheel, which employs an airless tire on a rim designed to yield to the inequalities of the road through a novel utilization of air.

Digitized by Google

Each spoke consists of a water and dust proof cylinder, in the centre of which is a piston terminating in a plunger. On each piston is a coil spring, which compresses as the piston plungers move in the cylinder spokes. In this manner the weight of the car and its load is held to be suspended from the upper arch of the wheel in that the operation is such that only the springs in the upper half are compressed. At the same time those in the lower half are relieved of their carrying compression, as the piston plunger passes into the cylinder and is driven against an air chamber at the head of each spoke.

Pyrene Fire Extinguisher.

Many disastrous fires in garages and on the road could have been prevented by extinguishing the blaze in its incipiency. Highly inflammable materials such as gasoline, calcium chloride, etc., when ignited result in a fire that cannot be extinguished with ordinary treatment. Extinguishers for service in the garage or on the machine must be adapted for immediate service and not subject to deterioration through exposure to heat or cold, etc. The Pyrene Manufacturing Company, 1385 Broadway, New York City, is producing the Pyrene fire extinguisher, which is very compact and weighs approximately five pounds. It extinguishes fires by the formation of an elastic non-poisonous blanket which separates the flame from the burning material. It contains neither acid, alkali, salts nor moisture and will not injure any material with which it is brought into contact. The liquid is not maintained under pressure, will not freeze and may be employed on all classes of electrical fires without danger to the user. Pyrene is a double acting hand pump, easily utilized, and the discharge is under the control of the operator at all times. It has been indorsed by insurance companies and a booklet will be mailed free upon request by the Pyrene Company of New England, 176 Federal street, Boston.

J-M Non-Burn Brake Lining.

The J-M non-burn brake lining is marketed by the H. W. Johns-Manville Company, New York City, and among its qualities is that it is impervious to the action of heat generated by friction in service. The lining is composed of asbestos, a very durable mineral, reinforced with brass wires, these being interwoven in each strand. It is held by the maker that water, grease or gasoline has no deteriorating effect upon the material and that it will lock the wheels instantly when the brakes are properly applied. It is made to fit any brake and any friction or transmission clutch. It comes in varying widths and thicknesses to meet individual requirements.

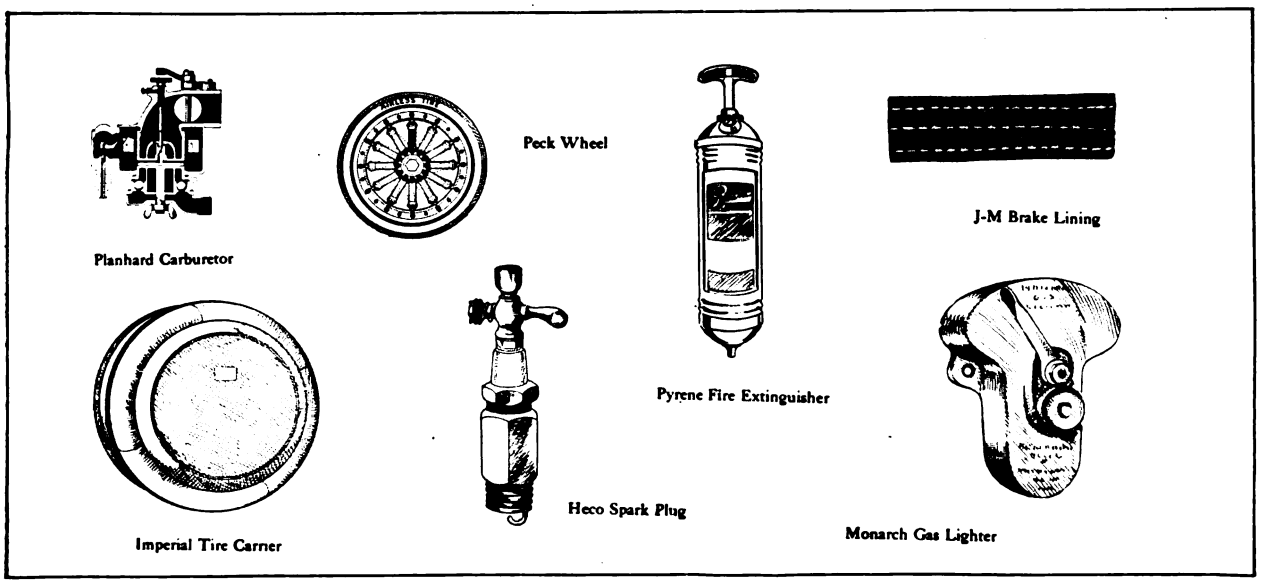
Imperial Tire Carrier and Trunk.

W. W. Winship, 71 Summer street, Boston, is marketing the Imperial tire carrier and trunk, which presents interesting features in that it is not only convenient and neat in appearance, but is water, dust, rattle and theft proof. It comprises a metal frame member which is the trunk proper, and being circular, serves to carry tires of any type or demountable rims. The shoes are slipped over the supporting member and are retained by a specially designed cover which is locked by a small lever. A simple movement of the latter permits of displacing the tires in a very short time. The locking mechanism is concealed from view and the entire construction is simple. The tire covers are noticeable for the ease with which they may be displaced or put on, and no straps, etc., are employed. Two types are produced, one for mounting on the running board, the other at the rear. With the latter provision is made for an electric rear signal in the centre of the cover, which does not interfere with the removal thereof.

Heco Priming Spark Plug.

One of several features of the Heco spark plug, manufactured by the Heinze Electric Company, Lowell, Mass., is that the cylinders may be primed for starting purposes. The priming cup is secured to the top of the main electrode and provision is made for attaching the usual terminal of the secondary cable. The central electrode contains a passage registering with the opening of the priming cup and a quality of the design is that the priming fluid passes directly to the spark gaps, insuring ignition of the charge, even with a weak spark. This makes possible starting under unusual conditions. The plug is not designed for winter service only, as it may be employed for introducing kerosene into the cylinders and for locating missing cylinders. It is constructed with the same care and of the high grade material for which the products of the company are noted.

Monarch Gas Lighter.



The Monarch gas lighter is designed for motor cars lighted by acetylene and is produced by the Benford Manufacturing Company, Mount Vernon, N. Y. It comprises a compact attachment for the dash, having a lever which is moved to light the lamps. A thumb control valve permits of extinguishing the lights. The pressure is automatically controlled and it is held to make for economy in that gas is not wasted by blowing. The Monarch gas lighter comes complete with Alco burners, wire, brass tubing, instructions, etc.

De Luxe Glass Cleaner.

Joseph J. McGuinness, Waterbury, Conn., is manufacturing the De Luxe glass cleaner and polisher, which is specially adapted for removing deposits from windshields, lenses, mirrors, lamps, etc. The maker states that it will not scratch the surface and does not contain whiting, oils, acids, etc., and that the polish imparted is lasting. The polisher is soaked in water, wrung out and the burlap side applied to the glass.

Korine.

Korine is manufactured by the James-Gray-Kuhn Co., Pittsburg, Penn., and is a carbon remover, which is placed in the cylinders and allowed to remain a few hours. It softens the carbon, which is displaced in the exhaust.

Digitized by Google

WITH THE MOTORING INTERESTS ABROAD.

Conditions Governing Proposed International Stock Car Race on Isle of Man—Studying the Fuel Problem in England—Other Foreign News Notes.

LESS than two years ago British motorists were discrediting the "stock car" races held in America. Last year two "standard car" events were held on the Brooklands track. Now comes the announcement of the Royal Automobile Club of an international "stock car" race to be held on the Isle of Man, Thursday, Sept. 25. The chief prize will be a cup to be known as the Tourist trophy.

Entries must be received by the club at the Club House, Pall Mall, London, S. W., before 12 noon, Monday, June 30, and the club reserves the right to refuse any entry without assigning a reason, to limit the number of acceptances as circumstances may require, or to cancel the race if there be less than 20 entries by 12 noon, Saturday, May 31. Entries must be accompanied by the manufacturer's or agent's catalogue, published prior to Feb. 17, 1913, and by an entry fee of £50 ($250) a car prior to May 31 and £75 ($375) after that date. Not more than three cars of similar design may be entered from the same manufacturer. The chief conditions are as follows:

The distance of the race, including controls (if any), shall be eight laps, or about 300 miles. The car completing the course in the shortest time shall be the winner, subject to compliance with the regulations, and the entrant of the car shall, on signing the bond and effecting the insurance required by the club, become holder of the trophy.

The race is for four-cylinder "stock" cars. The bore shall not exceed 90 mm (3.543 inches) nor the stroke 140 mm (5.512 inches).

Subject to these regulations the chassis must be of a standard touring design and construction in every respect, and must be shown in the manufacturer's or agent's catalogue published prior to Feb. 17, 1913. Any car which, in the opinion of the judges, is not a stock car, or which is specially designed for speed (although it may appear in the catalogue as above) will not be permitted to start.

The minimum weight shall be 2000 pounds (17 cwts. 3 qrs. 12 lbs.). This weight is the weight of the vehicle ready for the race; that is to say, as it will compete, including driver and mechanic, fuel, oil, water, tools and other appliances, spare tires or detachable rims or wheels with tires.

The chassis shall conform in all respects to the requirements of the British law. The bonnet and radiator cap must be used. All undershields, valve spring and tappet covers must be used.

The width of the body shall not be less than 40 inches to allow for two seats, measured from the outside. The dashboard shall be rectangular and not less than 40 inches in width, and 20 inches in height, measured from the level of the top of the frame.

All cars must be fitted with standard silencer and exhaust pipe, exactly as usually fitted to the car. An exhaust cut-out, however, may not be fitted, whether it is fitted as standard or not.

A cylindrical tank, with baffle plate or plates, not more than 40 inches in length and of such diameter as may be necessary to carry not less than 30 gallons of fuel, shall be carried. If placed transversely over the rear part of the chassis the whole of the tank shall be above the top of the frame. Either gravity or pressure feed may be used, and entrants may alter their cars in this respect.

The same make and size of carburetor as usually fitted to the car must be used. The adjustment of the carburetor may, however, vary from that usually employed upon the car. The induction pipe must be identical with that usually fitted.

The slope of the steering pillar may be altered to suit the type of body used.

No higher gear ratio may be used than the highest fitted as standard to the type of car entered.

Only wheels of a size specified in the maker's catalogue for the type of car entered may be fitted. Detachable wheels or rims may be used whether usually fitted as a standard or not. Covering discs may not be used. At least two spare tires, or two spare detachable rims or wheels with tires, shall be carried.

Efficient mudguards shall be fitted to front and rear wheels, and shall be flat and set without splay. The steps must be continuous with the mudguards. The width of the front mudguards shall not be less than 10 inches, and of the back mudguards and floorboard not less than eight inches. No part of any mudguard or footboard shall be less than eight inches from the ground when the car is fully loaded, ready for the race. The foremost part of the front mudguards shall not be behind the foremost part of the tires on the front wheels, and the hindmost part of the back mudguards shall not be in front of the hindmost part of the tires on the back wheels.

Shock absorbers may be used.

No means of conveying auxiliary oil to the engine or other parts may be used, such as increasing the size or number of feeds or using a hand pump, unless the latter is a standard fitting. Any oil container must be of the usual size and in the usual position.

The use of auxiliaries to combustion (other than atmospheric air), such as oxygen, acetylene, etc., is prohibited.

There will be one depot under the official supervision of the club, from which competing cars may obtain such spare parts, spare tires, fuel, oil and water, as they require; but such spare parts, spare tires, etc., must be lifted off the counter by the driver and his mechanic without assistance, mechanical or otherwise.

No other replenishment or replacement depots will be allowed, and no spares, fuel, oil or water may be taken up at any part of the course other than at this one depot. Any infringement of this regulation shall render the car liable to disqualification.

Only the driver and his mechanic shall be allowed between the start and finish of the race to effect any repair or replacement, or in any other way assist the car. The driver and his mechanic shall be the only persons on the car during the race.

INTERESTING BODY DESIGN.

One of the Recent British Attempts to Solve Problem of Attractive Lines.

If the British motoring prints reflect the desires of the motorists in Great Britain, there is a very general demand in that country for what is termed a more artistic treatment of the body work on automobiles. Several coach builders have made attempts to solve the problem as presented, but it must be admitted that there is a

Digitized by Google

wide diversity of opinion with respect to the designs thus far offered.

An accompanying illustration presents a six-seated sporting body recently produced by Charles Lane & Co., Ltd., 311 Euston road, London, N. W. The chassis is a six-cylinder Mercedes with disc wheels. There appears to have been decided effort to provide everything which might be required on a long trip, but there undoubtedly will be some question as to the means for entrance and egress.

THE FRENCH GRAND PRIX.

Event for Coupe de L'Auto Will Not Be Held Until Later in the Season.

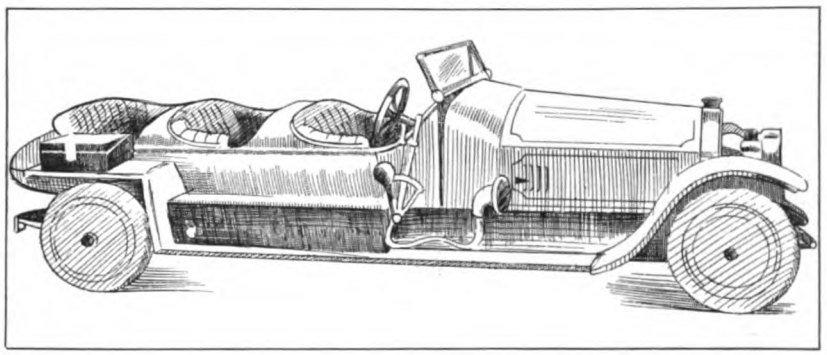
In the revival of the French Grand Prix last year, another event for small cars, termed the race for the Coupe de L'Auto, was held in conjunction therewith. This year it has been decided to hold the latter contest over the Boulogne circuit, Sept. 12. This course will be covered 14 times, making a distance of 452 miles. Already nine entries have been received, these including three Peugeots, to be driven by Boillot, Goux and Zuccarelli; two Delage cars, driven by Balot and Guyot, and four Koechlins.

The Grand Prix will be run over the Picardie circuit, July 12. The cars will start in the following order: Sunbeam, 1, Great Britain; Delage 1, France; Opel, Germany; Mathis, Germany; Excelsior 1, Belgium; Th. Schneider 1, France; Itala 1, Italy; Peugeot 1, France; Sunbeam 2, Great Britain; Delage 2, France; Excelsior 2, Belgium; Th. Schneider 2, France; Itala 2, Italy; Peugeot 2, France; Sunbeam 3, Great Britain; Th. Schneider 3, Germany; Itala 3, Italy; Peugeot 3, France; Sunbeam 4, Great Britain; Th. Schneider 4, Germany.

TESTING MIXED FUELS.

Several Interesting Experiments Have Been Made by Concerns in England.

At least two of the omnibus companies in London are operating cars with mixed fuel. The British Motor Cab Company is using a mixture of 40 per cent. kerosene and 60 per cent. gasoline, while the London General Omnibus Company utilizes a mixture of benzol and kerosene. The former concern says that the only alterations to the carburetor found to be necessary are a slight increase in the size of the jet and an enlargement of the air inlet somewhat. An auxiliary attachment on the dash permits of using gasoline for starting.



Southern Automobiles, Ltd., Blackheath, London, has been testing a mixture of one-third benzol and two-thirds kerosene with very satisfactory results, as indicated by the following report:

The car on which we conducted this experiment is a 14 horsepower Germain, now seven years old. The engine, although it is in fairly good condition, ought to have new pistons fitted. We have been using the mixture in an ordinary S. U. carburetor without any special vaporizer. We have, however, taken precautions to see that the whole of the jacketing on the carburetor is kept extremely warm, and the long induction pipe which is fitted to this type of car is so arranged as to be well and efficiently warmed.

The only difficulty we have experienced is in starting, and we have found that when the car has been left standing overnight the benzol appeared to separate somewhat from the kerosene. We found we could get over the difficulty by fitting a tap so arranged as to draw a small quantity of benzol from the top of the tank for starting purposes, and after the car has been running, to change the supply over to draw from the lower portion of the tank, as the vibration of running is sufficient to keep the fuel mixed.

With regard to carbon deposit we have never experienced any difficulty in this direction, either with benzol only or the mixture of benzol and kerosene, except in cases where the carburetor was obviously at fault. The normal amount of deposit has proved to be not more than when gasoline has been used.

We have during the last few days been experimenting with a still cruder fuel in the shape of a by-product obtained in the production of naphthaline; this we find mixes with benzol in equal proportions and works quite satisfactorily.

Interesting Body Installation on a Six-Cylinder Mercedes Car, Produced by Charles Lane & Co., of London, England.

In this connection it is interesting to note that a company has been formed in Brussels for the production and introduction of a new motor fuel, known as La Perosine. This is described as consisting of "petroleum free from excess of carbon and constituents detrimental to its combustion." It is held to give off no smoke or deposit, and to require no modification of the carburetor.

NYBERG IN RUSSIA.

American Car Meets With Decided Success in Military Work in That Country.

Several American machines are being used with decided satisfaction by army officials in Russia. During the official trials of last summer cars made in this country secured awards in competition with the best that are produced on the Continent. Among the successful contestants was the Nyberg Automobile Works, Anderson, Ind., one of its vehicles winning the royal road race.

As a result of this event the machine was purchased by the war department and placed at the disposal of Count Nicholas Kouznetzoff, who is shown at the wheel in an accompanying illustration. The photograph was taken on a military

Count Nicholas Kouznetzoff of the Russian Army at the Wheel on a Nyberg Car Near St. Petersburg.

road, just outside of St. Petersburg, during a recent tour of inspection. Incidentally, it presents a very good idea of the character of the roads in that portion of Russia.

AWARDS IN SWEDISH TRIALS.

Several American Machines Finish Stockholm-Gothenburg Run With Perfect Scores.

Seventeen contestants for the Winter cup and four for the Gothenburg trophy out of a total of 66 in both classes covered the 717 miles of the annual winter trials of the Royal Automobile Club of Sweden, from Stockholm to Gothenburg and return. As a result the work of the committee in arriving at a decision as to the winners of the two chief awards was no easy task, but the following results were announced at the annual dinner of the club last month:

Class 1.

The Winter cup, the Royal Automobile Club gold placque and the Dunlop prize to Hans Ostermann, Minerva. Gold placques to the following perfect score cars: Enderlin, Minerva; Paulmann, Horch; Joerns, Opel; Svensson, Scania-Vabis; Hogman, Hupmobile; Lindstrom, Scania-Vabis; Eck, Pope-Hartford; Huttenberg, F. A. B.; Janek, Fiat; Johnson, Overland; Holmer, Overland; de Mare, Cadillac; Schurmann, Fiat; Johansson, Cadillac; Enander, Mercedes; Thissell, Horch. Special prizes for cars completing without loss of marks, but with variation between schedule and actual running time: Oklund, Opel; Akerman, Hudson; Raaf, Horch.

Class 2.

The Gothenburg cup to G. C. Karlsson, N. A. G. Darling. Gold placques to following perfect score cars: Fogelkvist, Overland; Neilsen, Hupmobile; Westergren, Presto.

NOTES FROM FOREIGN LANDS.

New Zealand claims to have the largest fleet of motor postal vehicles in Australasia. The last horse was sold from the postal department's stable early in December.

During 1912 the Imperial Automobile Club of Germany erected 176 warning signs at dangerous crossings on the roads of that country, 369 signs to indicate level crossings and 672 boards at dangerous turns.

At a meeting of the French Chambre Syndicate de l'Automobile last month it was voted to hold the 1912 Paris Salon in October instead of December, and that its duration be 10 days instead of 16, as formerly.

Part of Lord Kitchener's policy in Egypt is the construction of trunk roads by convict labor. The new Alexandria-Cairo road, 130.5 miles in length, will be opened in the near future with suitable official ceremonies.

Country Life of England has offered a cup valued at $250 for the best electric lighting system to be installed on motor cars. The prize will be awarded by the technical committee of the Royal Automobile Club of Great Britain at a certified trial in the near future.

John Burns, president of the local government board in London, England, has arranged for a series of experiments at the National Physical Laboratory to ascertain how far it may be practicable to frame regulations prohibiting the use of dazzling headlights on automobiles.

A customs circular issued by the Russian ministry of finance provides that automobiles which have been in use and are the property of foreigners entering Russia to reside, or of Russian subjects returning home after a prolonged residence abroad, may be regarded as household effects and admitted free of duty.

A British concern is marketing a reflex mirror for use on horse drawn vehicles. The action was taken because it was suggested that owners of horse wagons often refrained from fitting red lights on account of the expense involved. The mirror is expected to reflect the rays of a motor car headlight and obviate the necessity for the red light.

A wire stretched across the roadway level with the heads of motorists caused the death of Rudolf Plunz and wife while enjoying an evening ride near Berlin recently. Another car following was stopped just in time to avoid a similar fate. Since this accident an attempt at a like outrage was reported from another section of Germany. The authorities have offered a reward of $1125 for the apprehension of those who were responsible.

The department in charge of taxing motoring cars in France has adopted a new formula for this purpose, as follows:

$$P = KnD^2LV$$

in which P represents horsepower, n the number of cylinders, D the bore in centimeters, L the stroke in centimeters, V the revolutions a second, and K one of the following coefficients: Single-cylinder engine, .0002; two-cylinder, .00017; four-cylinder, .00015, and six-cylinder, .00013.

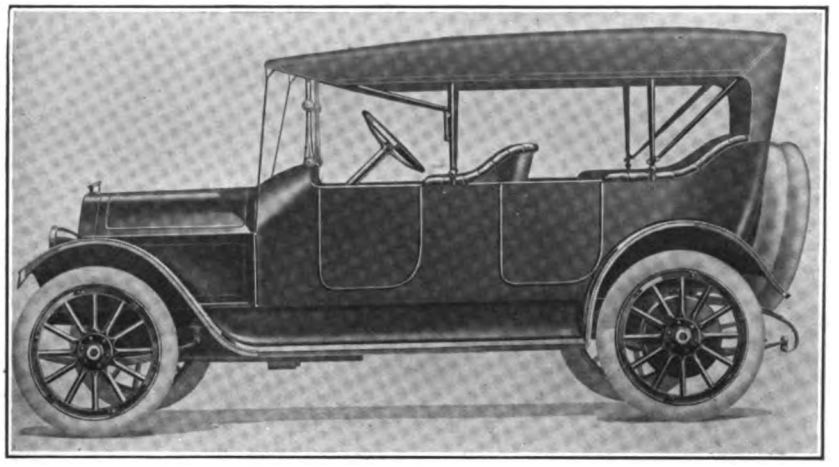
THE NEW TRIBUNE TOURING MODEL.

ANNOUNCEMENT is made of a new concern of Detroit business men, headed by Louis G. Hupp, which will build a new car to be known as the Tribune. The Tribune Motor Company is located at 807-815 Scotten avenue, Detroit, but it is planned to erect a large factory in the neighborhood of the Ford plant. For the present the company will produce a five-passenger touring car, fully equipped, including electric lighting, but later the line will be augmented by a roadster, limousine and other types. Louis G. Hupp is well known to the industry and associated with him are men of means.

The motor is a Buda of the L head type and the four cylinders have 3.75-inch bore and 5.5-inch stroke, which places it in the long-stroke class. It has a piston displacement of 234 cubic inches and is rated at 35 horsepower at 1500 revolutions a minute. All bearings are ample in size and are easily accessible without dismounting the crankcase. The valves are large and enclosed by removable plates.



The magneto and water pump are located at the left on brackets cast integral with the upper half of the crankcase, and a Bosch dual type of magneto is fitted. Lubrication is by force feed, the constant splash level system being employed, and the oil reservoir is located in the lower crankcase, which is aluminum. All spring, radius rod and torque arm bolts have grease cups which force the lubricant through a hollow core in the bolt to the wearing surface.

The clutch is a multiple disc, lined with Raybestos, which may be operated in oil or run dry. A Brown-Lipe transmission, providing three speeds forward and reverse, is bolted to the rear of the crankcase through a flange. The gears are of chrome nickel steel, mounted on Timken roller bearings and the ratios provided are: High, 1:1; medium, 1.76:1; low, 3.35:1; reverse, 4.32:1.

Standard Timken front and rear axles are employed, the latter being of the floating type with five-pitch bevel gear and pinion. The driving gear is riveted on the differential, following the usual Timken practise. A grease retainer is provided in the shape of a tube extending from the brakes to a point close to the differential. The bevel gear, pinion and differential are accessible through a removable cap on the housing and the axle shafts are splined.

The steering gear is a Gemmer, located at the left—a worm and gear with ball bearings. The spark and throttle controls are mounted on a 17-inch wheel. The gearshift and emergency brake levers are in the centre. Two sets of brakes are fitted, the service being of the external contracting type actuated by pedal, while the emergency are internal expanding, operated by the conventional lever. Raybestos is employed as a lining.

The front springs are semi-elliptic and rear full elliptic. Both are liberal in size and well supported. The frame is of the usual channel section with single drop and is braced by three cross members. The wheels are second growth hickory fitted with 32 by 3.5-inch non-skid tires.

The New Tribune Five-Passenger Touring Car, to Be Built by a Company Headed by Louis G. Hupp.

The body is well designed and very roomy, the front seat being 41 inches wide, while the space between the dash and cushion is 30 inches. The rear seat is 47 inches wide and ample leg room is provided by a space of 28 inches. The fuel tank has a capacity of 10 gallons, with an eight-gallon emergency tank under the cowl.

The upholstery is deep and comfortable and all trimmings are nickel plated. The top is a four-bow Pantasote with curtains, etc. The equipment is very complete, including windshield, speedometer, robe and foot rail, electric horn, tools, jack, pump, etc. A feature of the lighting system is the absence of the usual side lamps. The headlights are fitted with two sets of bulbs, one being utilized for city driving and the other and larger for country work.

MECHANICAL NOTES FOR OWNERS.

Proper Treatment of the Circulation System After Removing Anti-Freezing Solution---Care and Adjustment of Magnetos---Valve Repairing Tool.

IT IS now safe to remove the anti-freezing solution from the radiator, but the operation imposes duties upon the motorist other than merely opening the drain cocks, removing the fluid and refilling the cooler with clean water. Few give that attention to the circulation system that it deserves. As much of the efficiency of the motor depends upon the proper radiation of the heat developed by the explosions, care should be taken to maintain the radiator at its maximum efficiency.

It will be surprising to note the color of the anti-freezing solution, especially if it has been in the radiator for any great length of time. It will be seen that the fluid is a brick red in color, which some think is due to rust. It is caused by

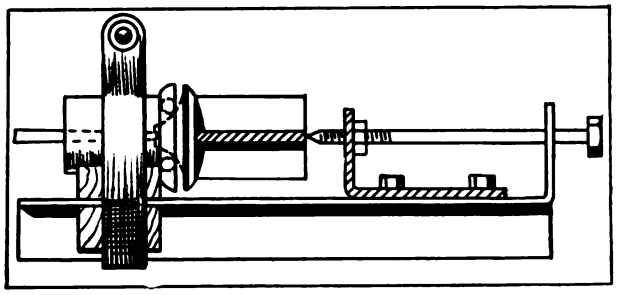
When Soldering the Radiator It Should Be Laid Flat on a Smooth Surface to Prevent Injury to Fins.

the use of hard water, which forms a boiler scale and which is deposited in the cooler in the form of a fine, brick colored powder. While radiator makers advise the use of distilled water, the expense and trouble involved are such as to cause the owner not to heed the recommendation.

The circulation system must be cleaned before refilling with fresh water. Before draining off the anti-freezing solution, dissolve as much common washing soda crystals in water as the latter will absorb. Next open the petcocks or drain plugs under the radiator, pump, etc., and after the old fluid has run out close the petcocks. The system is now ready for the soda solution, enough of which should be prepared—five gallons for example, if that is the amount of water employed. Pour the mixture into the radiator and start up the engine, allowing it to operate at a slow speed for a considerable period. If the old solution shows much discoloration it is best to take the car out on the road and run it for a couple of hours to make sure that all the encrustations are loosened.

Next remove the soda solution by opening the petcocks, after which refill with clean water and again run the engine for a few minutes. Remove the water and note its color. If dirty, refill and repeat the operation until the fluid is clear. Another method is to open the petcocks and with the motor running feed fresh water into the radiator, just enough to replace that which is running out at the petcocks.

Before putting away the hose clean the exterior of the cooler. It is just as important that the fins or tubes be kept clean as to remove deposits from the interior. This may be accomplished by using the hose and directing the stream of water from the back of the radiator, not the front. Allow the water to flow slowly at first to loosen all dirt, etc., and it is a good idea to cover up the magneto during the operation. Playing the hose on the front of the cooler is likely to flood the magneto and create trouble.



Small leaks may develop that did not show during the winter. If so they should be repaired and unless one is familiar with the work of soldering a cooler it is best to have it done by an expert. However, if the leak is a tiny one, the owner may attempt the repair. The cooler should be laid flat, as shown in an accompanying illustration, and must be handled carefully at all times. In replacing the retaining nuts should not be set up so snugly as to strain the studs.

If the cooler is painted black and the fins are exposed, it will improve its radiating qualities by coating with a black paint, one especially prepared for the work. Do not use other paints as black has greater radiating virtues. The paint employed should be very thin.

If glycerine has been employed in part as an anti-freezing solution, it is an excellent idea to examine the rubber connections to note if the material is in good condition. Sometimes the fabric separates and impedes the flow of the water, creating heating troubles, which are attributed to other sources. If the tubing appears to be de-

Digitized by Google

teriorated in any way, throw it away and fit new. If the fan has been removed it should be replaced and the tension of the belt adjusted. Clean and

A Valve Trueing Tool That May Be Constructed Easily and at Slight Expense.

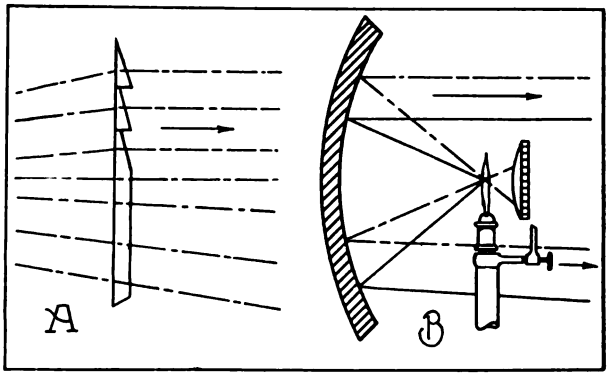
refill the grease cups on the bearings and set up all nuts and bolts.

VALVE REPAIRING TOOL.

After considerable wear valves will require trueing. Usually this work is taken to the expert, although it may be performed successfully by the owner provided he has the proper equipment. As many motorists care for their cars and are handy in constructing devices aiding in the work, the following suggestion for making a valve trueing machine will prove of value.

The device is shown in an accompanying illustration and its bed consists of a piece of three by three-inch angle iron about 20 inches long and .375 inch thick. At one end the webs are cut off, and the end bent up at right angles for about three inches. The fast headstock is made from an old steering pillar ball race taken from a scrapped bicycle or purchased at some bicycle repair shop.

The headstock rests on a wooden block hollowed out to suit the height and diameter of the ball race. The entire headstock is clamped together by a piece of one-inch by .25-inch iron, bent and drilled to take a .375-inch bolt, as shown in the drawing. The tailstock is made up of a piece of .375 by nine-inch flat iron. This is drilled to suit the height of the headstock and is also bent over and tapped to take a .625-inch centre screw, which is fastened down by two three-inch screws.



The valve to be trued must have a slot cut in the stem, similar to that used for holding the screw driver when grinding, and should be placed up against the race as shown in the sketch and the back centre screwed up. The balls in the race are retained in position by the use of tallow or hard grease. A bitstock with a screw driver may be employed for rotating the valve, one person doing this work while another trues up the valve with a hand tool which may be made from an old file. A true surface can be cut by this method and the device will accommodate a number of differently sized valves.

ANTI-DAZZLING LENS.

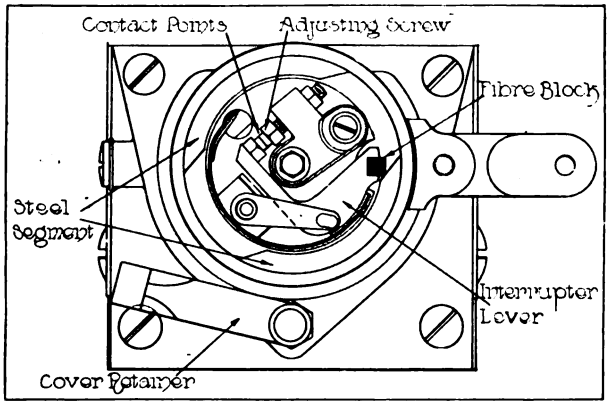
Anti-dazzling devices to remove the dangerous glare of the headlights are beginning to receive attention in this country and at the recent shows two designs for this purpose were exhibited. One is attached to the windshield, while the other comprises a curtain which is utlized when desired for dimming the lights. A well known English lamp maker has produced two improvements for headlights, one of which is said entirely to eliminate the dazzling without decreasing the efficiency of the light. Both are utilized, however, and in an accompanying illustration are shown the devices.

The Anti-Dazlo consists of a built-up lens, by which the upward projection of the rays is substantially prevented within the limit in which the intensity of the light would be such as to produce a glaring effect on the observer. The lens is formed of a number of strips or prisms of glass of properly determined dimensions, disposed horizontally, polished on their upper surfaces and finely ground on the lower. These are cemented together, and the lens is optically ground and polished as required.

The effect of this construction is such that the rays of light which strike obliquely against the internal upper surfaces of the strips or prisms are deflected downward, while those that strike against the lower internal surfaces of the prisms

Eliminating Dazzling Rays of Headlights: A, The Anti-Dazlo Construction, Showing How Upward Rays Are Diverted to Horizontal; B, Dublito Intensifier Which Increases Efficiency of the Flame.

are absorbed. The rays are shown at A. Tests made in a fog demonstrated that the driver of the car could see for a considerable distance by



Digitized by Google

reason of the fact that he looked over the beam and not through it as with the conventional types of headlights.

Incorporated with the lamp is the Dublito intensifier shown at B, and which is claimed to increase the efficiency of the light by over 50 per cent. It is a small lens mirror or refractor placed in front of the flame so that when looking straight into the lamp the blaze is obscured. The mirror is mounted on a support attached to the bracket retaining the burner, as shown in the sketch, and the rays from the front of the flame fall on the main reflector, thus intensifying the beam thrown therefrom. The result is similar to that obtained when standing between two mirrors, the object being reproduced.

CARE OF THE MAGNETO.

It may be truly said that the magneto is a perfected instrument and this contention is borne

Illustrating Components of Breaker Box of Bosch Magneto.

out when it is considered that thousands are used and give perfect satisfaction. It is rarely a magneto gives trouble and when it does invariably it is because the instructions of the maker are not complied with. Grit and dirt are the greatest enemy of the instrument and when it is so mounted on the power plant that road dust, etc., can find their way to the magneto, it should be protected by a leather or suitable cover. The latter are not expensive and may be purchased at any supply house.

The attention of the writer was called to a magneto by a repairman to whom the car had been brought and the magneto condemned as faulty. The instrument was covered with mud and grease, and the breaker box was fairly plastered with the mixture. Upon removing the cover the trouble was quickly located. The little fibre block set in the interrupter lever was so badly worn that its contact with the segments was not sufficient to cause the platinum points to separate. Consequently the primary current could not be broken, either from the magneto or from the batteries. The cause was manifest. The dirt had worked into the breaker box, depositing an abrasive which gradually cut the fibre, as was indicated by the fibre dust in the box. Upon cleaning the magneto and replacing a new fibre, the instrument was as good as ever.

The components of a Bosch breaker box are shown in an accompanying illustration with the parts marked. By studying their operation one should be able to detect trouble and the information will be of value when on the road. It will be seen that the fibre block is mounted on what is termed the interrupter lever, which also carries a spring for the purpose of keeping the platinum points in contact. The lever being pivotally mounted the points are separable when pressure is applied to the fibre block. The entire construction is attached to the armature shaft and revolves with it. The breaker box housing has two steel segments which may be described as a ring with two pieces cut out. When the lever is in such position that the fibre block is in the cut-out section, the points are together, but when the shaft rotates further, the fibre meets an obstruction and the natural sequence is that it is moved inward. This breaks the contact between the platinum points and a contact is remade when the fibre reaches the second cut-out section between the segments.

One platinum point is fixed, the other is adjustable, and by loosening a lock nut the screw may be moved in or out as required. The proper distance should be about .5 mm and the points should be set with a Bosch wrench, which should accompany each instrument.

It will be seen that it is a simple matter to remove the breaker box cover and by having someone crank the motor slowly it can be determined if the points are separating. If not they should be adjusted. The interior of the breaker box should be kept clean, but not oiled, as any lubricant will swell the fibre and create trouble. Clean out the box with a soft brush, taking care to remove any dust or grit. The same treatment will apply to the distributor. Outside of this work and oiling the bearings according to instructions, there is nothing the novice should do, although if the brush springs have lost their tension they may be stretched.

There is nothing mystifying about a magneto and a little study of its operation will enable the motorist to overcome simple troubles. The latter are generally caused by lack of attention.

Digitized by Google

EQUIPPING THE PRIVATE GARAGE.

Part VI.

WITH the tool equipment specified in the previous installments and supplemented by such special members as may be necessary for the car, there is no reason why the overhaul of the machine cannot be successfully completed. There are many owners who install a small lathe operated by electricity or a small gas engine, but these understand the operation of machinery and are as capable of making repairs as the expert. Unless there is considerable metal drilling to be done it would hardly pay to invest in an electric drill, although it could be employed for polishing by fitting a buffing wheel. There are numerous labor saving devices operated by electricity such as tire pumps, etc., but the average owner is satisfied with an ordinary equipment, relying upon the machine shop for difficult work.

Preparing for the Overhaul.

It is customary to partially or completely overhaul the car in the early spring, the amount of work to be done depending upon the age of the machine and the amount of service it has seen since the previous renovation. While a number of owners complete the work during the winter months, there are many whose garages are not heated and who are obliged to wait until warmer weather.

When working about the machine good clothes should not be worn and the best plan is to wear an old suit, over which should be fitted overalls and a jumper. There is a one-piece suit made by the Detroit Overall Company, Detroit, which is constructed of heavy pin denim that may be slipped over the clothing and buttoned snugly, so that the motorist is protected fully, no matter what may be the work. It is closed tightly at the collar and wrists and has four pockets which make for convenience. It has an advantage over overalls and jumpers in that when crawling under a car the one-piece construction does not separate as does the other form. An old suit may be worn, however.

A pair of old leather gloves with the finger tips cut off will protect the hands, especially if the skin is soft, and if a wrench slips one is not so apt to receive a cut or a bruised knuckle. Cotton gloves may be employed, but the leather members are superior.

Value of Boxes.

A number of boxes for nuts, bolts, etc., are necessary and one or more of these members should be large enough to contain parts. By being systematic in the arrangement of the parts the work of reassembly will be greatly facilitated. It is poor practise to dump all the material in one or two large boxes, as considerable time is lost in searching for the desired nut or bolt.

There should be plenty of waste. Old cloths will do, but a can should be located outside of the garage in which the greasy rags should be placed because of the danger from spontaneous combustion. If the equipment does not include a motor washer, a couple of cans with stiff brushes will serve and there should be a supply of gasoline and kerosene for this work. As the fuel tank should be emptied and cleaned in the overhaul of the car, its contents can be utilized.

If the tools have been in service for some time they should be gone over and examined and any damaged members replaced with new or repaired. Cold chisels, drills, etc., may require resharpening and it is possible that some of the files will be badly worn. The list of supplies should be checked up to make sure that needed material is on hand as considerable time will be lost otherwise.

A useful tool for cleaning the chassis is a painter's putty knife, as with it much of the superfluous grease may be displaced from the chassis. It is a good plan to have an old can handy in which the scrapings may be deposited.

A creeper can be made or purchased.

If the equipment does not include a falls and tackle it will be an excellent plan to secure two light pieces of joist about five feet long and by covering each end with cloth they will prevent injuring the body when it is removed on these members. A number of blocks will be decidedly useful in connection with the pieces of joist, especially if the rear system is to be removed for an overhaul.

The method of constructing motor and rear axle stands has been outlined and if these have not been prepared they should be if the overhaul is to include the motor, etc. As previously mentioned, a pair of horses can be utilized, but a motor stand is more convenient.

(To Be Continued.)

Ed. Note—The next installment will deal with the disassembling of the motor car and the various steps will be illustrated by photographs. It is suggested that the owner study thoroughly the instruction book and familiarize himself with the components of the machine. This will be of decided value in the overhaul.

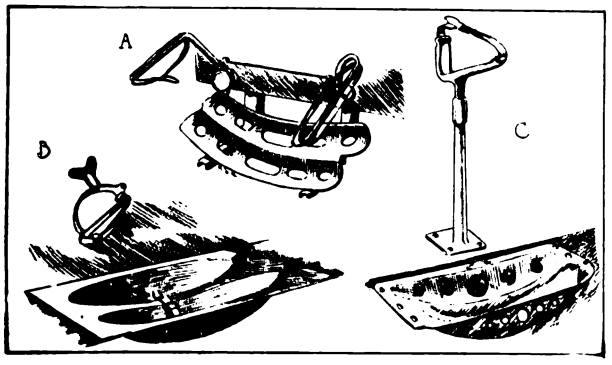
THE PROBLEM OF GOOD ROADS.

Seventy-five per cent. of the products of this country must pass over the public highways before they can be transported over the railway and water systems. In the face of this assertion, which is based upon the investigations of those best qualified to make deduction, it hardly can be contended that the problem of good roads is one which affects the motorist alone. Yet whenever the subject is broached in legislative circles it is followed by some scheme for securing additional money from automobile owners for highway betterment.

It is contended, whether rightly or wrongly, that the more swiftly moving motor vehicles cause a large share of the damage to existing roads and occasion the necessity for the expenditure of larger and larger sums each year. Leaving aside the merits of this controversy, it must be conceded that the transportation of the future, insofar as the public highways are concerned, will be done by automobile. And since this becomes an economic proposition, in which the entire public is directly or indirectly concerned, it follows that the time must come, sooner or later, when the subject of good roads must receive scientific attention.

Millions have been expended and millions more have been appropriated for the construction and maintenance of permanent ways. Engineers have given the problem serious study and are in a position to make valuable suggestions. But still the results do not appear to be such as might be expected.

It is true that there is much that ought to be done, and perhaps a mistake has been made in trying to do too much. By this is meant that there may have been an attempt to cover too much ground with the funds available, with the result that it has been impossible to build sufficiently well in the first place, and that the demand for additional improvements in other localities has been so insistent that it has been found somewhat difficult to give the new road the attention it deserved following its completion. The present need seems to be for a wiser application of the funds available. The motorist is interested, if only to the extent of being assured that the money he contributes in registration and license fees is utilized to the best advantage.



The French manufacturers have decided to hold the Paris Salon in October instead of December, but conditions with respect to the sale and use of motor cars in France are not exactly parallel with those in America. Boston dealers maintain that the time to sell machines is when the people are ready to buy, and insofar as shows in America are concerned Boston still appears to have the best of the argument.

It is understood that the proposed international stock car race on the Isle of Man was organized by the Royal Automobile Club of Great Britain as the result of a suggestion made last November by Hon. Arthur Stanley that a joint race meeting between American and British machines would prove a valuable test of the relative merits of the cars produced in the two countries. The club has issued the challenge in another form than was originally intended, but it will prove of interest to note how it is met by American manufacturers.

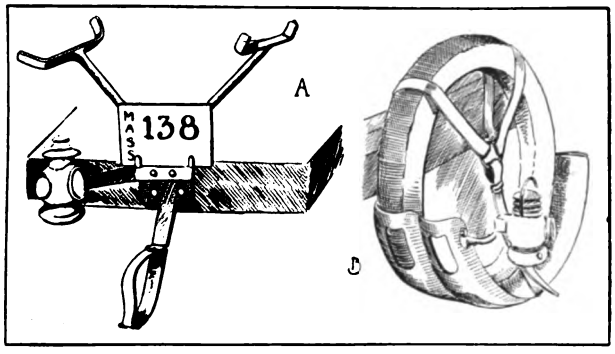
RECENT DEVELOPMENTS IN TIRE HOLDERS.

THOSE who have given the subject of body design more than passing thought cannot help but realize that the changes of the past few

Three Basket Design Tire Carriers: A, at Rear of Chassis on Marion; B, on Right Running Board with Pierce-Arrow; C, in Combination with Upright on National Roadster.

years have resulted in innovations that may be regarded as making for comfort and convenience. Departures from accepted practise have been less pronounced in this country than is true of some of the latest creations abroad, yet there has been a well defined tendency toward a simplification of the care of the machine and a more thorough enjoyment of its possibilities.

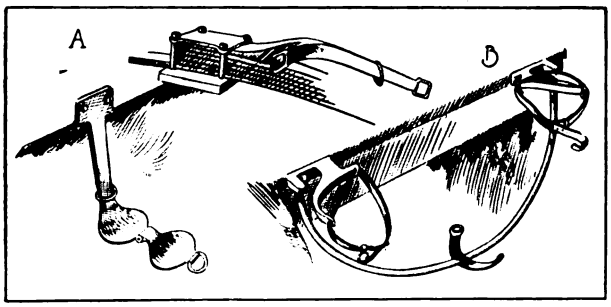


Particular attention is drawn in this instance to the matter of carrying the extra tires. Perhaps the spare wheel might be included, as well, although the use of the demountable wheel, whether of the wood or wire type, hardly has reached that point where it may be regarded as general. Undoubtedly this will afford a further opportunity for the designer within a comparatively short time, especially if wire wheels are to enjoy the wide popularity expected of them by their most ardent advocates. Already there are a few American car builders who are utilizing demountable wood wheels, and one of these has been offering this as standard equipment for at least two seasons.

The tendency toward a clean running board, the fitting of fore doors and the change of the driver's location from the right to the left side of the car have all played their part in bringing about the present arrangement of tire carrying devices. Formerly the tire holders were considered as an accessory, and when they were at first supplied by the car manufacturer it was solely with a view to furnishing an equipment which would meet with the approval of the owner.

The place of attachment was generally at the right side, one of the holders being extended from the dash at the end of a stout rod, another from the side of the front seat at the end of another rod, and the third including a strap on the running board. Inasmuch as the position of the gear shift levers, with the driver at the right, precluded the possibility of utilizing this side of the machine for entrance and egress, apparently it was conceded that the tires might as well be located at this point as anywhere else. But the combination of tires and levers could hardly have been regarded as ideal from an artistic viewpoint, and it had its disadvantages in a practical way in that under some installations at least the top was insufficiently supported.

The fitting of fore doors and the placing of the levers inside the car served to relieve the appearance, and presented the additional advantage of affording opportunity for so locating the supporting fixtures that the tires were maintained somewhat more rigidly. This has been carried a step further by the insertion of a plate carrying suitable indentations in the running board, the design employed on the Pierce-Arrow being an example. This construction has been utilized very liberally abroad, and several concerns in this country have adopted it this year.

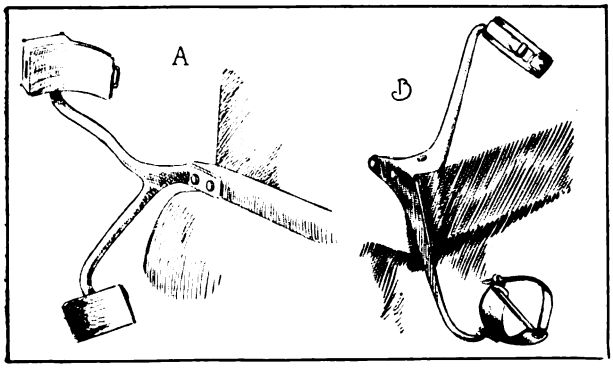


While it would appear that many makers were placing the tire carriers at the rear, a careful analysis of the situation will reveal the fact that by no means all have decided in favor of this proposition. It has been maintained that the rear location was more general with roadsters than touring cars for instance, but this statement is not altogether true either. There still remains a

A, Spider Arrangement Caring for Rear Light at Number Plate on Mercer Roadster; B, Chalmers Basket and Rear Light Attachment.

wide diversity of opinion among designers, and the rear location has not entirely passed the innovation stage.

Digitized by Google

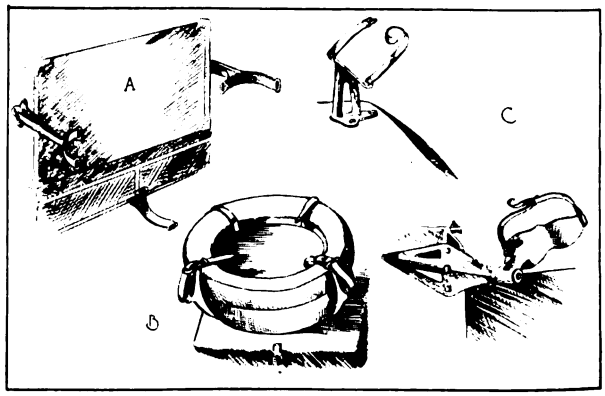


Strap at Spring on Haynes at A; Curved Rod Design on Fiat at B.

One of the arguments in favor of placing the driver at the left is that of affording opportunity for entrance and egress for the passenger directly at the curb. Some car manufacturers who have not cared to adopt the left hand drive have located the levers in the centre, thereby recognizing the desirability of having the side of the machine nearest the curb entirely free of obstructions. Obviously this has made it necessary for the designer to select some other location than the running board for the extra tires.

The object of this discussion is to point out some of the innovations, rather than to make suggestion as to the desirability of adopting either location. It will be noted, however, in the examples selected, that advantage has been taken of the opportunity to place the tire holders upon the chassis components rather than the body, in many instances.

The designer of the National appears to be undecided in the matter. The National is now driven from the left side, and it follows that the tires are carried at the rear, but three separate constructions are offered. That selected for presentation herein utilizes the same basket effect as seen on the Pierce-Arrow, but instead of being located in the running board, the basket is attached to the rear of the chassis frame member, from the top of which extends an upright, bolted



Two-Pronged Carriers at Rear: A, Marmon; B, Columbia-Knight.

at its base, and with a holder and strap at its upper extremity.

The basket idea also is to be found on the Marion, but in this instance the basket portion is carried on a pair of rods which extend below and toward the rear from the chassis frame member, while the upper supporting straps are attached to another set of rods extending upward from the same frame section. In addition, the rear light is so placed that the spare tires completely protect it from damage.

On the Mercer roadster, provision is made for carrying the rear light, license plate and tire holders at the same point at the rear, the tire carrier proper being in the form of a spider rigidly bolted to the chassis frame. Still another application of the basket is found on the Chalmers, also at the rear, and with this the rear light is attached to the outward portion of the basket by a suitable bracket.

The Fiat carrier is of one-piece construction,

Three Neat Attachments on the Roadster Body: A, in Combination with Trunk on Stuts; B, on Rear Deck of Pope-Hartford; C, Rear Deck Arrangement on Cole.

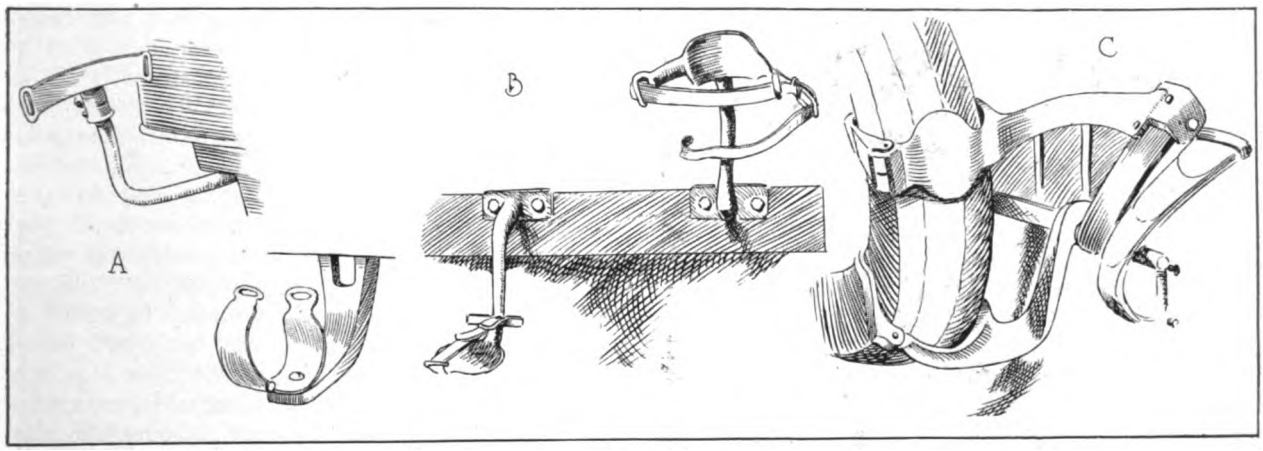
the two side holders being securely bolted to the chassis frame. From these a long curved rod extends below the frame, carrying at its centre a suitable support for the base of the tire. The Haynes offers another decided contrast, in that two brackets extend below the chassis frame, one on either side of the car, while the sides of the tires are held in place by straps attached to a metal bar, virtually forming a portion of the spring pad and bolted with the spring itself.

The Inter-State and the Pullman each make use of three separate brackets bolted to the chassis frame, the centre bracket in each instance extending downward, while the others take a more upright position. While the principle involved is similar, its method of working out is individual with each designer. The Marmon and the Columbia-Knight each have a two-pronged carrier at either side at the rear. In the

Digitized by Google

former instance the carrier is bolted on the rear portion of chassis frame member, while in the latter it is bolted at the top and side. The Winton uses two separate brackets at either side at the rear, one of these, the upper, being attached to a chassis side frame member and the other depending from the rear frame member.

But not all of those who favor the rear location make use of the chassis as a means of attachment. It is contended that this arrangement possesses certain advantages, particularly where it is desired that the body work shall be as free as possible from encumbrances. However, the main object of the designer is to consider the comfort and convenience of the occupants of the machine. And it cannot be said that artistic attachments detract in the least from the beauty of the car.



The use of the rear deck on roadsters is now regarded as accepted practise. The example of the Pope-Hartford, cited herein, will indicate one of the many attractive arrangements of this character. The top of the deck serves as well as the cover for a substantial luggage compartment.

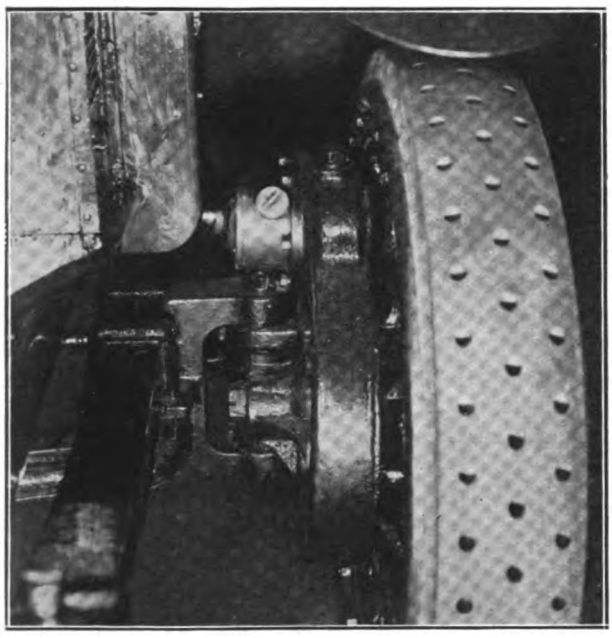
The Stutz roadster offers a variation, in that the side holders are securely bolted to the trunk at the rear, while the third holder extends to the rear from a point where the body and chassis meet. The Cole inverts the position of the three holders, the centre member being at the top, in the middle of the rear deck, while the others are bolted to the sides of the body.

Little attempt has been made herein to do more than call attention to some of the most interesting innovations along this line. The list might be extended to include dozens of others. The situation may be regarded as one in which the American designer has sought to present an attractive solution of an interesting problem.

There is little doubt that the matter of body design is to play an even more important part in the history of the industry in the near future. In England there has been an increasing demand for greater attention to the presentation of attractive lines in body work. The recent productions in France and elsewhere on the Continent would seem to indicate that there is a wide diversity of opinion in this regard. It is worthy of note in this connection, however, that there has been a decided attempt to solve the extra tire or, as is more often the case abroad, the spare wheel problem, by utilizing the interior of the car, through an entrance at the rear.

This plan has the advantage of still further clearing the exterior of all superfluities, but there does not appear to be the same opportunity to adopt the practise in this country. The American motorist first of all demands a practical machine, and to fulfill this qualification it must be available for long distance touring. It follows that there is abundant reason for reserving as much space as possible within the car for the storing of luggage. Extra tires or spare wheels must be carried outside, and whether they are to remain on the running boards or are to be located at the rear undoubtedly will depend upon the designer's interpretation of the desires of the prospective purchaser.

Illustrating the Use of Individual Holders Attached to Chassis Frame: A, Pullman; B, Inter-State; C, Winton.



The tour of the Chicago Motor Club to Indianapolis for the annual 500-mile race will be in the nature of a reliability run in competition with the Illinois Athletic Club. The winning team will be awarded a trophy, which will remain with the club for one year. Chairman Herrick of the contest board has appointed E. G. Westlake, referee; E. C. Racey, H. Bosch and L. A. Watts, judges, and John De Long, starter.

IN THE COMMERCIAL VEHICLE FIELD.

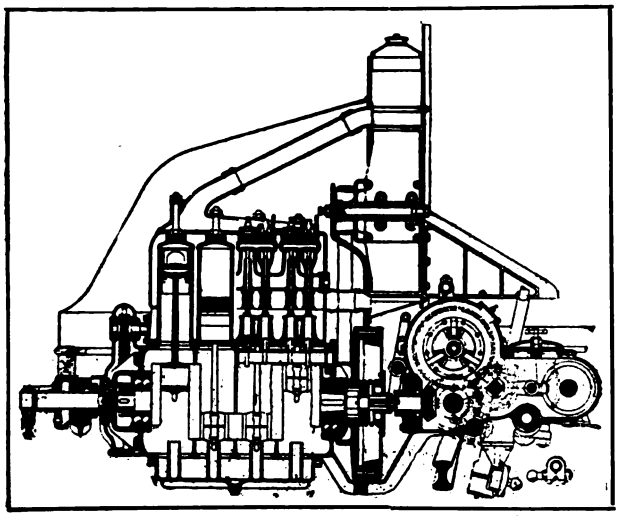
Constructional Features of Walter-Latil Front Drive Trucks, Made in America Under License from French Patentees---News of the Mechanical Transport.

CONSIDERABLE interest attaches to the new Walter-Latil front wheel drive trucks, made by the Walter Motor Truck Company, New York City, which recently acquired the American rights to manufacture under the patents issued by France to Latil Freres. The first machine of this type was produced in France some nine years ago, and the design has long been recognized as one of the standard constructions in Europe. Primarily it comprises a chassis carried on two wheels, which may be coupled to any form of rear equipment, and from which it may be detached conveniently, or it may include an entire

Front Wheel Drive as Applied to Walter-Latil Truck.

vehicle. It is understood that the Walter company contemplates the construction of vehicles in three sizes, which will range from one to five tons.

The claims are made that with about 80 per cent. of the load taken on the rear wheels, and with practically a constant load carried on the front wheels, the machine has unusually easy riding qualities; that the front wheel drive minimizes skidding; that brakes may be used on both front and rear wheels independently or in combination on all four wheels, and that with the chassis construction the entire mechanism is accessible at all times, no matter whether or not the vehicle is loaded. It also is maintained that a smaller engine will afford a satisfactory speed and hill climbing capacity.



Two types of chassis are built in France, one for vehicles with capacity ranging from one to three tons, and the other for capacities of four and five tons. With either the power transmission is identical, but the other details of construction differ. The sketches herewith present the smaller type.

The engine is a four-cylinder unit, the cylinders being cast en bloc, with bore of 3.35 inches and stroke of 5.5, rated at 18 horsepower. The valves are all arranged on one side. The camshaft is chain driven and is provided with a jockey pulley adjustment. Lubrication is by a combination of the pump and splash systems, the pump taking oil from a sump in the crankcase to a reservoir on the dash, whence it is forced through separate leads to troughs cast in the lower portion of the crankcase into which the big ends dip. Ignition is by Bosch high-tension magneto. Cooling is by thermo-syphon, the radiator being mounted in front of the dash. In addition a fan is carried on a shaft fitted with ball bearings and driven by means of a belt from a pulley cast on the front of the flywheel. In order to make the engine as compact as possible, the crankshaft has no centre bearing, but double ball bearings of ample size are housed at each end of the crankcase and carry the crankshaft. The camshaft also runs on ball bearings.

The change speed gearing and differential are enclosed in one case bolted to the rear of the crankcase, the use of a long clutch shaft and universal joints being eliminated. In this case the leather faced cone clutch slides on a short shaft, which drives the main gearshaft by means of bevel gearing. The main shaft and the layshaft run at right angles to the motor. Four forward speeds and reverse are provided, the high speed being direct to the differential. The speed changes are effected by means of a lever operating in a "tramway," and the drive to the differential is by spur gearing. Both gearshafts run on ball bearings and felt oil retainers are provided wherever necessary.

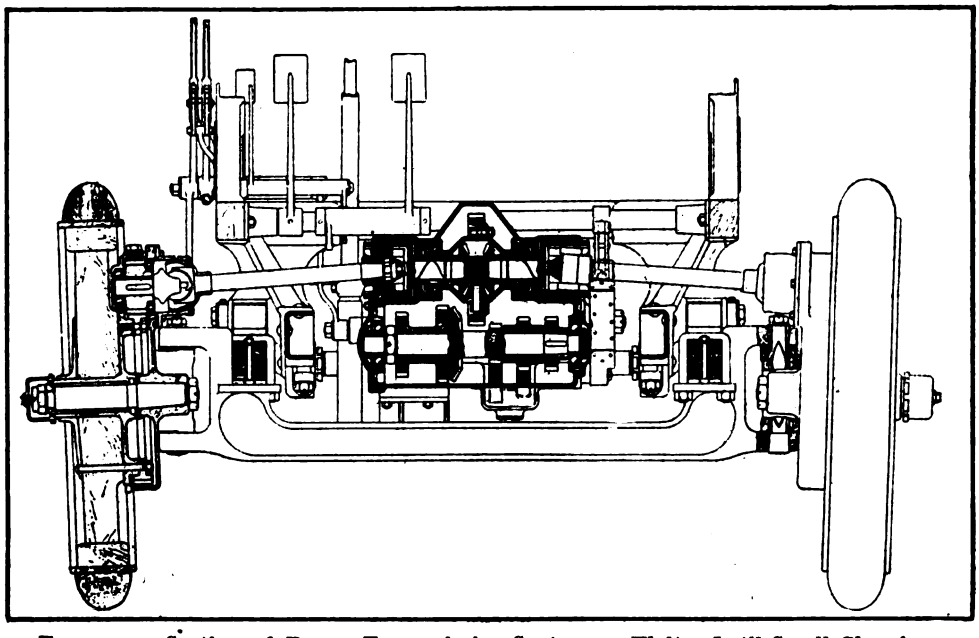
The drive from the differential to the road wheels is taken through two cardan shafts, each

Digitized by Google

Longitudinal Section of Power Transmission System on Walter-Latil Small Type Chassis.

fitted with two universal joints. The joints at the ends of the shafts nearest the wheels are of the ball and socket type, and are enclosed in grease cases. The angle of these two shafts is not great, a feature which is held to make for little loss of power in friction at the joints. In order to allow for variation in the angle of the cardan shafts, the joints nearest the differential gear are made so as to permit considerable end travel. As a precaution against the forks coming out of mesh with the ball joints, springs are inserted between the ends of the shafts and the universal joint boxes.

The ball bearings of the pinions which drive the gears attached to the two front wheels are housed in castings, which also carry stub axles and the arms to which the steering rods are attached. These castings, which serve in some measure as dust covers to the pinions and gears, swivel between the jaws of the main portion of the front axle.



The engine and gears are suspended from three points. Two arms extending downward from the two main longitudinal members are secured to the gearbox, and a bracket attached to the front cross members and terminating in a socket, into which fits a ball secured to the front of the crankcase, carried the motor. The steering gear is of the usual worm and segment type. The foot brake acts upon a drum carried on an extension of the speed gearshaft and takes effect upon the front wheels. A side lever operates band brakes on the rear wheels. When steel tires are utilized at the rear the brakes are arranged to act upon the rims.

TRUCKS IN STRIKE EMERGENCY.

Unusual Demonstration of Economy and Practicability of Mechanical Transport.

Recently the teamsters employed by six coal and lumber dealers in Pawtucket, R. I., inaugurated a strike because their demands were not met. At the end of the first week the men applied for their old jobs, only to find that motor trucks had replaced the horse drawn equipment with four of the concerns.

The experiment is believed to have been the first in America in which mechanical transports have been used in a similar emergency, and as officials of the firms interested or members of their families drove the trucks in each instance, the demonstration was of a character best calculated to warrant definite conclusions, and they were found productive of decided economy, despite the lack of means for loading and unloading.

SOME INTERESTING DUMPING BODIES.

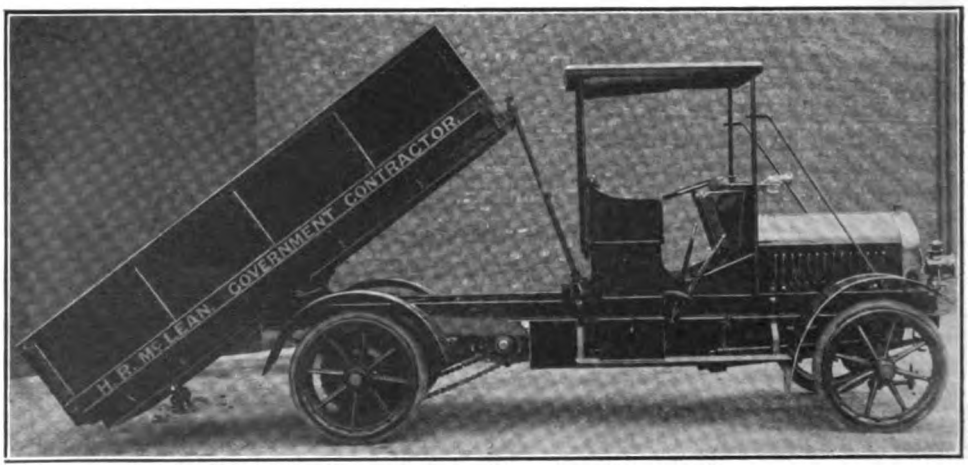
TWO types of tipping bodies as produced by British constructors are presented herewith. Both of these are built for colonial service and

Lacre Steel Dumping Body in Service with Municipal Authorities at Johannesburg, South Africa.

the dumping mechanism is operated by power from the motor.

The Lacre body is of steel and is the product of the Lacre Motor Car Company, Ltd., Letchworth, Hertshire, England. It was built for the city officials of Johannesburg, South Africa, where each of these vehicles replaces 12 Scotch carts and 20 mules in collecting and disposing of refuse.

The chassis is a regulation Lacre four-ton, fitted with a 38 horsepower, four-cylinder, water-cooled motor. For use with this body the frame is shortened a trifle and stiffened at the rear to permit of tipping. The dimensions are: Length, about 12 feet six inches; width, seven feet; depth, two feet nine inches. The rear portion is so arranged that when the vehicle is tipped it opens automatically, and it is held closed by a lever when in normal position. The screw hoist is of the telescopic type and permits the body to be elevated to an angle of 45 degrees.



The Albion dumper is made by the Albion Motor Car Company, Ltd., Scotstoun, Glasgow, Scotland, and is constructed to carry a load of three tons. The vehicle shown was delivered to a government contractor on the Island of Trinidad. The dumping mechanism is operated by the motor, a winding drum being fitted at slight extra expense if specified when ordered.

Another feature in connection with this second machine lies in that the company is prepared to furnish a kerosene carburetor upon option. The general principle upon which this vaporizer operates is that the fuel is fed by the usual type of float chamber to a jet and is atomized by the inrushing air. Only a small proportion of the air is taken over the jet, and the rich mixture of air and atomized kerosene is immediately conducted to a chamber having a very large corrugated heated surface, the heating being accomplished by the exhaust gases. The rich gas from this chamber is led to a double-beat mixing valve controlled by a governor, which in conjunction with the speed air valve is held to permit under all conditions of load and speed the correct amount of additional air to enter with the rich vapor to insure the most efficient and economical mixture reaching the engine.

DOW DUAL WHEEL.

A Construction Which Is Held to Make for Material Reduction in Tire Expense.

The Dow Wheel Company, New York City, is demonstrating a dual wheel equipment, the in-

Contractor's Tipping Body on Three-Ton Albion Chassis for Use on Island of Trinidad.

Digitized by Google

vention of Alexander Dow, which is expected to make for a material reduction in tire expense. It is further claimed that the system practically eliminates all possibility of skidding. The accompanying illustration shows the equipment as applied to a five-ton Mack truck.

The invention is an adaption of the bogey truck principle. The regular vehicle axle has mounted on the spindles what is known as an equalizing bar, and in the Dow construction this bar is so shaped that at either end is fitted an axle spindle on which is mounted a wheel in the usual manner. But the wheels overlap, the forward member being sufficiently outside that at the rear to insure good clearance. Both wheels are driven from a jackshaft sprocket and a brake operates on each.

The design gives four points of support to the rear axle instead of two, and the change of any one of these greatly reduces the movement of the axle and the consequent spring action is minimized. The tread of the vehicle is increased but an inch or two and the overlap of the wheels gives a distance of perhaps 21 inches with 36-inch wheels between the two lines of support. It is maintained that this construction can be adapted to front wheels should this be desired.

AUTOMOBILES FOR PARCEL POST.

Retiring Postmaster-General Recommends Awarding Contracts for 100 Machines.

One of the last official acts of the retiring Postmaster-General Frank H. Hitchcock before he was succeeded by Albert Burleson, was to sign the recommendation of a special committee awarding contracts for furnishing 100 motor vehicles for the parcel post service. They may be ordered during the fiscal year ending June 30, and are to be distributed throughout the country. The contracts awarded are as follows:

The White Company, five White 1500-pound wagons; Stewart Motor Corporation, 10 Stewart 1500-pound; Kissel Motor Car Company, 10 KisselKar 1500-pound; Durant-Dort Carriage Company, 10 Flint 1600-pound; Louis J. Bergdoll Motor Company, 10 Bergdoll 1500-pound; Atterbury Motor Car Company, 10 Atterbury 1500-pound; Willys-Overland Company, 10 Overland 900-pound; Studebaker Corporation, 20 Studebaker 750 and 1000-pound; C. B. B. Motor Car Company, 10 Modern 1000-pound; Waverley Company, five Waverley electric 1000-pound; Kentucky Wagon Manufacturing Company, five Urban electric 1000-pound; Ward Motor Vehicle Company, five Ward electric 1000-pound; Baker Motor Vehicle Company, five Baker 1000-pound.

WITH MOTOR TRUCKS IN SERVICE.
